
GRAY, ORMSON, AND BROWN, Danvers-street, Chelsea, solicit the attention of the Nobility, Gentry, and Gardeners, to their superior manner of Erecting and Heating every description of Building connected with Horticulture. The work done by them at the Right Hon. the Earl of Kilmorey's, to which they have had the honour of referring so long, still continues to give perfect satisfaction. Mr. Kinghorn will be happy to show the work and give any information.

They also beg to refer to the houses built by them during the past season, for the Worshipful Apothecaries' Company of London, in their Botanic Garden at Chelsea. Mr. Moore, the Curator, will kindly show the work, and answer any enquiries. They beg also to say the Building only is referred to, as the Heating Apparatus was not erected by them.

GRAY, ORMSON, and BROWN have also the honour of referring to many of the nobility and gentry in the country, and to several of the London Nurseries.

N.B. Plans and Estimates furnished free.

TO NOBLEMEN and GENTLEMEN who require a plentiful and CONSTANT SUPPLY of PURE WATER at their Country Mansions.

Messrs. EASTON and AMOS beg to offer their improved PATENT HYDRAULIC RAM, which is perfectly self-acting, and without manual labour is capable of lifting water to 30 times the height of the waterfall by which it is worked.

THIS MACHINE CAN BE APPLIED WHEREVER A FALL OF WATER OF A FEW FEET CAN BE OBTAINED, and its cheapness and durability, with the fact that upwards of 500 of them erected in England and other countries by Messrs. EASTON and AMOS have now been at work many years, afford ample proof of its great value and efficiency.

Estimates of the expense of the Machine, Pipes for the conveyance of Water, Tanks, and Reservoirs, may be had on application to Messrs. EASTON and AMOS, CONSULTING ENGINEERS to the ROYAL AGRICULTURAL SOCIETY, at their office in Orange-street, Trafalgar-square, or at the Works in the Grove, Southwark, London.

SUPERB NOVELTIES IN PAPIER MACHE, at MECHI'S, 4, Leadenhall-street, London.—A visit to his establishment will prove that there is not in London another such stock of Elegancies. They consist of caddies, tables, envelope cases, netting boxes, companions, cabinets, jewel cases, work boxes, dressing cases, tea caddies, hand and pole screens, card racks, table inkstands, regency writing desks, portfolios, playing cards, and visiting card cases, cigar and bottle cases, note and cake baskets; also an assortment of needle cases in pearl and tortoiseshell, silver and gold pencil cases, pen holders, and other articles suitable for presents. Inventor of the patent castellated tooth-brush.

DESTRUCTIVE ANIMALCULÆ.

READ'S GARDEN ENGINES AND MACHINES.—As spring approaches, the larvæ of destructive insects are propagated in infinite multitudes, and impregnate with millions of insects the very air we breathe, to the great injury of the young shoots of trees, Vines, plants, and every species of vegetation put into motion and growth by the genial influence of the season.—RICHARD READ, Instrument Maker (by special appointment) to her Majesty, begs to inform Amateur and Practical Gardeners, &c., that he has made considerable improvements in his Garden Engines and Machines, which are now so perfect that he will warrant the valves to keep in repair during the term of the patent. Manufactured only at 35, Regent-circus, Piccadilly.

STAMPED TO GO FREE BY POST.

BASS AND BROWN'S SEED AND PLANT LIST, or GENERAL DESCRIPTIVE PRICED SPRING CATALOGUE, will be supplied gratis on application.
Seed and Horticultural Establishment, Sudbury, Suffolk.

CONVERSATIONS on LAND and WATER, for Children. By Jane Marcet.
"This work consists of desultory Conversations with a family of children from six to ten years of age, in which the author has endeavoured to mingle information with amusement, and to teach the youthful student of Geography that there are other matters connected with land and water quite as interesting as the names and situations of the different parts of the earth. Two new Conversations have been added to this edition, containing the 'Adventures of a Drop of Water.'"—*Preface.*
By the same Author, New Editions of
CONVERSATIONS on CHEMISTRY. 2 vols. 14*s.*—On VEGETABLE PHYSIOLOGY. 9*s.*—On NATURAL PHILOSOPHY. 10*s.* 6*d.*—On POLITICAL ECONOMY. 7*s.* 6*d.*

New Edition, corrected to Michaelmas Term, 12 and 13 Victoria.
"This valuable and popular digest of the laws of England has just reached its fifteenth edition.....The additions all tend greatly to enhance the utility and value of a most useful and serviceable volume."—*Morning Advertiser.*
"We pronounce it one of the most useful books of reference that can find a place in the library of the landlord, tenant, lodger, merchant, tradesman, author, artist, professional man. No matter what one's rank or station may be, it is a guide on all emergencies."—*Observer.*
London: Longman, Brown, Green, and Longmans.

In fcp. 8vo, with Plates and Woodcuts, price 7*s.* 6*d.* cloth,
MISS ACTON'S MODERN COOKERY-BOOK. For the use of Private Families. The Ninth Edition, with Directions for Carving, and other Additions and Improvements.
"The whole of Miss Acton's recipes, 'with a few trifling exceptions, which are scrupulously specified, are confined to such as may be perfectly depended on, from having been proved beneath our own roof, and under our own personal inspection.' We add, moreover, that the recipes are all reasonable, and never in any instance extravagant. They do not bid us sacrifice ten pounds of excellent meat, that we may get a couple of quarts of gravy from it; nor do they deal with butter and eggs as if they cost nothing. Miss Acton's book is a good book in every way; there is right-mindedness in every page of it, as well as thorough knowledge and experience of the subject she handles."—*Medical Gazette.*
London: Longman, Brown, Green, and Longmans.

This day is published in one vol., price 6*s.* 6*d.*
WOMAN'S FRIENDSHIP. A Story of Domestic Life. By Grace Aguilar, Author of "Home Influence."

Of whom may be had,

I.
PROFESSOR LOW'S APPEAL TO THE COMMON SENSE OF THE COUNTRY, AND EXPOSITION OF THE EFFECTS OF WHAT IS CALLED FREE TRADE ON BRITISH AGRICULTURE, and the CLASSES dependent on it. Price 3*s.*; 3*s.* 6*d.* by post.
"Tracing the effects of Free Trade to their remoter consequences upon the general economy of the country, and upon its relations to its colonies and to foreign lands, he establishes a case against which no sophistry of the Economist school can for a moment stand."—*John Bull.*

II.
Second Thousand.
PETER PLOUGH'S LETTERS TO LORD KINNAIRD ON HIGH FARMING AND FREE TRADE. Price 1*s.*; by post, 1*s.* 4*d.*,
"If any one of our readers entertains a doubt as to the unsoundness of the opinions advanced by Lord Kinnaird in his lately published pamphlet, we would advise him to read and ponder the facts and arguments of Peter Plough. Truth is more than a match for the sophisms and assumptions of the noble lord."—*Bell's Messenger.*

III.
Second Thousand.
LANDLORDS' RENTS AND TENANTS' PROFITS. By David Monro, Allan by Tain. Price 1*s.*; by post, 1*s.* 4*d.*
"A modest, sensible production, and deals very summarily with Mr. Caird's *brochure*. . . . On Mr. Monro's opinion, although we know nothing of the writer, we are inclined to place far more reliance, apart from our own judgment of his statement, on account of the simple, sincere, unpretending, and business-like style of the pamphlet."—*Aberdeen Journal.*

Just Published,
THE FARMERS' AND GARDENERS' GUIDE TO THE ANALYSIS OF SOILS AND MANURES, AND TO THE PRACTICAL APPLICATION OF AGRICULTURAL CHEMISTRY. By John Martindale.
London: Darton and Co., Holborn-hill, and all Booksellers. Price 3*s.* 6*d.*, neatly bound in cloth.
"In our opinion both gardeners and farmers cannot do better than to make themselves well acquainted with the 'Guide' thus offered them."—*Gardeners' Chronicle and Agricultural Gazette, Sept.* 8, 1849.
"The book teems with good advice and useful information."—*The Country Gentleman, Jan.* 7, 1850.
"No improving farmer ought to be without it for a single week."—*Durham Chronicle.*
"Decidedly the most simple and concise treatise that has appeared on the subject."—*Darlington and Stockton Times.*
"Assay Office and Laboratory, Newcastle-on-Tyne, Sept. 27, 1849.
"I have read Mr. Martindale's 'Farmers' and Gardeners' Guide to Agricultural Chemistry' with great pleasure. It is an excellent compendium, and embraces all our present information in this branch of applied chemistry, arranged in a very methodical manner, and well adapted for parties just commencing the study of this science.
(Signed) "Thomas Richardson, Ph.D.
(and Lecturer on Chemistry in the School of Medicine, Newcastle-on-Tyne)."

PARR'S LIFE PILLS.—"Many would fain occasionally use medicine to assist Nature in her operation, but like a mariner at sea without his compass, knowing not where to steer, they first try this, and then that, and meet with nothing but disappointment; to these, how welcome must be the important fact, that PARR'S LIFE PILLS are now proved to be all that are required to conquer disease and prolong life."
1. They increase the strength, whilst most other medicines have a weakening effect upon the system. Let any one take from three to four or six Pills every 24 hours, and, instead of having weakened, they will be found to have revived the animal spirits, and to have imparted a lasting strength to the body.
2. In their operation they go direct to the disease. After you have taken six or twelve Pills, you will experience their effect: the disease upon you will become less and less by every dose you take; and if you will persevere in regularly taking from three to six pills every day, your disease will speedily be entirely removed from the system.
None are genuine unless the words "PARR'S LIFE PILLS" are in white letters on a red ground, on the Government Stamp, pasted round the box; also, the fac-simile of the Signature of the Proprietors, "T. ROBERTS and Co., Crane-court Fleet-street, London," on the Directions.
Sold in boxes at 1*s.* 1½*d.*, 2*s.* 9*d.*, and family packets at 11*s.* each, by all respectable medicine vendors throughout the world. Full directions are given with each box. Sold by all Chemists.

METCALFE AND Co.'s NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1*s.* An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at Metcalfe, Bingley, and Co.'s Sole Establishment, 130 B, Oxford-street, one door from Holles-street.
METCALFE'S ALKALINE TOOTH POWDER, 2*s.* per box.
Caution.—Beware of the words "From Metcalfe's," adopted by some houses.

TURNIP AND BARLEY FARM.
TO BE LET, and entered on at Lady-day next, a desirable BARLEY and TURNIP FARM, in Gloucestershire, of about 160 acres, with a comfortable House for a small family, 30*s.* per acre and tithe free. About 50 acres more may be had. The South Wales Railway will pass through the Parish.—Apply by letter to Mr. Wm. Middleton, Post-office, Stamford, Lincolnshire.

THE HUMAN HAIR.—Of the numerous compounds announced for promoting the growth or reproduction of the human hair, few survive, even in name, beyond a very limited period, whilst ROWLAND'S MACASSAR OIL, with a reputation unparalleled, is still on the increase in public estimation. The unprecedented success of this discovery, either in preserving the Hair in its original strength and beauty, or restoring it when lost, is universally known and appreciated; and is recorded by testimonials most numerous in themselves, and certified by the highest authorities. It has obtained the exclusive patronage of royalty, not only as regards our own court, but those of the whole of Europe. From its exquisite purity and delicacy, it is admirably adapted for the hair of children, even of the most tender age, and is constantly in use in the nursery of royalty, and by the families of the nobility and aristocracy. It is alike suited for either sex, and, whether employed to embellish the tresses of female beauty, or to add to the attractions of manly grace and aspect, will be found an indispensable auxiliary to the toilet, both of ladies and gentlemen. Price 3*s.* 6*d.* and 7*s.*; or family bottles (equal to four small), at 10*s.* 6*d.*; and double that size, 21*s.*
On the wrapper of each bottle of the genuine article are these words, in two lines, ROWLAND'S MACASSAR OIL. Sold by A. Rowland and Sons, 20, Hatton Garden, London; and by all chemists and perfumers.

EMIGRATION to the AUSTRALIAN COLONIES.—For ADELAIDE, PORT PHILLIP, and SYDNEY, the fine, 1st-class, teak-built ship ORIENTAL, Capt. J. P. TAYLOR, 1000 tons, coppered and copper-fastened; will sail from the St. Katharine's Docks about the 5th March, calling at Plymouth. This very superior ship is fitted up expressly for the comfort and accommodation of passengers, with separate enclosed cabins of an extra size for families and married couples. She has upwards of 8 feet height in the 'tween decks, which are thoroughly lighted and ventilated. The passage money 20 guineas each adult, including bedding and mess utensils. There will be a library on board. She has a most magnificent poop and saloon, with elegant accommodation for cabin passengers. A skilful surgeon will proceed in the ship. For freight or passage apply to John Whittaker, 78, Mark-lane; or to W. R. Brufton, 39, Great Tower-street, London.

AUSTRALIA, NEW ZEALAND, CAPE OF GOOD HOPE, NATAL, &c.
PASSENGERS to the COLONIES generally may obtain their OUTFITS from S. W. SILVER and CO., CLOTHIERS, &c., 66 and 67, CORNHILL, at wholesale prices. SILVER and CO. make nearly the whole of the articles comprised in an outfit, to secure durability, so that the Cabin Folding Furniture may become permanent Household Furniture on arrival in the colony.
They also engage PASSAGES, and give ship sailing INFORMATION, but they neither receive nor pay a commission—their object being to give PASSENGERS who place themselves in their hands every benefit; and they forward small packages for their customers (gratis) through their AGENTS in the COLONIES.
SILVER and CO. give DRAFTS on AUSTRALIA at sixty days' sight of 103*l.* for every 100*l.* paid here.
The EMIGRANT Fitting-out Branch is at No. 4, Bishopsgate-street, opposite the London Tavern, where a comfortable fit-out for male or female, including bedding, may be obtained for FOUR POUNDS.
A Branch of each at ST. GEORGE'S-CRESCENT, LIVERPOOL.

COUGHS EFFECTUALLY CURED.—BRANDE'S BRONCHIAL SEDATIVE: a specific for Coughs, Bronchitis, Asthma, Influenza, and all affections of the Chest and Throat. The influence of this medicine pursues the exact track of the inflammatory action causing cough. First soothing the glottis and epiglottis (the organs of voice) its sedative influence passes along the mucous lining of the windpipe unto the bronchii, and allaying pulmonary irritation, giving ease and comfort to the chest—restoring the voice to its accustomed clearness and power. Price 1*s.* 1½*d.* per packet, and 2*s.* 9*d.* per box; equal in medicinal effect to two of any other preparation for coughs, &c. &c. Sold by Sanger and Hannay, in Oxford-street: and by all respectable Chemists and Medicine Vendors in the Kingdom; or a packet will be sent free by post in return for 15 penny stamps, by the Proprietor's Agent, John Willis, 24, East Temple Chambers, Fleet-street, London.—Agents wanted.

RANUNCULUSES AND ANEMONES should be planted without delay. By addressing as under, fine named varieties can be had, post free, for 6*s.*, 9*s*, and 12*s.* per dozen.

IMPORTED SEEDS.—German Asters, Stocks, Zinnias, Larkspurs, &c., 2*s.* 6*d.* per named assortment. CHOICE ANNUALS, 25 varieties, post free, 5*s.*

Descriptive Catalogues of Ranunculuses, Carnations, Picotees, Pinks, Dahlias, &c. can be had by forwarding two post stamps.

Address, CAREY TYSO, Florist, &c., Wallingford, Berks.

ROSES.

ROSES established in 24 pots for immediate forcing. (See catalogue for two penny stamps.) Hybrid Perpetuals, the finest of all for this purpose, 1*l.* per dozen.

H. LANE and Son, Great Berkhampstead, Herts.

SEEDS.—A few select Seeds from the original raisers, which have now for several years given such general satisfaction to those who have grown them, viz.:

Elletson's (true) large Mammoth or April White Broccoli.
Elletson's (true) improved Wilcove White Broccoli.
Lindsay's imperial crimson Dwarf Beet.
Usher's "Exquisite" Curled Parsley.
Metcalfe's improved Dwarf Walcheren Broccoli.
Telford's superb early Dwarf Cabbage.

The above may be had at 1*s.* each, or the six sorts for 5*s.*, in Post-office order or postage stamps, on application to WILLIAM MAY, Hope Nurseries, Bedale, Yorkshire. W. M. begs to refer to former *Chronicles* for his Advertisements of select Pansy, Cineraria, Antirrhinum, and Hollyhock Seeds; also to his superb collection of hardy Herbaceous Plants, Hollyhocks, &c.

THE READING GIANT ASPARAGUS.—Strong Plants, 3 years old, 4*s.* per 100; 2 years old, strong, 3*s.* per 100. No charge for package. The above is decidedly the best kind of ASPARAGUS, a large quantity being sent annually at a high price to Covent-garden Market. With small orders a remittance by Post-office order, *or penny postage stamps*, will oblige.

Fine Brown Cos Lettuce plants, 1*s.* 6*d.* per 100.
New Prolific Hautbois Strawberries, 5*s.* per 100.
Address, JOHN SUTTON AND SONS, Reading, Berks.

PELARGONIUMS AND NEW PLANTS, MANY OF THEM FROM CALIFORNIA AND CHINA.

H. GROOM, Clapham Rise, near London, by Appointment FLORIST TO HER MAJESTY THE QUEEN, and to HIS MAJESTY THE KING OF SAXONY, begs to say that his CATALOGUE OF PELARGONIUMS AND NEW PLANTS is ready, and will be forwarded by post on application.

MITCHELL'S ROYAL ALBERT RHUBARB still has its supremacy over all other kinds for its extraordinary earliness, delicious flavour, and splendid red colour; also a most prolific bearer and free grower, with large stalks. For early forcing it far surpasses every other variety. For making wines, preserves, and all culinary purposes, it is an inestimable production. Strong one-year planted roots 1*s.* 6*d.* each; also Myatt's Linnæus, 1*s.* 6*d.*; and Victoria, 9*d.* The usual allowance to the trade. Post-office orders made payable to WILLIAM MITCHELL, Enfield Highway, Middlesex, will meet with prompt attention. N.B. The above is from four to five weeks earlier than the well-known Victoria.

SAMUEL FINNEY AND CO.'S NEW CATALOGUE OF SEEDS is now ready, and will be forwarded gratis on the receipt of two penny stamps for postage. In forming our Collections of Seeds we have taken special care to include all the select and most approved kinds, and such as we can confidently recommend.

Of VEGETABLE SEEDS, our Collections contain a full supply of all that is requisite for the largest establishment, and the kinds and quantities for each collection are stated. No. 1, 2*l.* 10*s.*; No. 2, 1*l.* 10*s.*; No. 3, 1*l.*; and No. 4, 12*s* 6*d.*

Of FLOWER SEEDS, we have included all the most choice and showy kinds, particularly those we know to succeed well in the north, and a full list of all the best kinds of German Seeds, imported direct in sealed packets, with prices.

A Collection of 100 packets of the best hardy and half-hardy kinds for					15*s.* 0*d.*
Ditto	of 50	ditto	ditto	ditto	8 0
Ditto	of 25	ditto	ditto	ditto	5 0

We particularly recommend this Catalogue to residents in the north, as they will be enabled to purchase to advantage. All orders delivered free of carriage at any of the railway stations between Newcastle and York, Berwick and Carlisle, and by steam-boat to London, Hull, Whitby, Leith, Dundee, and Aberdeen. Railway and water communication to all parts of the kingdom.

SAMUEL FINNEY and Co., Gateshead, near Newcastle-on-Tyne

EXHIBITION OF CAMELLIA JAPONICA.—A Collection of these beautiful Exotics is now in bloom at CHANDLER and SON'S Nursery, Vauxhall, London.

Admittance gratis.

VERBENA—"WONDERFUL."

G. MOORE begs to refer the readers of this Paper to his Advertisement of the 2d inst.

Perry Barr, near Birmingham, Feb. 23.

CHOICE FRUITS, &c. &c..

YOUELL AND CO. beg to call the attention of those gentlemen now about planting or replenishing their Fruit and Kitchen Gardens to the following choice articles:

TRUE FASTOLFF RASPBERRY.

Y. and Co. beg to announce they are now executing orders for the above in fine strong Canes of the same stock as they had the honour of supplying Her Majesty's Gardens and most of the Nobility. 15*s.* per 100.

Fine large WHITE RASPBERRY, 3*s.* per dozen.

CORNWELL'S VICTORIA DITTO, 12*s.* 6*d.* per 100.

PEACHES, NECTARINES, AND APRICOTS, 3 years trained, and forward for bearing, 5*s.* each.

CHERRIES AND PLUMS, 3 years trained, 3*s.* 6*d.* each.

PEARS AND APPLES, fine Espalier, 24*s.* per dozen.

The above are of the most select kinds, and worked from the Stock of the Horticultural Society of London, and are warranted correct to their sorts.

STURMER AND ANGLESEA PIPPIN, fine Espalier, 24*s.* per dozen; Standards, 1*s.* 6*d.*; Dwarfs 1*s.* each.

GOOSEBERRIES, in 12 of the best kinds selected for size and flavour, 5*s.* per dozen.

CURRANTS, improved large White Dutch, 5*s.* per dozen.

DITTO, Black Naples, 5*s.* per dozen.

DITTO, large Red Grape, 4*s.* per dozen.

STRAWBERRIES.—Myatt's Eleanor, 10*s.* 6*d.*; Globe, 7*s.* 6*d.*; Pine Apple, 5*s.*; Prolific, 5*s.*; Mammoth, 7*s.* 6*d.*; British Queen, 3*s.* 6*d.*; Cuthill's Black Prince, 10*s* 6*d.*; Coul Late Scarlet, 3*s.* 6*d.* per 100, with many other fine sorts.

RHUBARB.—Myatt's Linnæus, 1*s.*6*d.*; Mitchell's Prince Albert, 1*s.* 6*d.*; Myatt's Victoria, 1*s.* each. Toboisk (earliest), 9*s.* to 12*s.* perdozen.

ASPARAGUS.—Giant (strong), 2 and 3 years, 2*s.* 6*d.* and 3*s.* 6*d.* per 100.

SEAKALE (strong), 1*s.* 6*d.* per dozen.

WHITETHORN, 3 years old, very fine and clean, 2*s.* 6*d.* per 1000; fine 2 and 3 years transplanted, 6*s.* 6*d.* and 8*s.* 6*d.* per 1000.

THE FINEST CARNATIONS, PICOTEES, AND PINKS.

YOUELL AND CO.'S Extensive and Celebrated Collection of the above are this season unusually strong and healthy, and are ready for sending out, in fine well-rooted plants, to any part of the United Kingdom, or for exportation, at the following prices:

25 pairs of finest first-rate show varieties of Carnations and Picotees			£5	0 0
12 pairs	do.	do.	2	10 0

(Including their fine Red-eyed Picotee, "The Gem," by far the most perfect Picotee yet raised, and shewn in all the winning stands at the Metropolitan Exhibitions during last season.)

25 pairs of very fine show varieties of	do.	do.	3	0 0
12 do.	do.	do.	1*l.* 4*s.* to 1	10 0
Fine mixed border ditto—per dozen pairs			0	12 0
True old Clove—per pair			0	2 0

PINKS, finest first-class show flowers, 12*s.*, 18*s.*, and 24*s.* per dozen pairs.

PANSIES, the finest first-class show flowers, comprising all those exhibited in the winning stands at the Metropolitan Exhibitions, 10*s.* to 18*s.* per dozen, well established in small pots, or per post, free.

CAMELLIAS of the newest and best kinds, with flower-buds, 30*s.* per dozen.

CINERARIAS, do. do., 12*s.* to 18*s.* per dozen.

ERICAS, comprising the best spring-flowering kinds, 12*s.* to 18*s.* per dozen.

ROSES, Standards, Half-standards, and Dwarfs, of the finest kinds in cultivation, 12*s.* to 15*s.* per dozen.

30 packets of new and very choice Flower Seeds, 6*s.* per post, free.—Nursery, Great Yarmouth.

PLANTING SEASON.

ALFRED BALSTON begs to inform planters he has still a large proportion of his Nursery Stock to dispose of, which, in consequence of having relinquished the trade, he offers at very reduced prices. The Stock comprises every variety of ORNAMENTAL, FRUIT, and FOREST TREES, and all the best kind of SHRUBS in cultivation, no expence having been spared in the collection, and from the light nature of the soil in which it has grown, the plants have all a mass of fibrous root, which causes them to grow most luxuriantly after being transplanted.

A.B. particularly recommends the following: Common Laurel, 9 inches to 1 foot, 15*s.*; 1 to 2 feet, 30*s.*; 2 to 4 feet, 40*s.*; 4 to 6 feet, 80*s.* per 1000. Portugal Laurels, 1 to 2 feet, 10*s.* per 100. Rhododendron ponticum, 1 to 2 feet, 30*s.*; 3 to 4 feet, 60*s.*; 4 to 5 feet, 100*s.* per 100. Ghent Azaleas of all the finest kinds, specimen plants, 2*s.* 6*d.* each; smaller ditto, 6*s.* per dozen. Rhododendron campanulatum, caucasicum, catawbiense, &c., 100*s.* per 100. Standard Roses of all the finest sorts, 12*s.* per dozen. A large stock of Evergreen Oak in pots and transplanted; also common Oak, Elm, Beech, Birch, Berberis, Hornbeam, Privet, &c.

Orders must be accompanied by remittances. Orders amounting to 5*l.* delivered free.—Poole Nursery, Dorset.

SCOTCH FIR SEEDLINGS.—The Subscribers have still to dispose of from three to four millions of 2-year Seedling SCOTCH FIRS, partly from native and partly from common seed, prices of which (varying according to quantity taken), may be had on application.—HOWDEN BROTHERS, Inverness Nurseries, Feb. 23.

N.B. Inverness has direct communication by steam with London, Edinburgh, Glasgow, &c.

A. VAN GEERT, NURSERYMAN and FLORIST, Ghent, Belgium, begs to inform his friends and the trade generally, that his New Catalogue of Plants for 1850, is just published, and may be obtained on application to his Agents, BETHAM and BLACKITH, Cox and Hammond's Quays, Lower Thames-street, London.—Ghent. Feb. 23.

TO NURSERYMEN, FLORISTS, AND OTHERS.

BETHAM AND BLACKITH (late JOHN BETHAM), CUSTOM-HOUSE, SHIPPING, INSURANCE, and GENERAL FORWARDING AGENTS, beg to inform the above that they continue to receive and forward consignments of Plants, Seeds, and General Merchandize, with due regard to economy and expedition. Constant communication maintained with all the Continental Nurseries, and information given respecting the arrival and departure of the vessels.—Address, Cox and Hammond's Quays, Lower Thames-street, London.

RENDLE'S DESCRIPTIVE CATALOGUE OF SEEDS can still be obtained GRATIS, on receipt of two penny stamps, to pay the postage.

OPINIONS OF THE PRESS.

Dr. LINDLEY, in the *Gardeners' Chronicle*, Dec. 22, 1849, says, "*This contains lists of good vegetables, with useful notes appended to the names of many of the sorts. . . . It is a well-arranged Catalogue, and will be found of service to all purchasers of Seeds.*"

The Editor of "The Midland Florist," for January, 1850, says, "*We have just received the General Catalogue of Garden, Agricultural, and Flower Seeds, sold by William E. Rendle and Co., Plymouth, which, from its excellence, well merits something more than a passing notice, and happy shall we be from time to time (with Messrs. Rendle's permission) to extract some of its valuable information for the benefit of our readers. . . . The Flower Seed List is peculiarly comprehensive, and gives to each variety its scientific name, hardihood, time of duration, colour, height, and time of flowering. Our readers will thus see that, from its immense utility, we can scarcely say too much in its recommendation; and we are sure that the name of the eminent firm will be a sufficient guarantee that every article they send out will not only be true to name, but also of the best possible quality.*"

Apply to WILLIAM E. RENDLE and Co., Seed Merchants, Plymouth.

MESSRS. J. AND H. BROWN offer to the Nobility and Gentry the following plants, &c., which they can forward from London to any part.

Flower Seeds, 18 papers, 5*s.*; 36 ditto, 10*s.*; of the most approved varieties, sent free by post. Also Catalogues for 1850. Albion Nursery, Stoke Newington, London, Feb. 23.

ORANGE, LEMON, LIME, CITRON, AND SHADDOCK TREES.—The first importation of the above Trees, in most excellent and healthy condition, has arrived from Italy. They are from 2 to 4 feet high in the stems, very straight, and possess strong grafts, and will make splendid trees in two or three years; from 12*s.* to 25*s.* each. They may be seen at A. COBBETT'S Italian and Foreign Warehouse, 18, Pall-mall, London. Also Catalonian, Azorian, and Arabian Jessamine Plants. The Double Italian Tuberose Roots are still on sale, 4*s.* per dozen.

TO PEAR GROWERS.

RENÉ LANGELIER, St. Helier, Jersey, begs to state that he has still to dispose of, Trees of BEURRE ST. HELIER, a very valuable sort for its long keeping and melting qualities. Also BEURRE DELAVAL, as well as GABOURELLE SEEDLING, which is a great bearer, and fit for kitchen use.

R. L. wishes to draw the attention of amateurs to his unrivalled Collection, of which the trees are of unusual vigour. R. L. can meet any orders for what has been before advertised in this Paper.

BROMHAM-HALL GREEN-FLESH MELON IS THE FINEST FLAVOURED IN THE WORLD.

EDWARD TILEY having become possessed of the whole stock of Seed of that very superior MELON called "BROMHAM-HALL GREEN-FLESH MELON," he is now sending out good sound Seeds at 2*s.* 6*d.* per packet of 6 seeds; larger do. of 15 seeds, 5*s.* per packet. For further particulars of the above, see Advertisement in this Paper, February 9th. Also the following fine varieties can be highly recommended:

	s.	*d.*	
Queen Melon	1	6	per packet.
Bowood Green-flesh	1	0	,,
Beechwood do.	1	0	,,

A packet of each of the three varieties, 5*s.*; if preferred, also a packet of Bromham-hall Melon will be included with the three Cucumbers for 7*s.*

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 16, Pulteney-bridge, Bath. A remittance must accompany the order, either in cash or penny postage stamps.

A BEAUTIFUL ORNAMENT FOR THE DRAWING-ROOM.
Send 24 penny postage stamps to

JOHN REID, Mount Scilla Nursery, near Chippenham, Wilts, and in return you will receive 12 Roots of DOUBLE LILY OF THE VALLEY, post free, to any part of the United Kingdom. The graceful habit and delicate appearance of the above Flower render it equally suitable for the Suburban Villa and the Nobleman's Parterre; while the delicious perfume it possesses will make it indispensable in the Lady's Posy and the Drawing-room Bouquet.

SEED POTATOES.

CHARLES SHARPE has much pleasure in announcing that he has got the under-mentioned sorts of POTATOES to offer again this season, which have for the last four successive years given general satisfaction in all parts of the kingdom. The first six sorts are very early and productive; those marked thus * are the best sorts for Frame Forcing; they are offered at the following prices, packing included:

Per bushel of 56 lbs.		Per bushel of 56 lbs.	
*Early Oxford Potatoes ...	8*s.*	Early Manleys*	7*s.*
*Early Round Frame ...	8*s.*	Early Cockneys	7*s.*
Early Ash-leaved Kidney	8*s.*	Fox's Seedling	7*s.*
Second Early Potatoes for Winter and Spring use:			
American Native Potatoes	5*s.*	Kentish Pink Kidney ...	4*s.*
York Regents	5*s.*	Forty Fold	4*s.*

Orders will be forwarded on the receipt of a Post-office order, and great care will be taken to ensure their safe delivery. A liberal allowance to the Trade.—Wisbeach, Cambridgeshire.

UNIVERSAL CATALOGUE OF VERBENAS, FUCHSIAS, DAHLIAS, CHRYSANTHEMUMS, PETUNIAS, &c.

G. SMITH'S Priced and Descriptive Catalogue contains the very best selections of the above; with a useful note and a marked List of the best Verbenas for exhibition in pots, with mode of training, and what is of great importance to exhibitors, the time of stopping back, so as to catch a sheet of bloom when it may be required; with descriptions of his superb Seedling Fuchsias, Verbenas, Petunias, &c.; and will be forwarded on the receipt of one postage stamp.—Tollington Nursery, Hornsey, Islington.

RENDLE'S TRUE WILLCOVE BROCCOLI.—*This superior variety has been proved by thousands to be the best late sort in cultivation, and can be recommended with much confidence. We have saved a small quantity this season on our own grounds, from some of the finest heads ever seen; price* 1*s.* *per packet, free by post.*

*** Twenty packets to the Trade for 12*s.*, or 50 for 2*l.* 10*s.* It will give the most complete satisfaction.

Our commercial stamp is on each packet.

COLE'S SUPERB RED CELERY, 1*s.* per packet.

Apply to WILLIAM E. RENDLE and Co.,
Seed Merchants, Plymouth.

FRUIT TREES, FLOWER-BEDS, &c.—Garden Netting, of superior quality, for preserving Fruit trees from frost, blight, and birds, or as a fence for rabbits, fowls, pigeons, Tulip and Seed beds, can be had in any length or quantity at 3*d.* per yard 2 yards wide, or 6*d.* per yard 4 yards wide, from JOHN KING FARLOWS, Fishing Rod and Net Manufactory, 5, Crooked-lane, London-bridge. The netting being tanned will stand exposure to the weather for many years. Forwarded to any part of the kingdom on receipt of post-office order, or reference in town. An allowance to gardeners and large consumers.—Copy the Address, 5, Crooked-lane, London-bridge.

EPPS' COLLECTIONS OF KITCHEN GARDEN SEEDS.

No. 1 contains the following quantities, and are of the best and newest kinds, being a sufficient supply for a nobleman's large establishment: 26 quarts Peas, 12 quarts Beans, 4 oz. Beet, 1 oz. Borecole, 6 oz. Broccoli, 1 oz. Brussels Sprouts, ½ oz. Buda Kale, 7 oz. Cabbage, 10 oz. Carrot, 2 oz. Cauliflower, 2 oz. Celery, 3 lbs. Cress, 4 pkts. Cucumber, 2 oz. Endive, 2 oz. Leek, 6 oz. Lettuce, 3 pkts. Melon, 2 quarts Mustard, 10 oz. Onion, 4 oz. Parsley, 6 oz. Parsnip, 2 oz. Savoy, 3 pints Radish, 1 oz. Scorzonera, 2 quarts Spinach, 2 lbs. Turnips, 1 pkt. Vegetable Marrow, 1 oz. Salsafy, and 12 pkts. Herbs, Chili, Capsicum, &c. £3 3 0
No. 2, two-thirds of the above 2 2 0
No. 3, one-third ditto 1 1 0
No. 4.—This collection is sufficient for a gentleman having a moderate sized garden 0 12 6

The great satisfaction these collections have given to some of the principal families in England, Ireland, Scotland, and Wales induces W. J. EPPS with confidence to solicit further patronage. The collections contain this year 15 per cent. more than last, and quite equal in quality. Descriptive Seed Catalogues may be had on application. All orders to be accompanied with a Post-office order from unknown purchasers. No charge made for packing, and delivered free of expense to any railway station in London.—Agricultural and Horticultural Seed Establishment, High-street, Maidstone.

*** Cole's Superb Dwarf Red Celery, 1*s.* per packet.

SAFFRON WALDEN.
SUPERB COLLECTION OF DOUBLE HOLLYHOCKS.

WILLIAM CHATER has a large and healthy stock of his unequalled collection of this splendid flower, and can supply good strong plants that will bloom well next autumn. For particulars, see printed Catalogue, which may be had on application by enclosing a postage stamp. Plants warranted true to name. A remittance requested on delivery of plants.

Post-office orders to be made payable at Saffron Walden.

EXHIBITIONS OF MELONS.

EDWARD TILEY begs to inform the Public that he will give a PRIZE of One Guinea for the best BROMHAM HALL MELON exhibited at the Chiswick Exhibition in July; and One Guinea for the best Bromham Hall Melon exhibited at the Regent's Park Exhibition in July. The money will be paid to the Committee before the exhibition. The above will prove to be the best Melon ever yet sent out. Sold in packets, seven seeds, 2*s.* 6*d.*, by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 16, Pulteney-bridge, Bath.

A remittance must accompany the order, either in cash or penny postage stamps to the amount.

FRUIT TREES AND SHRUBS AT HALF PRICE,
NOW ON SALE FOR FOUR WEEKS, BY
WILLIAM E. RENDLE AND CO., PLYMOUTH.

In consequence of the South Devon Railway Company having taken away a large portion of our Union-road Nursery, we are compelled to make some EXTENSIVE ALTERATIONS, *and as the whole of the ground must be cleared within four weeks, we have come to the determination of offering the stock at* HALF *the usual prices.*

PEACHES, NECTARINES, and APRICOTS.—Dwarf *trained* trees, 2*s.* 6*d.* each; smaller ditto, 1*s.* 6*d.* each; nice cut backs, 1*s.* each. A few very large trained trees in a bearing state, from 5*s.* to 7*s.* 6*d.* each, comprising Royal George, Noblesse, Chancellor, Newington, and some of the best sorts in cultivation.

PEARS.—Several hundred fine round-headed trees at 1*s.* 6*d.* each, worth 3*s.* 6*d.* and 5*s.* each, comprising all the best sorts in cultivation.

GRAPE VINES.—All the best sorts, 4 to 6 feet, 1*s.* 6*d.* each.

ARBUTUS.—Fine plants in pots, 12 to 18 inches, 5*s.* per doz.

ILEX OAK.—Fine plants in pots, and bushy, from 15 inches to 24 inches in height, 5*s.* per dozen, worth 1*s.* each. Four-year-old seedlings, out of boxes, SIXPENCE per doz.

BOX EDGING, 3*d.* per yard.

RASPBERRIES, "RENDLE'S LARGE BEEHIVE."—This is a large handsome variety, very prolific, and delicious flavour, and has given the most complete satisfaction. Strong Canes, 20*s.* per 100, or 3*s.* per doz. "YOUELL'S FASTOLFF," 10*s.* per 100.

CEDARS OF LEBANON.—We have a large stock of these in pots. Good plants, 3 feet, 36*s.* per dozen. Large handsome plants in pots, 4 to 6 feet, 5*s.* each; or one quarter the price usually charged.

BLACK NAPLES CURRANTS.—Very superior to the old sort, 6*s.* per dozen.

GOOSEBERRIES.—Some of the very best varieties in cultivation, 30*s.* per 100.

PORTUGAL LAURELS.—An immense stock will be sold unusually low. Fine plants, 18-inch, bushy, 20*s.* per 100; 3 feet, 30*s.* per 100; 4 feet, 40*s.* per 100.

BERBERIS, or MAHONIA AQUIFOLIA.—A very large quantity, 18 inches, 16*s.* per 100. This is a fine shrub for underwood.

Weigela rosea, strong plants, 12 inches, 6*s.* per dozen; Parnettia mucronata and floribunda, 6*s.* per doz.; Ribes, double red, and albidum, strong plants, 18 inches, 9*s.* per dozen.

Remittance, or reference in London, from unknown correspondents.

All orders above 5*l.* *will be delivered free of carriage to any of the stations on the South Devon, Bristol and Exeter, or Great Western Railways. Steamers from this port to London, Dublin, Cork, Falmouth, Belfast and Glasgow, three times a week.*

The South Devon Railway is now open to Plymouth, the Station being adjoining our premises. For Catalogues, and further information, apply to

WILLIAM E. RENDLE and Co., Union-road, Plymouth.

FIRST ORDERS WILL HAVE THE PREFERENCE; AS THEY WILL BE EXECUTED IN STRICT ROTATION.

ESTABLISHED 1786.

Fine collection of Phloxes, by name ... per doz. 6*s.* to 24*s.*
Fuchsias, in fine show varieties, by name ,, 6*s.* to 24*s.*
Verbenas, in fine sorts, by name ... ... ,, 6*s.* to 30*s.*
Petunias, in fine sorts, by name ... ... ,, 6*s.* to 18*s.*

SPLENDID SEEDLING PETUNIAS. (Plants in May.)

BARNES's Amaranth, rosy crimson, large, round, and flat	3*s.*	6*d.*	each.
,, Beauty of Stow, rosy pink, with white centre, extra	5	0	,,
,, Delicata, peach, margined with pink...	5	0	,,
,, Lilacea, lilac, with blue throat & veins	3	6	,,
,, Madonna, peach, crimson throat & veins	5	0	,,
,, Tourist, crimson purple, clouded with white, of great substance	3	6	,,

Chrysanthemums, fine sorts, by name, 6*s.* to 18*s.* per dozen.
Antirrhinums, Ditto Ditto 6*s.* to 24*s.* ,,

*** General Descriptive Catalogues may be had on application.—Danecroft Nurseries, Stowmarket, Feb. 23.

TO GRAPE GROWERS.—THE BLACK BARBAROSSA.

JOHN BUTCHER has a limited stock of the above truly magnificent GRAPE, introduced by C. T. Ward, Esq., from the Continent, and now for the first time offered for sale. It has the following good properties: the Vine, a most luxuriant grower, a free bearer; bunches, large and finely shouldered; berries, large and globular; flavour, equal to the Hamburgh; will hang on the Vine for at least another month to come, without sinking in size of berry, or losing in flavour; as hardy as the Hamburgh. Mr. Bevington, gardener to Mark Philips, Esq., exhibited the above Grape at the Horticultural Rooms, Regent-street, London, January, 1849, for which a Certificate was granted; and again on the 19th of the present month, when a Banksian Medal was awarded it. Some idea may be formed of the magnificence of this Grape, by its being but the third year of the tree bearing fruit—21 bunches, averaging 4 lbs. per bunch, was the crop of 1849. To those families requiring late Grapes, it will prove a valuable acquisition. Good plants, from eyes, 21*s.* each, including package. —London Agent, Mr. FREDERICK WARNER, Seed Merchant, 28, Cornhill, London; and JOHN BUTCHER, Nurseryman, Stratford-on-Avon.

Also BUTCHER'S HYBRID BLACK SPINE CUCUMBER. Length, 18 to 30 inches. Exhibited at Regent's-park Royal Botanic exhibition, 1846, for which a Certificate was granted. Papers of Seeds, 2*s.* 6*d.* each.—Stratford-on-Avon, Feb. 23.

CEDRUS DEODARA OR HIMALAYA CEDAR.—The Subscribers beg to inform the admirers and planters of the above hardy Tree, that they have upwards of FIFTY THOUSAND, from one to five years old, in pots, grown from seed, constantly in the open ground, which they are now supplying on such terms as will induce their general introduction into all plantations, being of rapid growth, highly ornamental, and of great value as a Timber tree.

WM. MAULE and SONS, Stapleton-road Nurseries, Bristol.

RHODODENDRON PONTICUM FOR UNDER COVER, &c.

JOHN WATERER begs to state he has large quantities of the above, which is now universally acknowledged the best Evergreen for such purposes, being free from attacks of hares and rabbits. Strong plants, fit for immediate planting, 10*s.* 6*d.*, 15*s.*, to 21*s.* per 100.

Descriptive Catalogues of his well known collection of American Plants, &c., to be had on application.

American Nursery, Bagshot, Surrey.

TO PLANTERS.

W. DRUMMOND AND SONS, Stirling, have this season a large Stock of FOREST TREES, of fine quality, which they are offering at reduced prices. The Plants, from the free soil and exposure of their Nursery Grounds, are well rooted and hardy.

Priced Lists, including Shrubs and Fruit Trees, sent post free, on application.

N.B.—Priced Lists also of Seeds and Agricultural Implements sent free if required.—Stirling, Feb. 23.

EARLY TEN-WEEK POTATO, the earliest grown, will beat the Ash-leaved Kidneys by ten days—per bushel, 14*s.*; per peck, 4*s.*, bags included. Pure Stocks of ASH-LEAVED KIDNEYS, RED DITTO, BARHAM'S WALNUT-LEAVED, SHAWS, REGENTS, FORTY-FOLD, &c., at moderate prices.

Twelve of the newest and rarest Flower Seeds:

Nemophila maculata	Martynia angularis
Brachycoma, splendid hybrids	Portulaca Thorburnii (yellow)
Phlox Drummondii alba	,, alba striata
,, oculata	Podolepsis chrysanthemoides
,, Leopoldina	Schizanthus retusus alba
Martynia fragrans	Ipomœa Burridgii

One packet each 10*s.* 6*d.*

GERMAN STOCKS, from 2*s.* per collection.
,, ASTERS, from 3*s.* ,,
,, CARNATIONS, 2*s.* 6*d.* per 100.

DUNCAN HAINS, 109, St. Martin's-lane, Charing-cross, London.

BECK'S PELARGONIUMS, AND OTHER RAISERS' PRODUCTIONS.

The Selections advertised at Two Guineas are all sold.

Of the varieties 1847 and 1848, enumerated in E. BECK's Catalogue (to be had in exchange for one postage stamp) a good assortment remains. The varieties intended for sending out next autumn in the two guinea selection are now propagating, and will be ready in September, enabling purchasers to grow them on, and to make good plants for the following year.

N. B. The latter selection will be distinct and good.

Worton Cottage, Isleworth, Feb. 23.

RENDLE'S DESCRIPTIVE CATALOGUE OF AGRICULTURAL SEEDS IS JUST PUBLISHED, and can be had on application, GRATIS (for one penny stamp).

It contains a descriptive list of all the best Field TURNIPS, *with the lowest market prices, also a full descriptive price current of all the best sorts of* CARROTS, MANGOLD WURZEL, CLOVER, *&c., as well as all the best varieties of Permanent Pasture Grasses.*

The following is an extract from the Catalogue.

Rendle's Imperial Purple-top Swede Turnip	...	per lb.	0s. 8d.
Ditto ditto	...	per qt.	1 0
Skirving's Liverpool Swede ditto, per lb., 8d.		per qt.	1 0
Laing's Improved ditto ditto, per lb., 8d.		per qt.	1 0
Purple-top Scotch ditto ditto, per lb., 8d.		per qt.	1 0
White and Green Globe per lb., 6d.		per qt.	0 10
White Belgian Carrot	...	per lb.	0 10
Yellow Globe Mangold Wurzel ...	...	per lb.	0 8
True Italian Rye-grass		per bush.	7 0
Best English Red and White Clover		per lb., 5d. to	0 7
Large Cattle Parsnip		per lb., 1s. to	1 6

With every other kind of Agricultural Seeds at the lowest market prices. (See Catalogue.)

PERMANENT PASTURE GRASSES, sold in mixtures to suit various soils, at 30s. per acre, allowing two bushels of light seed and 12 lbs. of heavy seed to each acre.

BEST SIX PEAS, recommended by Dr. LINDLEY.—Prince Albert, Bishop's New Long-pod, Knight's Tall Marrow, Auvergne, Bedman's Imperial, Fairbeard's Champion of England.

One quart of each for 6s. 6d., or two quarts of each for 10s.

BEST FIVE BEANS.—Early Mazagan, Long-pod, Green Long-pod, Windsor and Green Windsor.

One quart of each for 2s. 6d., or two quarts of each for 4s.

ALL THE SELECT FLOWER AND KITCHEN GARDEN SEEDS recommended by the writer of the Calendar (See *Gardeners' Chronicle*, Feb. 9, page 86), can be obtained AT THE LOWEST PRICES.

Hairs' Dwarf Green Mammoth Peas, 5s. per quart.

ASPARAGUS, LARGE BATTERSEA GIANT, Strong roots, at 2s. 6d. per 100. *The best in cultivation.*

YORK REGENT POTATOES.—The best variety for general crop, 5s. per bushel of 56 lbs.

All orders above 2l. will be delivered free of carriage to any station on the Great Western, Bristol and Gloucester, Bristol and Exeter, or South Devon Railways; or to any town in Devon and Cornwall; or to Cork, Dublin, or Liverpool, by Steamers.

Railway and Steam communication to all parts of Great Britain and Ireland.

For Catalogues and further particulars apply to

WILLIAM E. RENDLE & CO., Union-road, Plymouth.
ESTABLISHED 1786.

H. LANE AND SON have great pleasure in recommending the following SEEDS, which may be had by unknown correspondents, by enclosing Postage stamps or Post-office order. Seymour's Celery and Fleming's Melons having been so successfully exhibited, require no comment.

CELERY—Seymour's White Champion ...	1s.	6d.	per packet.
,, ,, Superb White ...	0	6	,,
,, ,, Red Matchless ...	0	6	,,
,, ,, Golden Perfection ...	1	0	,,
MELONS—Fleming's, or Trentham Hybrid			
Persian	1	0	,,
,, ,, Genuine Sweet Ispahan	1	0	,,

Great Berkhampstead, Herts.

MYATT'S LINNÆUS RHUBARB.

J. MYATT AND SONS can confidently recommend this variety as the best in cultivation. The most satisfactory proof of this assertion is the fact that the Market Gardeners round London and Manchester have planted the Linnæus Rhubarb more extensively than any other variety. It is extraordinarily productive, and about a fortnight earlier than the Victoria; added to this, it is held in general esteem for preserving and all culinary purposes. One-year planted roots, 1s. 6d.; ditto, Mitchell's Royal Albert, 1s. 6d.; Victoria, 9d. The usual Trade allowance.—Post-office orders are requested to be made payable to JOSEPH MYATT, Manor Farm, Deptford.—Feb. 23.

The Gardeners' Chronicle.

AT the last meeting of the Horticultural Society a plant was produced which illustrates in so striking a manner the true meaning of HIGH CULTIVATION in gardening as to demand from us special notice.

The plant in question was the well known showy Dendrobe (*Dendrobium speciosum*), an Orchid whose low price enables most growers to possess it, and whose peculiarities of constitution generally defy all efforts at making it blossom; the few have succeeded, the many have failed, although among the latter are to be reckoned some of the best gardeners in the world. And it is not a little singular that the two who have managed it best have been country clergymen; the Rev. J. B. HUNTLEY was among the first to succeed with it, and the Rev. C. Fox CHAWNER, of Bletchingly, produced the specimen on which these remarks are founded. The plant in question was about 12 feet in circumference, reckoning from the ends of the flower racemes, of which it had 35, each averaging about 75 flowers, of the most delicate cream colour, veined with violet. Therefore, about 2625 of these flowers were expanded or ready to expand at the same time. It is impossible to do justice by words to the appearance of such a specimen, nor is it easy even to imagine the extent of its beauty. It might be said to be a fountain of flowers.

The history of so few successes and so many failures is instructive, and briefly told.

Many Dendrobes inhabit the hottest and dampest parts of Asia, where the season of rest is short, and the temperature while they are growing excessive. Hence we find the warmest part of the stove their habitation, and moss perpetually moist their favourite soil. The object of the cultivator is to imitate the jungles of the Malay Archipelago, where there is not more than two or three degrees of difference in the quarterly mean temperature of the year. At Singapore, for example, it appears that the mean temperature ranges near 80° all the year round, there not being a difference of more than 3¾° between the means of the hottest and coldest months: and at Buitenzorg, the Botanic Garden of Java, the difference is said not much to exceed 2½°. But the family of Dendrobes is a very large one, comprising members of most dissimilar habits and constitution, some Alpine species appearing upon the branches of Oaks and tree Rhododendrons in the Himalayas, and others inhabiting the arid forests of New South Wales. It is, therefore, evident that the cultivation suited for species from Singapore, would be inapplicable to those from Australia and Northern India. Attention to this circumstance is what has produced the failure of so many, and the success of so few in the management of the showy Dendrobe.

That plant is wild in New Holland, where it is said to occur as far south as Port Jackson, and also within the tropic. We have it from Port Bowen in latitude 22° 50′ S. The characteristic of this Australian climate is long dryness, moderate mean temperature, and excessive difference between the cold and warm periods. It appears from Sir THOMAS MITCHELL's observations, as quoted in the Journal of the Horticultural Society, that in latitude 29° S., which may be taken as a middle point for the range of this species, in the summer there is a difference of 41° between the day and night, and the lowness of the night temperature throughout the year must greatly depress the average of diurnal temperature. Where this great explorer found an epiphytal Orchid in flower (*Cymbidium canaliculatum*), the night temperature was as low as 33°, and that of the day not more than 86°. It is therefore evident that the constitution of plants, placed by Nature in such a climate, must be essentially different from that of species from the jungles of India.

The following memorandum, by the Rev. Mr. CHAWNER's gardener, brief as it is, explains distinctly the history of this noble specimen:

"The plant has been grown in an intermediate house, varying from 45° to 55°, for the last three or four years; during the summer the house is kept from 65° to 75°. Last May the plant was put in a cold pit and exposed to the sun, with very little water; in September it was put back into the intermediate house, and has since that time had plenty of water."

Nothing can better express the conditions which are most favourable to the health of this and all such plants. During the season of rest, the Dendrobe is stowed away in an unheated pit, where its surface is acted upon freely by air, and such sunlight as the season naturally affords; at this time it has little water. In the month of September, the beginning of its own natural spring, it is introduced to a better climate, where the heat is 20° or 30° higher; water is gradually supplied; as it fully renews its vegetation, it receives this kind of food in abundance. Then it is that the latent vigour acquired during its rest begins to manifest itself; the organisable matter which was formed during a period of dryness and sun-warmth is rapidly converted into new parts; blossoms appear in profusion, and, by the month of February, they gush forth in one vast floral stream.

In May the new growth is accomplished; all the parts are fully organised and charged with the rich fluid which is to furnish further blossoms after some months' digestion in dryness and lethargy, under the influence of sun and air. In May the plant is transferred to the place whence it was taken in the previous September, and there it remains till the September following.

This would be the history of all New Holland plants, and of half the other plants in gardens, if means existed for carrying out the practice. This *is* the history of the noble specimens of Azaleas, Cactuses, and other prodigies which grace the Exhibition tents of the Horticultural Society in the months of May and June. Moreover, the principle upon which Mr. CHAWNER's gardener proceeded is applicable, with some modifications, to almost every plant that is known to us. To the Orchids from the highlands of Mexico and Guatemala it is indispensable; it is applicable to those of Brazil, Continental India, and China; it is applicable alike to greenhouse plants and stove plants, to forced fruits, and those which naturally inhabit climates which render "forcing," strictly so called, the only method of cultivation that is applicable in a country like England.

The reason of this is, that all plants, like all animals, require a season of rest. They cannot remain healthy if their vital forces are continually excited. They grow by day and rest at night; they are exuberant in summer, and in winter they are torpid. To quote the words of the "Theory of Horticulture"—

"If we look over the different climates of the world, we shall find that in each there are a season of growth and a season in which vegetation is more or less suspended; and that these periodically alternate, with the same regularity as our summer and winter. I do not know that there is in nature any exception to this rule: for even in the Tierra templada of Mexico, where it is said that, at the height of 4000 to 5000 feet, there constantly reigns the genial climate of spring, which does not vary more than 8° or 9°, intense heat and excessive cold being alike unknown, and the mean temperature varying from 68° to 70°, we cannot suppose that, even in that favoured region, a season of repose is wanting; for it is difficult to conceive how plants can exist, any more than animals, in a state of incessant excitement. Indeed, it is pretty evident that these countries have a period when vegetation ceases; for Xalapa belongs to the Tierra templada, and we know that the Ipomœa purga, an inhabitant of its woods, dies down annually like our own Convolvuli. But, although all plants have naturally a season of repose, their winter is not in all cases cold. In the tropics it is marked by coolness and dryness, while the summer is rainy and very hot; and in extra-tropical countries the two seasons vary in their character, according to latitude and local circumstances."

This is one of the cardinal points in gardening: well understood now a-days by our great cultivators, but still unthought of by many from whom better things might be expected. Mr. Fox CHAWNER's Dendrobe will, we trust, remind them that by attending to it rationally a country parsonage may be made to produce specimens of excellence such as we seek in vain in some imperial gardens.

IT is not a little curious that, gardeners as we are, the true mode of making a GRAVEL WALK should still be a matter of dispute. One would have thought that so simple a question, and one upon which personal comfort so greatly depends, would have been disposed of conclusively long ago.

Opinions may be said to be divided among the three following plans. In No. 1 the walk is excavated to the depth of 9 inches or more, and then is filled up with a layer of rough materials at the bottom, covered with finer gravel, the convexity being below or just up to the level of the adjoining

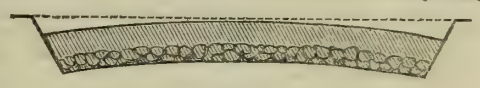

Fig. 1.

sides. In No. 2 the hollow for the walk is made to slope downwards from the sides to the centre, very coarse materials being employed at the lowest part, the convexity still being below or just up to the

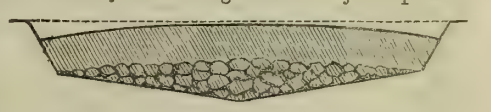

Fig. 2.

level of the adjoining sides. In No. 3 the walk is made upon the surface of the ground, the edges only being a little excavated, and the convexity is completely above the adjoining sides.

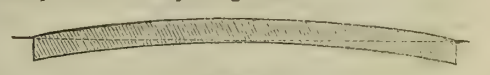

Fig. 3.

In all these methods the surface is hardened by a case of good binding gravel.

In Nos. 1 and 2 the rain which falls on the walk is detained by the sides, and sinks in; but it is supposed that the rough material carries it off as a drain —especially in No. 2. In No. 3 the rain which falls on the walk is immediately thrown off upon

the surrounding borders. The cost of materials is about twice as great in 1 as in 3, and about three times as much in 2 as in 3. The question is, which is the most efficient?

We should very much like to hear our correspondents' opinions on this subject, before we offer our own. For the present we shall only say that we know execrable walks made at great charge upon the plan of Nos. 1 and 2, and excellent walks made at small cost upon the plan of No. 3—the sides only being kept lower than in the figure, in which the dotted line represents the ground level.

Of course the question is, which is the best kind of walk in *wet weather?* In dry weather one kind of walk is as good as another, if the surface is but hard.

KIDNEY BEANS.

The varieties of these are very numerous. They may be distinguished into two classes by the colour of the Beans.

A. Beans *white.*

B. Beans *coloured.*

Class A. §. 1. Dwarf sorts.

1. *Early Dwarf Dutch*, aliàs Dwarf Dutch, Large White Dwarf Dutch, Dwarf White Dutch, White Long-pod Dutch, Early Dwarf White, Nain hâtif de Hollande, Nain de Hollande très hâtif. Pods long, narrow, excellent when green; Beans small, compressed. Suitable for forcing.

2. *Dwarf Canterbury*, aliàs Nain blanc sans parchemin. Pods narrow; Beans small, oblong, the plants branch much near the ground, bear abundantly and early. The *Dwarf Battersea*, aliàs Early Dwarf White, Earliest White Battersea, is scarcely different from the preceding; and the same may be said of the *Dwarf Sabre*, Sabre Nain, *Dwarf French White*, or Nain blanc très productif.

3. *Early Laon*, aliàs Early White, Dwarf White, Nain hâtif de Laon, ou Flageolet. Very dwarf, early, good for forcing, equally suited for eating green, and when the seeds are ripe.

Other varieties of less importance in this section are the *Nain de Bohemia à grosses cosses. Nain blanc d'Amerique, Large White*, aliàs Royal White, *Deux à la touffe*, and the *Soissons nain, ou gros-pied.*

§ 2. Runners.

Large Running White, aliàs Long White, White Long-pod, Large White Sugar, Tender-pod Bean Runner, De Soissons, Sabre à très grandes cosses. This is the common flat white Bean, generally cultivated for use in a dry state; but it acquires the finest flavour when grown at Soissons.

Sabre. Pods large, very long, excellent when young, even when nearly full-grown they are still tender and fleshy; and may be preserved for a length of time by being cut into pieces and salted; the Beans are excellent for use in a dry state.

Cranberry Runner. This is also used in a dry state.

Other sorts belonging to this section are the *Prédome*, aliàs Prudhomme, or Prodommet, *Sophie*, and the *Haricot Riz;* but they are unsuited to an English summer.

Class B.—Beans coloured.

§ 3. Dwarf Sorts.

Dwarf Speckled China, alias Dwarf China, Early China, Robin's Egg, Dwarf Robin's Egg, Early Dwarf Pink Spotted. An early sort, suitable for forcing. The *Haricot de la Chine* of the French, aliàs Polish Bean, is also dwarf and early, but it is sulphur-coloured, and not speckled with red.

4. *Wilmot's Forcing Cream Speckled.* Beans oblong, pale dun, speckled with dark chestnut; excellent for forcing.

5. *Dwarf Negro*, aliàs Early Negro, Early Black, Nain Noir, ou Nègre. Well known as one of the best for general cultivation; it is very productive, and the pods are very tender.

6. *Black Belgian*, or Haricot Noir de Belgique. An excellent sort, bearing considerable resemblance to the preceding, but differs in having darker green foliage, and it is dwarfer and earlier than the Dwarf Negro; very productive, and good for forcing.

7. *Fulmer's Early Dwarf*, aliàs Fulmer's New Dwarf, Fulmer's or Fulner's Dwarf Red, Early Dun, Dwarf Dun-coloured, Dwarf Forcing Dun-coloured, Early Frame, Earliest Forcing. Much esteemed for early crops, and forcing. Closely allied to the preceding is *Fulner's Speckled Dwarf*, aliàs Dwarf Red Speckled, Dwarf Light Red Speckled, Early Dwarf Forcing Speckled, Large Forcing Dark Red Speckled, Suisse rouge; and with Beans a shade darker, we have also very similar to the above the *Early Dwarf Purple Speckled*, aliàs Early Purple, Dwarf Purple Speckled, Dwarf Speckled; allowing for another shade darker, and we may include with these the *Dwarf Black Speckled*, aliàs Dwarf Black Mottled.

Other sorts belonging to this section are the *Jaune de Canada, Suisse gris, Suisse gris de Bagnolet, Ventre de biche, Dwarf Yellow*, aliàs Early Dwarf Yellow, Nain couleur d'Abricot, *Rouge d'Orléans, Nain du Canada rouge et jaspé, Suisse Nain rouge foncé.*

§ 4. Runners.

Prague or *Red Pea.* Pods tender, Beans round, when ripe rather thick-skinned, but mealy and well flavoured, similar to a Chestnut. Prague bicolor, Prague jaspé are varieties of the preceding. The Haricot d'Alger resembles the Prague. The green pods of the Prague Beans soon become unfit for use.

The *Lima*, the *Haricot du Cap*, or Venetian Sugar, and the *Sieva*, are all too tender for this climate. The preferable sorts amongst those above mentioned have numbers prefixed.

Scarlet Runner.—The Scarlet Runner and its varieties belong to a different species from that which has furnished the sorts of Kidney Beans above mentioned, and although usually considered an annual, it is, in fact, a perennial, having tuberous roots similar to those of the Dahlia, and like that may be preserved through the winter; when if planted out in April they soon make their appearance above ground, and produce an early and abundant crop. The principal sorts are the

8. *Scarlet Runner*, aliàs Tall Scarlet Runner, Haricot d'Espagne, ou écarlate. Flowers scarlet, Beans dark-red, pods rough on the outside, and therefore not so much esteemed as the Kidney Bean, although tender to eat; and the plants bear abundantly, even without stakes, if their tops are pinched off.

White Dutch Runner. Flowers and Beans white; does not continue so long in flower as the preceding.

Painted Lady, or Haricot d'Espagne à fleur bicolor. Flowers bright scarlet and pure white; is ornamental, but not so good, in an economical point of view, as the Scarlet Runner. *R. T.*

NOTES OF A TRAVELLER—No. IX.

The Enkianthus at Hong Kong.—The Enkianthus quinqueflorus is one of those few Chinese plants which will scarcely submit to cultivation, or perhaps it would be more correct to say that its proper management is not understood. A description of its habits, as observed on its native mountains in Hong Kong, will probably assist those who are trying to cultivate this beautiful plant in England. The island of Hong Kong has often been called a barren rock, an expression which, in our days at least, is not quite correct. When it was formed by some convulsion of Nature, in the earlier periods of the world's history, it was no doubt a barren chain of rocks of very irregular outline. Gradually, however, like those islands in the eastern seas which are every day forming by the agency of animals, a great portion of the surface of these rocks became partially covered with soil and vegetation, although many of their peaks are still uncovered, remaining as barren as they were when first formed, and bidding defiance to time and change.

On these mountains, from 1000 to 2000 feet above the level of the sea, the Enkianthus is found growing abundantly, and in great luxuriance. It is never seen in the valleys or low lands, unless when brought down by the natives. The soil is loamy, not unlike what we see at Shirley or Wimbledon, and mixed with stones and large pieces of granite which have become detached from the rocks. The plant delights in fixing itself in the crevices of the rock, and is often found in these situations with very little soil about its roots. About the end of April or beginning of May, at the change of the monsoon, the wet season begins. The Enkianthus then grows most luxuriantly, and all the leaves, buds, and shoots, are then fully formed. In the autumn, with the exception of a week or two in September, the weather is dry and very hot. At this period the branches and buds of the plants get perfectly ripened, many of the leaves fall off, and the plant having formed its secretions for the following year remains in a dormant condition during the winter, which, in Hong Kong, is cool and dry. In the hottest months in the year, namely, June, July, and August, the maximum temperature in the shade rarely exceeds 90° Fahr., but on a clear day one of my thermometers indicated 140° in the sun. In winter, although the north winds are cold and piercing, frost and snow are almost unknown in this part of China. When the first impulse is given to vegetation by spring the Enkianthus bursts into bloom, and the sides of the barren hills are seen gay with its flowers.

This is the way in which Nature treats this charming plant, and we must follow her example before we can hope to see it half so beautiful as it is on its native mountains. There are, however, two natural circumstances connected with success which are difficult if not impossible to imitate. The one is the bright sunshine which ripens the wood in autumn, and the other is the peculiar nature of the mountains on which the plant grows. In the hottest weather, even when no rain has fallen for months, and when the valleys are parched and burnt up for want of it, these mountain sides are always moist a few inches below the surface, and teem in all directions with cool and refreshing springs.

The Enkianthus is always in blossom at the time of the Chinese new year, when flowers are in great request for the decoration of the houses, boats, and temples. It is brought in large quantities from the hills, and sold in the streets, or sent about in presents, after the same fashion as the Holly and Mistletoe in England. If the branches are cut and placed in a jar in water, before the flowers are fully expanded, the latter will remain in perfection for a fortnight or three weeks. The pretty wax-looking globular flowers are very handsome, and are held in high esteem amongst the natives. *R. F.*

DISEASES OF PLANTS.

(*Continued from p.* 101.)

Genus XVI.; *one species.* (*Etiolement*) Blanching.—Some plants at the first period of their vegetation grow with great rapidity; their vigour is then checked, and they remain dwarf. Others in a short time attain a height quite disproportioned to their age, but are far from having the thickness or strength which they ought to have. Remaining thus slender, they shortly perish. This happens especially to those grown in close dark places, where they have been artificially forced by dung or other fermenting substances. This is the disease which the French call *Etiolement*, and which we Italians sometimes designate as a *smagrimento*, or more popularly as a *threading* of the plant, in allusion to the young shoots, which are slender enough to be compared to threads, as may often be observed in plants stowed in dark places for the winter.

The want of light, and often a superabundance of heat, may be considered as the causes of this disease, which must not be confounded with the weakness produced by the ill-judged pruning of young plants. It may generally be prevented, but when once developed it is difficult to arrest its evil consequences. It may be avoided by keeping the plants, as has been so repeatedly recommended, in places sufficiently lighted. Attention must also be paid in sowing seeds in hotbeds that the first fermentation of the manure be over.

To gardeners and amateurs, I would in these cases recommend that their seeds should be sown in pots or pans, so placed in a bed of earth covering the manure, that the young seedlings should enjoy a free circulation of air, with abundance of light and heat. And it will be a most useful practice to change daily, or at most every two or three days the position of those pots which require to be kept under cover or contain the most delicate seedlings. I have already alluded to the methods by which I have succeeded in saving so many. Moreover, that the cultivator may not be disappointed, he must attend to all the general directions for the sowing of seeds, and, above all, take care that the plants are all equally exposed to the rays of light.

Genus XVII.; Phytolithes, *or Vegetable Stones.*—This disease attacks the roots or fruits of some plants, which have in the inside of those organs bodies which in appearance, and especially in hardness, resemble little stones. I have thus established two species.

First species. Phytolithes of Roots.—The roots of the Potato are the most liable to this disease. The tubers attacked by it, when planted, throw out very small shoots, which grow exceedingly slowly, and their whole produce is most miserable. Inside they show black canker-like nodules, and become altogether harder and more filamentous than sound ones. The French call the disease *Poivre* or *Frisoleé.* It occurs also in other tuberous roots, and even, as I have reason to believe, in some roots not tuberous. These indurations appear to arise from too great a quantity of manure of a heating kind, as it is in very fertile soils much manured with stable dung that Potatoes are the most liable to them. Although the number of individual plants attacked be not numerous, the damage done on the whole is often considerable.

Second species. Phytolithes of Fruits.—There is no one who may not have met with the stony substances found in some fruits with fleshy pericarps; they are frequent in Pears, and occur almost always in Quinces. The works of Duhamel, so little known to cultivators, describe the anatomy of such fruits with great exactness, and are alone sufficient to give an idea of the elevated views of that celebrated man.

From the observation that Pears grown in fertile soils or on espaliers but very seldom show any signs of these indurations, which are abundant only in sterile situations, have convinced me that the disease is indeed among those arising from want of proper nutriment, or of the aid of the stimulants necessary to bring the fruit to perfection. I have read in a very respectable work that the great number of seeds which the Quince produces, and which are brought to perfection at the expense of the pulp, in our country where the fruit does not ripen perfectly, are the cause of these stones. But the celebrated Abbé Molini assures me that in Chili, his native country, there are two species of Quince which attain perfect maturity without any such stony concretions, from which I conclude that these are with us the result of our climate.

I do not enter into any details on the remedies for this disease, for if owing to climate there is of course no cure. Where the want or superabundance of manures are the cause, the cultivator will readily see how to prevent it. In the case of trees, measures must be taken whilst they are young. Transplantations, grafting, working about the roots, may induce them to bring their fruits to a better condition. It would be curious for those who have sufficient plant houses, to try whether the Quince may not be so cultivated as to ripen its fruit perfectly without these phytolithes.

CHEVREUL'S SCHEMES OF FLOWERS FOR JUNE, JULY, AND AUGUST.

June.—In this month we have Heartsease, white and yellow, that is to say of the same colours as Crocuses; the former may therefore be arranged similarly to the latter. A similar observation will apply to violet and white Rockets (Hesperis matronalis), and the double American Cress, or Barbarea, which is yellow. The following arrangements, too, will be found agreeable. 1, Flax, Golden Rod (Solidago multiflora), Flax, Golden Rod, &c. 2, Red Snapdragon (Antirrhinum majus), white Snapdragon, red Snapdragon, white Snapdragon, &c. 3, Siberian Larkspur and scarlet Lychnis alternately. 4, A row of red Foxglove and white Foxglove alternately.

July.—1, A row of red Malope (Malope trifida) and white Malope alternately. 2, Some plants of Zinnia violacea in the middle of a confused group of white and

red Malope look well. 3, The same is true of the blue Veronica (Veronica spicata), Fennel flower (Nigella damascæna), Siberian Larkspur, Coreopsis tinctoria, and Eschscholtzia californica. 4, Rows of China Asters, in the following orders, look well: 1, white, red, white, red, &c.; 2, white, blue, white, blue, &c.; 3, white, red, white, blue, white, red, white, blue, &c. 5, Borders of China Asters, sown thickly, produce a good effect. 6, Blue Canterbury Bells (Campanula medium) alternating with white of the same. 7, Flax, Eschscholtzia, Flax, Eschscholtzia, &c.

August.—1, Violet Phlox (Phlox decussata), white Phlox, violet Phlox, white Phlox, &c. 2, Violet Phlox and Golden Rod (Solidago humilis or integrifolia or recurvata), alternately. 3, Violet Phlox alternately with yellow Milfoil (Achillæa filipendula), or Eschscholtzia. 4, Siberian Aster, Rudbeckia speciosa, Siberian Aster, Rudbeckia, &c. 5, Siberian Aster, yellow Milfoil, Siberian Aster, yellow Milfoil, &c. 6, Convolvulus major purple, Eschscholtzia, Convolvulus, Eschscholtzia, &c.

A circular basket, in the middle of which is a tree, whose trunk is covered round with Colvolvulus major, and which is itself surrounded by Eschscholtzia, looks very well; so does a similar basket in which the Convolvulus is replaced by Nasturtiums and the Eschscholtzias by violet Heartsease. A border of dwarf Larkspurs, sown thickly, may be taken for this period of the year.

ON THE CONDITIONS ESSENTIAL TO THE MOST PERFECT CULTIVATION.—No. XII.

I hope that all who read these papers will have observed that while an external physiological character has been purposely avoided, their aim is to place the practice of gardening upon a scientific basis. My object for such a course is this: there are many excellent cultivators who, by the result of a long series of operations, are enabled to calculate with tolerable correctness upon the termination of their labours, and who from such conclusions are too prone to look upon scientific data as mere toys for the scientific, rather than as the alphabet of success in their own particular calling; forgetful or unwilling to acknowledge that the purposes of science are to teach by a short route the same lessons that mere practice imparts by a circuitous one. And it becomes difficult to convince them that the results of carefully digested and well understood facts, in the philosophy of vegetable life, and its relation to external circumstances; and the knowledge of cause and effect, as deduced from experience, are one and the same thing; always, awarding to scientific elucidations that superiority of being able readily to meet and to adapt a change of circumstances; and as it is much the better system to give a youth a tolerable idea of a language before we burden the mind with a host of dry grammatical technicalities, so in cases such as I have described it is preferable, and possibly the only means of success, to prove the truths of science by the light of practice, as a guide to further excellence, rather than to pursue an opposite mode of tactics.

Every gardener knows he cannot grow his plants in the dark, he is well aware that the results of such treatment would be elongation and etiolation in proportion as light is absent; yet how few of us calculate upon the value of the delicate and complicate apparatus—a leaf; how seldom do we adapt our artificial paraphernalia to meet its requirements, and to facilitate the healthy performance of its functions. Recollection recalls one or two instances of a lamentable deficiency in the knowledge of the office and nature of leaves. A governess, passing through a conservatory with her young charges, where a person was sponging the leaves of a Gardenia, and observing how bright their appearance while wet, very innocently asked if the leaves were being varnished. Here is a forcible instance of the great deficiency of a popular acquaintance with the leading facts in natural history. When will such be considered as a necessary appendage to an ordinary education? Another instance exhibits similar ignorance in a more lamentable degree, and in a case where one would least have thought of seeking it. A spruce young nurseryman, very busy in his own peculiar manners, replied to an interrogatory, as to why he was depriving a plant of many of its healthy leaves, that it had too much foliage. Now, as the plant was an Endogen, and the defoliated organs of a healthy green, I am at a loss to know upon what principle of physiology this operation was based. If I have exhibited an ignorance of some principle bearing upon such a practice, I shall be but too thankful to be set right.

It would appear upon a cursory review of solar and atmospheric influence in relation to the construction of our ordinary glass houses, that the admission of a constant supply of the latter is far from being necessary. Instances are on record where a supply of fresh air was apparently purposely excluded, and no bad results would appear to have followed. In the *Chronicle* for 1848, page 267, is a remarkable instance, to the comments upon which I beg to refer the reader; and I believe that Mr. Knight recorded similar cases. Now we know that the constitution of the atmosphere is such, that with all the appliances of science, and on a comparatively limited scale, it becomes next to impossible to produce a vacuum. Intruding itself into the most minute apertures, and mingling with and forming part of almost every ordinary substance we employ, we become forcibly reminded of its great importance in the economy of all beings endowed with organic or animal life.

It is no less necessary in the pulmonary circulation of the animal to free the system of its carbonaceous impurities than in the analogous functions of vegetable life, to enable the plant to form and fix the very bones and sinews of its system, and as a medium through which to rid itself of its superfluous moisture. The insinuating property of the atmosphere is perhaps one of the most beautiful adaptations in Nature. Its existence being only known to us by its effects, or through the result of experiment, and not rendering itself palpable to our grosser senses, we should often be led to exclude it where its presence is of vital importance; and, in many cases where we imagine we do exclude it, such is only apparent not real. And to refer to the cases of closed houses just cited, it is evident that a thousand apertures present themselves through which the atmosphere obtains an "exit and an entrance," carrying its vital influence where misguided intention would have excluded it. It is very questionable if plants more than animals could exist without a supply of fresh air. The "Wardian case" may seem to settle the point, but in a note to Dr. Carpenter's excellent and popularly written little work on Vegetable Physiology, he says, "The author has that gentleman's (Mr. Ward's) authority for saying, that the common notion that the external air should be completely excluded is quite an erroneous one." *G.*

VILLA AND SUBURBAN GARDENING.

Much attention has lately been paid to the subject of seed lists; and as I have had considerable experience in regard to seeds, I cannot perhaps render my amateur readers better service than to present them with such a list as may be suitable for their guidance, with some directions concerning the culture of the articles recommended.

Peas—Early Kent, 1st sowing
Scimetar, 2d do.
*Fairbeard's Champion
*Knight's Dwarf Marrow
*Bishop's New Longpod
* These will be found first-rate for summer crops

Beans—Mazagan, 1st sowing
Marshall's Prolific, 2d do.
Windsor, summer crop

Kidney Beans—†Dun
†Negro
†These are esteemed kinds, and abundant bearers.
Wilmot's Cream-speckled, best for forcing
Scarlet Runner

Beet—Barrett's Crimson

Broccoli—Grange's Early, 1st sowing, to come in during autumn
Walcheren, for autumn, winter, and spring, in mild seasons
Hammond's Cape, excellent at all seasons
Wilcove, for early spring use
Knight's Late Protecting
The value of Broccolis depends chiefly upon their being well saved

Brussels Sprouts—The tall kind grown by the London market gardeners is the most profitable. I have frequently found imported seeds to produce a dwarf variety

Cabbage—A well-saved York is a most valuable kind for all the purposes of the amateur. The variety under the name of Atkins's Matchless has proved generally good and true

Carrot—Early Horn, for first crop
Altringham, for winter use

Cauliflower—One variety is ample, if saved genuine

Celery—Seymour's White and Red are the best in cultivation

Cucumber—Victory of Bath

Endive — Green curled for autumn use
Batavian, for winter ditto

Lettuce—*White Cos
*Bath ditto
*Paris ditto
* These are good summer kinds
†Brown Dutch
†Hammersmith Hardy
†These stand the winter well

Melon—Beechwood

Onion—Portugal, for use before Christmas
Strasburgh, for use after Christmas
James's Keeping, for ditto
Silver-skinned, for pickling

Parsley—The quality of this depends exclusively upon how it is saved

Radish—Early Frame, 1st sowing
Scarlet Short-top, 2d do.
Red and white Turnip

Savoy—Green Curled

Spinach—Round, for summer
Prickly, for autumn sowing

Turnip—Early Dutch, 1st sowing
Early Stone, 2d do.
Yellow Garden, for winter use

The above list will serve to guide the amateur in his selection. All, however, depends upon how the various seeds have been saved. I apprehend that of late years a cheap article has been more aimed at than a genuine one. *Pharo.*

Home Correspondence.

Descent of the Sap.—You ask your correspondents to explain how it is that when a ring of bark is removed from a branch, the new growth takes place principally on the upper edge of the wood, and very slightly on the lower? Now, in this question it is assumed that in all cases the amount of matter formed at the upper edge of a wound in a branch is much greater than that at the lower, but, as I have before stated, the younger the branch is, and the fewer leaves there are above the wound than below it, the less disparity there will be between the quantities of matter thrown out by the upper and lower edges of the wound. The position also of the branch has an effect, as the disparity will be less in horizontal branches than in perpendicular ones. I speak here from only a limited number of experiments, and I wish some one would repeat these experiments on branches of all ages and in all positions, and let the results be known. Not admitting, then, the fact to be universal, I yet allow that in the great majority of cases there is (especially in ringed stems), a much greater accumulation of matter at the upper than at the lower lip of the wound, and you ask, if this does not depend on the descent of the sap, to what is it owing? If by "descent of the sap" is meant merely a passing out of organisable matter from the most dependent part of a wound, then I apprehend that no one will deny the fact; but if by "descent of sap," is meant an inference from such cases as this, that there is a general descent of the assimilable matters in the entire or unwounded plants, then I think this is unproved. As I before said, the entire want of evidence of the existence of a descending current in living entire plants, is one objection to the grand theory; and this one fact of the greater amount of wood formed in the upper lip of a ring can, I think, be fully explained by the effects of gravitation. When the bark of a tree is wounded, the continuity of the tissues by which the sap ascends is destroyed, and the physical law of gravitation operates, and a greater quantity than usual of assimilable matter is carried to the injured part, the consequence is, that cell growth goes on rapidly in proportion to the supply of the matter from which the cells are formed. This is my explanation of the phenomena in question. With regard to your second question, why "gum formed in the leaves of a Potato is afterwards found in the tubers in the final form of starch?" I certainly was not aware that such was the fact. If it can be proved in any way that the gum or dextrine found in the leaves of plants is really carried down to the stem or the tuber, as in the Potato, then a good case would be established for further inquiry into so curious a phenomenon. It certainly is not impossible to suppose that, to a limited extent, the soluble assimilable matters of plants may be carried from one cell to another within limited distances in all directions, but this is a very different movement of the fluids to that which is supposed to exist according to the theory of the descent of the sap. *E. Lankester.*——The sap descends freely, as it ascends; it will rise one day to the height of many feet, pass down the very next day by the same route, and yet ascend again to-morrow in another branch, provided it is compelled into these directions by artificial means, or by some derangement in the economy of the plant. Now, although this can be as clearly proved as the simplest axiom in Euclid, I dare say ninety-nine out of every hundred who think at all on the subject would call it rank heresy, or a thing impossible, contrary to all sound ideas and what not; but sound ideas and sound opinions are not what are required in these days; they have lost much of their former value in our estimation, since they have become articles of free-trade; facts, borne out to the evidence of our senses, we cannot resist; and by such facts, any one who is so minded, may prove to himself that the sap of plants descends in summer as surely as it rises in the spring, as you and many others know very well. But before I state how this experiment is easiest carried out, allow me to say what prompted me to try a question which amounted to self-evidence to my own mind for many years. Like other gardeners, I imbibed the doctrine of the circulation of the sap along with the rudiments of my garden education; but the first experiment in which I had a hand for a direct proof of the downward course of the sap was in the spring of 1827, just 23 years since. This experiment was at the instance of a worthy member of the Caledonian Horticultural Society, and was to be tried by Mr. Barnet, the Society's gardener at that time, in their Experimental Garden at Edinburgh; I was told at the time that the same experiment was recorded in some old author, but I either did not hear his name or I have forgotten it. I helped Mr. Barnet to plant three young Willow trees in a row, and about 2 or 3 feet apart, in the south-west corner of the Experimental Garden, and I well recollect that Mr. Barnet told me that these trees were intended for an experiment on the descent of the sap according to some author. The two outside trees, after a few years, were to be inarched into the centre one, and as high up as possible; the three trees were then to be allowed to grow until the two outside ones should become strong enough to enable them to hold up the centre one, which was then to be sawn off at the surface of the ground. I believe Mr. Barnet told me at the time that the trees mentioned by the old book were thus treated, and that the centre one remained alive—I forget how long—suspended between the other two, and thus the circulation, not up and down, but down and then upwards, must have gone on all this time. I never heard the issue of this experiment; indeed, I quite forgot all about it, until I read Mr. Caie's account of a nearly similar one on a Vine, page 103; but some of your correspondents at Edinburgh might inquire, and let us know about it. The next experiment on this subject in which I was engaged, brought out a new fact, besides proving the descent of the sap, which I never questioned; and this fact is, that the ascending current, without entering the leaves at all, will come back again under certain circumstances in the crude state, as we most erroneously call it when we mean to express a certain condition of it only. From this fact, which I shall presently show, I am led by analogy to infer confidently, that the rising sap is at the will of the leaves, if you allow the expression, and that, like the air, with respect to a vacuum, it can go about in any direction, up or down and sideways, wherever a vacuum in the cells offers a retreat, and when the leaves in the immediate neighbourhood, which caused such opening, are more powerful than their fellows to draw the current to themselves: but that part of the question is not of much practical value. What I had more immediately in view, when I tried this experiment, was to prove certain things which I did not then thoroughly understand, connected with a theory of pruning the Grape Vine, recorded in your pages by Mr. Fleming, of Trentham, for which he was smartly criticised by writers who did not throw any light on the subject, nor even appear to me to have comprehended it at all. I had too much faith in Mr. Fleming, to say nothing of the respect due to his authority, to mistrust what he said merely because I did not thoroughly understand the process by which he explained his views; and the following experiment was undertaken to arrive at the truth, if possible; and when the truth was revealed, I need hardly tell you how much I admired the sagacity of my esteemed friend in penetrating so far beyond his

brethren. A promising young shoot, from the bottom of an old Vine, in a late Vinery, was fixed on for the experiment; this was encouraged to grow on all the season, by keeping down all the laterals as they appeared. I know some will say that was not any encouragement, but the contrary; but let me have my own way so far this time. Before the end of the growing season, this shoot was nearly 16 feet long, not a bad growth, being only an extra shoot from an old plant in full bearing. After the fall of the leaf, I cut out all the buds on this shoot except the two at the very top; one bud would have been sufficient for my experiment, but I retained two, in case of accident. The wood was not nearly ripe at the top, but I wished to retain the greatest length of shoot. When these two buds started next season, their leaves had to draw up the sap through full 15 feet of naked young wood, and as soon as four leaves were expanded on each shoot I stopped both of them. The laterals made a vigorous effort to make up for this stoppage, but I cut them off also, and then I remained until the embryo buds were just bursting; by this time I knew the cells or tubes below them must be full of sap, in short, my bottle was nearly full; then I cut off all communication farther up by removing the two young shoots and a small portion of the older wood, to make sure that no more growth could be made there. You will perceive that I had thus provided a long piece of wood full of the ascending sap, or at any rate as full as our art could make it, and there was no possible outlet for it to escape in the upward direction; and now I thought to myself that as this sap did not reach the leaves to be elaborated, it must come back in nearly the same state as it ascended; that is, if it has the power to return at all. I left the whole for 24 hours, and next morning, as the clock struck seven, I cut off this bare shoot over the centre of the front path, and immediately a drop as clear as crystal fell from the upper part of the cut, and then drop, drop, drop, fell down in rapid succession, and I ran out to call two of the men to witness the curious experiment; but I had no occasion to hurry myself, for the wound kept dropping more or less until 11 A.M. The sap in this bare shoot must have been in active circulation downwards many hours before I cut it; as soon as the descending current reached the main stem of the plant, what became of it? It there met a much stronger current going in an opposite direction, and it must of necessity mix with it and turn up again; there is no other possible way of accounting for its final distribution. There are many other curious points that might have been ascertained if I had thought of them, but, as the experiment may easily be repeated next summer, I shall mention a few things which have since occurred to me, and no doubt some other things and modifications of the experiment will suggest themselves to those who will choose to put their heads a thinking on the subject. In the first place it would be interesting to know if gravitation played a part in the downward circulation, as seems very probable from the length of time the shoot kept bleeding after the supposed influence of the leaves in other parts of the tree were cut off. If I had reversed the ends of this shoot as soon as I saw the drops fall, and if the dropping then ceased at once, that would have established the fact of the current being in part at least owing to the law of gravitation. Again, suppose I had left one bud about the middle of the shoot, or nearer the bottom, and reduced the growth of this bud to one leaf on the day before I cut the shoot from the parent tree, would this one leaf balance the whole of the sap, or any part, or what? Indeed, the experiment might be tried under various modes to obtain more insight into difficult points, and even on points which we believe to be easily understood. When we hear some of our best gardeners say they encourage laterals on their Vines late in the autumn to help the formation of roots (!) surely we all of us want more insight into these things. In conclusion, pray urge your readers to repeat this experiment in various forms. It is not too late now to set about it, and a few months will suffice to prove it. Take any unpruned Vine against an open wall, disbud some of the longest of last year's shoots, except two or three at the top, and then repeat the rest of the experiment as stated above; the only precautions that I can now think of are, that the separation of the experimented shoots should take place out of doors after a few days of fine growing weather, and that the forenoon is better than early morning for cutting off such branches, as we know that a sudden chill during a cold night acts on the sap of the plants very powerfully. *D. Beaton.*

White Celery preferable to Red.—As articles named by the "Writer of the Calendar" are necessarily looked upon as coming from good authority, by those who are not so well versed in the theory and practice of gardening, considerable caution ought to be used in writing these notices. I supposed, as you have been sweeping the stray names from the antiquated lists of culinary seeds, the "Writer of the Calendar" would not be behind, and, consequently, I just looked among my old acquaintances to see who were gone and who were taking their places. I find white Celery clean gone, good, bad, and indifferent, and an excellent red sort mounted in its place. Now it so happens in real practice that red Celery, however large and fine, will not do the work of white; the one is rejected and the other must be had. I have served white Celery repeatedly where red was offered and rejected. Red Celery is hardier than white; it is also more rank in flavour and robust in habit. Delicate taste will try these qualities, especially where Celery is cooked as a dish. There is a sad mistaken notion in the growing of vegetables; for example, if Celery would not run, it never could be too large for a Lancashire grower; whereas Celery richly fed, quickly grown, blanched, &c., is infinitely more delicate than large old Celery, and white Celery is just as much preferable to red as Cauliflower is to Broccoli; and if you try purple Cape Broccoli you will find it but a sorry substitute for the snowy Cauliflower in summer. The same may be said of red for white Celery. *A. F.*

Food of Birds.—I am delighted to see such an authority as Mr. Doubleday speak in favour of birds. There are, however, two, condemned by "A. A." and his gardener, which he has omitted to defend—our noble songsters the thrush and blackbird. I will simply quote Yarrell's "British birds" on the feeding of these—1st, the thrush: "It feeds on insects, worms, and various species of garden snails, fruit, and in winter, various berries." 2d, the blackbird: "In the spring and early part of the summer, its food consists of the larvæ of insects, with worms and snails; as the season advances, they exhibit their great partiality for fruit of various sorts. When, however, the enormous number of insects, and their larvæ, with the abundance of slugs and snails, all injurious to vegetation, which are eaten by blackbirds throughout a great portion of the year, are duly considered, it may fairly be doubted whether the value of the fruit is not counterbalanced by services performed." And all this is independent of their noble song, which few can listen to but with delight. I could imagine some hedge popper from the town shooting them, but scarcely one who had any appreciation of the charms of the country. It is not for me to dictate or advise how gardeners should pass their time; but I am glad to say that mine is better employed than in prowling after birds, and picking up snails, which they would do for him if he would let them. I will just add, don't condemn a thrush whenever you see him near the Strawberries. If you will examine the fruit, you will see that the snail is oftener the offender, and the snail is his favourite morsel. *C. W.*

Pond Mud—Some months ago several notices appeared relating to pond mud, to which you assigned a much lower value as manure than it has hitherto held in public opinion; but, value or no value, it continues to accumulate, and the possessors of ornamental water have been wont to flatter themselves with the hope that the heavy expenses which they incur in cleansing it may be compensated by an increased return from their lands. This illusion you have done much to dispel, and I trust, therefore, you will permit me to inquire by what means this expensive work may be facilitated? how is it usually performed, and what improvements does the experience of any of your correspondents suggest? what estimate can be formed of the cost? and to what books can you refer me for information? The pond from which my mud was taken is about 300 yards long by 60 broad, situated in a flat meadow, and formed by damming up two small streams; the depth varies from 3 to 6 feet, with a clayey or gravelly bottom and a considerable quantity of black mud, which becomes brown on drying, when it forms a compact cake, which may be calcined into a light porous reddish brick, crumbling easily between the fingers. The gas emitted has a bad smell, but does not blacken whiteleaded paper. The water oozing from it is neutral to test paper, and gives indications of chloride of sodium and sulphate of lime. 1000 grains of the original mud lost by drying in the air 584 grains, and at the heat of boiling water an additional 37 grains. 1000 grains thus dried and powdered regained from the air, in 24 hours, 31 grains, while strong sulphuric acid gained 310 grains, their powers therefore being as 1 to 10.

Physical Texture.

	Grains.	Grains.
1. Flint stones	20	40
Pieces of wood	20	
2. Coarse sand, consisting of bits of quartz, with clay, which was either a cement to the quartz or mixed with the wood	2,113	2,480
Bits of wood, leaves, &c.	367	
3. Fine sand, the same as above, but rather more quartz	3,744	3,880
Decaying vegetable matter	136	
4. Impalpable matter, consisting of silica, and a most obstinate compound of silica and alumina	2,527	3,505
Organic matter	978	
Loss		95
		10,000

Chemical Composition.

	Grains.
Organic	870
Sulphate of lime	20
Carbonate of lime, little if any.	
Magnesia	4
Phosphates, about	50
Oxide of iron	120
Alumina	230
Quartz and fine clay	8,706
	10,000

The quantity of organic matter does not correspond with the sums of the first analysis, but it is difficult to ascertain it accurately in a soil so retentive of water. The iron appears to be retained as black oxide by the decaying organic matter, in which state it is allowed to be very injurious to vegetation. Now, do you consider that such a soil would have any value as a manure, either upon stiff clays or poor sands, both of which are within half a mile? and if so, how may its virtues be best exhibited? *Ruris Amator.*

A New Breed of Cockroaches. — On examining some of the Orchids the other day, William Johns discovered a colony of a species of cockroach very different from the common one; and as the same may probably be interesting to some of your entomological friends, I thought I could not do better than forward them. They are very nimble, and do a deal of mischief, living principally on the young roots, as well as on the old ones, when the plants are in a state of rest. The way in which they creep out of their shell is very remarkable. A short time before undergoing the change, a clammy substance seems to be emitted, by which the posterior part becomes attached. The insect then struggles to get free, and gradually works its way out, leaving its great-coat behind it. I was an eye-witness of one of these transformations, of which you will find the shells in a separate paper, and which will show the appearance of this variety of cockroach, without opening the box which contains the living specimens.—*W. B. Booth, Carclew.* [The specimens of a species of Blatta accompanying this communication are scarcely more than one-third of the size of the common Blatta of our houses, and rather broader in proportion. Some possess the rudimental wing scales, and all the specimens appear to be females. We shall be glad of any winged males if they make their appearance, for, until we see these (or are satisfied that the species never acquires wings), it will not be possible to determine the species. We should also be glad to learn from what country the plants attacked by them have been received. *J. O. W.*]

Origin of Hamburgh Grapes. — Seeing that the Hamburgh Grape has been recently the subject of speculation as to the derivation of its name, let me add my supposition that it may come from Alhambra—this species of Grape being abundant in the vicinity of that celebrated place. *Exeter, Feb.* 18.

On Plants adapted to Smoky and Confined Situations.—Referring to the questions and statements of "Leodiensis," at page 822 of your last year's volume, I beg to say that if the situation in which he has placed his Coniferæ is such that a current of wind is conducted and discharged on them, from the position of the adjoining buildings, he very likely is correct in his conjecture, namely, that the exposure to winds is as much the cause of failure as the density of the smoke; but I am aware that many of the Pine tribe, particularly the commoner sorts, are admirably adapted for rough situations, and far more likely to suffer from the effects of smoke and confinement, than from exposure. I had a hope that some correspondent would have answered "Leodiensis's" enquiries respecting plants suitable for smoky situations. I am particularly anxious to get information on this point. I should like to see a list of the evergreens and deciduous plants best adapted to stand the influence of smoke, accompanied with confinement, or the want of air. I entertain an idea respecting evergreens, that the thicker their leaves are, and the finer their polish, the better they are suited to resist the effects of smoke, and that all the Evergreen Oaks, Hollies (particularly the Laurel-leaved), Yew-tree, Spurge Laurel (Daphne), Portugal and common Laurel, Box, Aucuba, &c., are adapted for such situations. I know the Yew stands confinement as well as any plant, but I am not sure how it may get on when it becomes encased in soot. Does "Leodiensis" really mean to say that he has found the Camellia to be as hardy as the common Laurel? If so, what a splendid screen fence it must make! The formation of it, however, requires the exercise of a strong faith. *A Countryman.*

Classification of Roses.—It has been proposed, if I recollect rightly, to place all Roses in two grand classes—summer varieties and autumnals; but I fear that, if this plan was adopted, much confusion would ensue. I would not jumble together distinct and well-recognised groups, but I am of opinion that many that now exist might be united with advantage. Hybrid Provins, which are hybrids between the Provins and French, I would do away with altogether, placing the varieties nearly related to the Provins with them; the others with the French. Hybrid Chinas and Hybrid Bourbons are too much alike to be kept distinct, and might be put together. Instead of dividing Hybrid Perpetuals into three or four groups, it would be better to catalogue the habit of each variety; indeed, this should be done in all the classes, for without some such guide it is almost impossible to plant with propriety. I would put Damask Perpetuals with Hybrid Perpetuals, so few of the former being now worth growing; but I would keep Perpetual Moss Roses distinct; for we may yet expect some new and important additions to this class. With these alterations, the summer Roses would occupy six classes: 1, Provins and Hybrids; 2, Mosses; 3, French and Hybrids, 4, Alba; 5, Damask; 6, Chinese and Bourbon Hybrids; and the Autumnals would also occupy six, viz., 1, Hybrid Perpetuals; 2, Perpetual Mosses; 3, Bourbons; 4, Chinas; 5, Tea-scented Chinas; 6, Noisette. There would still remain the Climbing Roses, the Sweet and Austrian Briars, and perhaps a few others, which might be put in a miscellaneous class, and the purposes for which they are adapted stated. In addition to the above, the number of Roses catalogued should be very much reduced; the best sorts in each class should only be retained. *T. Allestree.*

Does the Leakage of Gas injure Timber-trees?—Such of your readers as have entered Southampton by the old London road, cannot have failed to admire the fine avenue of Elms at the entrance of the town, and must be sorry to hear that the trees on the south side of it are one after the other dying, and that unless the decay can be stopped, it is evident that in a few years all will be dead. By some persons it was supposed that the

injury done to the roots in laying a gas main along them a few years ago is the cause of this decay; and I have lately heard that the laying of a main along a line of trees at Blackheath was followed by their decay, and that a similar case has occurred at Paris. In both these places it was considered that the injury was caused by the leakage of gas, and the mains were accordingly removed, but with what success I do not know. It is stated that the leakage of gas amounts on an average to 20 per cent. of the whole quantity passing through the pipes. As this is a subject of much interest to the inhabitants of Southampton, and as no one has suspected the gas to be the cause of decay there, perhaps some of your correspondents would inform us whether such leakage is likely to injure the roots, and whether they have heard of similar cases. *Hantoniensis.*

Manuring Vines.—The following extract may be instructive to horticulturists. The experiment seems worth trying. "Nothing more," says a Vine grower on the banks of the Rhine, "is necessary for the manure of a vineyard, than the branches which are cut from the Vines themselves. My vineyard has been manured in this way for eight years, without receiving any other kind of manure; and yet more beautiful and richly laden Vines could scarcely be pointed out. I formerly followed the plan usually practised in this neighbourhood; and was obliged, in consequence, to purchase manure to a large amount. This is now entirely saved, and my land is in excellent condition. When I see the fatiguing labour used in the manuring of vineyards—horses and men toiling up the mountains with unnecessary materials—I feel inclined to say to all, come to my vineyard, and see how a bountiful Creator has provided that Vines should manure themselves, like the trees in a forest, and even better than they. The foliage falls from the trees in a forest, only when the leaves are withered, and they lie for years before they decay, but the branches are pruned from the Vine about the end of July or the beginning of August, while still fresh and moist. If they are then cut into small pieces, and mixed with the earth, they undergo putrefaction so completely, that, as I have learned from experience, at the end of four weeks, not a trace can be found." I could also give the evidence of a poorer Vine grower, but probably one is enough for your readers. *Falcon.*

The Winter at St. Petersburgh.—Our winter is exceedingly severe; we used to have every winter some mild days common to litoral climates; nothing of this kind happened since the beginning of the frost, and the mercury having been at—30° Fahr. (—27° to 28° Reau.), at several periods, is at this moment at —33° Fahr. Nevertheless, our great Palm-house (66½ feet high, 266 feet long, and 50 feet wide), keeps well an average temperature of + 59° to 60° when there is no sunshine, heated by hot water and steam. *F. E. L. Fischer, Imp. Bot. Garden, Jan.* 23 (*Feb.* 4), 1850.

Societies.

Horticultural, *Feb.* 19.—E. Brande, Esq., in the chair. Many beautiful plants were brought together on this occasion, but by far the most striking was a magnificent specimen of Dendrobium speciosum, from Mr. Duncan, gr. to the Rev. C. Fox Chawner, of Bletchingley. Further particulars concerning this will be found in a Leading Article. A large silver medal was awarded it.—Mr. Dobson, gr. to Mr. Beck, contributed a beautiful collection of Orchids, consisting of Cyrtochilum maculatum, four finely-blossomed Oncidiums, Cœlogyne flaccida, and the interesting fringe-lipped C. cristata. A Knightian Medal was awarded for these.—Messrs. Veitch had a small imported plant of the variety of Dendrobium aureum, called heterocarpum, from Moulmein, a cream-coloured kind, with a buff lip, and very sweet scented. Mr. White, gardener to A. Kenrick, Esq., of West Bromwich, produced an imported example of the beautiful Bornean Calanthe vestita, and with it a cut specimen of the tropical American Burlingtonia rigida. From Mr. Turner, of Slough, came a nicely bloomed plant of the purple-flowered Primula altaica, a species from the Asiatic side of the Bosphorus, in the way of our common Primrose. It is quite hardy, but on account of its flowering through the winter and early spring, plants of it potted and placed in the greenhouse serve to enliven it at a time when every fugitive blossom is an acquisition. Mr. Ingram, of the Royal Gardens, Frogmore, sent a specimen of Ceanothus dentatus, a dark blue Californian species, which is expected to be hardy. It was not sufficiently in bloom to show what its real merits may be; but its colour is good, and judging from the profusion of flower buds on the plant, it promises to become valuable in ornamental gardening. A purple-flowered Azalea, called Howardii, was exhibited by Mr. Frost, of Dropmore; and from Mr. Henderson, of St. John's-wood, came the unmanageable violet-purple Mirbelia floribunda, useful on account of its blooming in early spring; two Begonias, and Pimelea Verschaffeltiana, a glaucous-leaved unattractive sort, something in the way of P. spectabilis. In addition to his collection of Orchids, Mr. Beck exhibited a group of well-cultivated and nicely bloomed Cinerarias, for which a certificate of merit was awarded. They consisted of Cerito (one of the best of Cinerarias), Nymph, Maid of Artois, Bessy, Gem, and Adela Villiers.

Of Grapes Mr. Bevington gr. to Mark Philips, Esq., sent a bunch of Black Barbarossa, weighing 4 lbs. 13 oz. This is a Grape which was imported a few years ago from the continent by Mr. Philips, and about which very little is known. It grows to a large size, and is an excellent winter and early spring variety, keeping firm and good after other sorts are done. A Banksian Medal was awarded it. Two bunches, somewhat shrivelled, of a dark-coloured seedling, ripe in June, and stated to keep till now, were exhibited by J. B.; and Mr. Dunsford, of Chingford-green, sent a punnet of Black Hamburghs, which were reported to have been ripened on plants in pots.

Mr. Ingram produced a bundle containing 100 shoots of Asparagus, weighing 13 lbs. It was raised in low pits, heated with hot water, as described and figured at page 836 of our volume for 1847.

Mr. Kestell, of Dropmore, showed variously painted specimens of garden labels, some made of cast iron and others of zinc. They had oval heads with the front cast hollow, in which the name was painted, and then glazed over; but as the glass, lying hollow, is liable to be broken, and will permit water to condense beneath it, Mr. Kestell has tried another plan with these labels, which is, to imbed the glass in an elastic cement, which not only prevents it from being easily broken, but also preserves the letters better from external influences. Mr. Frost, gr. to Lady Grenville, stated that he had used these labels in the open air for three years, and had found them efficient. Mr. Morrell again exhibited some of his zinc-backed labels, whose cheapness and ready use render them convenient for many purposes.

From the garden of the Society came various plants, consisting of seven kinds of Orchids, among which was the seldom seen Spiranthes cerina, six varieties of Epacris, Porphyrocoma lanceolata, Franciscea latifolia, three Acacias, the tree Sempervivum, two Camellias, three Cinerarias, the pretty little Portuguese Violet Grass, described and figured at p. 239, vol. 1848, cut flowers of Chimonanthus fragrans and its larger flowered variety.

Linnean, *Feb.* 19.—W. Yarrell, Esq., V.P., in the chair. The Rev. J. Bedingfield was a elected a Fellow. Casts of the busts of the late Bishop of Norwich and the late Dr. Maton, formerly president and vice-president of the Society, were presented by the President. A series of portraits was presented by G. Ransome, Esq., of Ipswich. A packet of dried plants, collected by J. Ker, Esq., on the Mackintyre River, New South Wales, was presented by Mr. Pamplin. Flowering specimens of Canna latifolia, Begonia manicata, and Bilbergia iridifolia were exhibited by the Rev. J. Yates. A memoir of Dr. Schreber, who died in 1810, and was Professor of Botany and many other subjects in the University of Erlangen, was read by Dr. Wallich. Schreber was a pupil of Linnæus, and published an edition of the genera Plantarum and a natural history of quadrupeds. The author was indebted for the materials of his memoir, which contained many amusing recollections of Schreber, to an autobiography of Dr. Martius, who was his pupil, and the father of the great historian of the Palms. The secretary read two original letters of Sir J. E. Smith, to Dr. Dryander, one relating the discovery of galvanic action, by Galvani, and the other describing the procuring a charter for the Linnean Society. Specimens of Maize from the tomb of a Peruvian mummy were exhibited.

Botanical, of London, *Feb.* 1.—A. Henfrey, Esq., V.P., in the chair. The secretary read a letter from the President, nominating the Chairman Vice-President in the room of the late E. Doubleday, Esq. Several donations were announced. The continuation of Mr. W. H. Coleman's Paper "On the Plants indigenous to the neighbourhood of Horsham, Sussex," was read.

Miscellaneous.

Death of Mr. Smith, of Hopetoun.—We regret to announce that this well known Scottish horticulturist died at Hopetoun gardens on the 10th inst. He commenced his professional life at Ormiston Hall in 1790. He was afterwards promoted to the charge of the gardens there, and 1816 was removed to the more extensive sphere at Hopetoun House. With the exception of a few months, he was all his life in the employment of the noble family of Hopetoun. Mr. Smith was in many respects a self-educated man, and like most others of that class, he continued his pursuit of knowledge till late in life. He was a fair botanist, and had a general knowledge of plants both native and exotic. He was extremely fond of calculation, and even when far advanced in years, he added to his previous acquirements a knowledge of some of the higher branches of theoretical mathematics. He was an intelligent and zealous elder of the church of Scotland. Gifted with remarkable cheerfulness, and kindliness of disposition, he was greatly beloved by all his friends, and especially by the numerous young men who were trained under his care, and whose improvement and advancement in life he took pleaure in promoting. He was well acquainted with all the branches of his profession, and entered into all the modern improvements with interest, but his favourite line was the culture of hardy fruits, particularly Pears, of which he had formed a considerable collection. He became a member of the Caledonian Horticultural Society in 1809—the year of its formation; and he was one of the first professional men in Scotland, that were admitted Fellows of the Horticultural Society of London. He was a frequent contributor to the memoirs of the Northern Society; and several of his papers were inserted in the London Transactions. Retaining his active habits to the last, he was engaged in business within a few hours of his unexpected death. It may be added, as a very unusual occurrence, that his father-in-law, whom he succeeded at Ormiston Hall, and himself, made up continuously a period of service, wanting, it is believed, only a few months of a century.

Sale of Conifers.—A collection was sold by Mr. Stevens on Thursday last. It consisted for the most part of Deodars; Araucaria imbricata, varying from 1 foot to 18 inches high; a few examples of Taxodium sempervirens 6 and 8 feet high; T. pinnatum, 18 inches high; Pinus patula, Cupressus torulosa, and six plants of what were called "Gordon Island Cypresses." There were in all about 173 lots of 6 and 12 plants each (except the large Taxodium sempervirens which were sold as single specimens), and they fetched from 6*s.* to 12*s.* per lot.

Calendar of Operations.

(For the ensuing week.)

GENERAL REMARKS.

The correct labelling of the plants, otherwise carefully attended to, is a matter so generally neglected in gardens, that a few remarks on the subject may be of service. During rough weather, some of the hands may be usefully employed in preparing and writing labels. A beautiful display of flowering plants, tastefully arranged, is very gratifying; but, if we wish to give continued pleasure, to those who examine them more than once, it is necessary that nothing be left undone which can contribute to render them more interesting. Extra exertion of this kind is rendered more necessary by the spirit of intelligence which is so rapidly extending itself among all classes, who not only more fully appreciate the externally beautiful, but also seek gratification in entertainments of a mental kind. Gardeners therefore will, in general, find it to their advantage to meet as much as possible the wants of the day; one of which is obviously the neat and correct labelling of all their plants; and, as an additional motive, they will at the same time add to their own convenience. The object however will not be attained by merely affixing botanical names to them. To general observers—the English name, the native country, and year of introduction will also be interesting, and should be added, as well as the natural Order, accompanied by its anglicised form.

PLANT DEPARTMENT.

Plants which are beginning to grow should be critically examined at least once a week, and guided therein by frequently turning them round, judiciously stopping any shoots which are unduly taking the lead, and occasionally tying any that require it. A careful man, who takes a proper interest in his work, will notice these little matters when he is removing dead or decaying leaves or flowers; which, as well as sweeping up all litter, he will do before he commences watering. Another portion of the stock of Gesneras and Gloxinias should now be placed in heat, and the former lot of Achimenes will be ready for potting off. Let them be put at once into the size of pot in which they are to flower, as no plants suffer so much from the checks and sudden starts produced by being frequently repotted. If they are treated as recommended, the size of the plants will be proportionate to that of the pots; and when these are filled with roots, the plants will naturally arrive at a flowering state. The opposite method of frequently repotting these plants, causes the embryo flower-buds to be metamorphosed into small scaly bulbs. They are most useful for decorative purposes, when grown in a brisk bottom-heat, with a liberal supply of top-heat, and a free admission of air; as they make sturdier, better-shaped plants than when grown in a close temperature; besides which, they are better enabled to endure the cold currents of air in the conservatory and other places where they are generally placed when in flower.

FORCING DEPARTMENT.

In making new Vine borders, pay particular attention to forming a good sound bottom, and making provision for thorough drainage. The soil should consist principally of warm sandy loam; the Vine makes fibres much more freely in such soil than in that of a stiffer or more unctuous quality; and in the latter the roots go through the border almost without a single ramification. The admixture of manure is all very well, but is of less importance, as any quantity of richness can be added by means of top-dressings and liquid manure; the great desideratum being to form a warm porous border, which may serve as a medium by which suitable nutriment may be offered to the roots. If the loam is light and open in texture, some sheep, deer, or cow-dung, may be incorporated with it; and bone-dust is a suitable manure for soil of that description, and excellently adapted for the Vine, but should never be used with that which is already stiff and cold. Old lime rubbish and brick chippings are suitable materials for rendering the soil of Vine borders more porous. Look closely after Vines and Peaches, to see that the foliage is not being injured or destroyed; that of the former is liable to be attacked by a small beetle, which must be carefully sought for at night, as it commits its depredations at that time. Care must also be taken to prevent thrips establishing themselves, by fumigating with tobacco as soon as they are observed. The Peaches and Strawberries are very liable to be attacked by the green fly, and the same method will be found the most convenient for destroying this pest also. If any pot plants are growing in the forcing-houses, watch them closely.

In nine cases out of ten they bring mischief along with them. It is very necessary to nip all these plagues in the bud, before the infection has spread to any considerable extent, as by so doing much labour is saved, and the disappointment consequent upon the unchecked ravages of insects. Thinning the early forced Grapes will now require regular attention; it should be commenced as soon as they are fairly set, by judiciously removing all the berries that can with certainty be spared, and those that are left for future consideration should stand in such order that the removal of a berry at any time shall relieve the surrounding ones without disfiguring the bunch. The final regulation of the bunch need not take place till the berries are more than half swelled, but no sound reason exists why the first thinning should be postponed, as is frequently the case, until the berries have attained the size of large Peas, sharing in the nourishment which ought to have been directed solely to the berries which are to remain. The operation should be performed with a pair of clean, sharp, long-pointed scissors, and the whole of the footstalks should be removed along with the berry, but without damaging the footstalks of the other berries, and taking care not to touch any of the latter with the hand, as the tender skin of the young berries is liable to grow rusty where it has been rubbed.

FLOWER GARDEN AND SHRUBBERIES.

Propagating of half-hardy plants and shrubs should now be going on with activity. We have long since discontinued the use of pots in propagating plants for bedding purposes. We prepare our beds by filling up, to within a few inches of where the surface of the soil ought to be, with leaves and hot dung, which have been previously well fermented. The surface of the fermenting material should consist of leaves alone, as they are less liable to give off noxious exhalations; and, as an additional precaution, an inch of sand or coal-ashes may be laid over them. On this we lay 3 inches of light soil, and upon it 1 inch of sand, into which the cuttings are inserted. To assist in sustaining a strong bottom heat, we have a hot-water pipe passing beneath the bed, which we turn on when there are any symptoms of decline. The cuttings strike in this way very quickly; and, after being fairly rooted, they are taken up with balls of earth, and transplanted into cooler quarters. In this manner we save much time, as the labour attending the draining and filling of pots is all avoided. Instead of the old customary method of potting off the young stuff intended for masses in the summer, it will be found more economical to plant it out in prepared frames of suitable soil, consisting of one-third loam, one-third decomposed leaf-mould, and one-third sand, with a good drainage. The soil should not be more than 4 or 5 inches deep, and may rest on a bed of coal-ashes. The young plants should be set in rows from 4 to 6 inches apart, according to the habit of the plant and the length of time which will intervene before they are planted out. By passing a knife or sharp trowel down into the soil, between and across the rows, once or twice during this period, their roots will be prevented from intruding upon each other, and when required for planting out they will lift with nice balls of fibrous roots. Their tops also must be kept within bounds by timely and periodical stopping. It is true that one of these plants will occupy more space under glass than two thumb-pots; but it is no less certain that when turning-out season arrives, one of the plants grown as recommended will be worth half a dozen of the miserable things which have been starved in pots; besides which, the labour of watering is materially lessened—an important matter during the busy spring months. All kinds of plants intended for flower-garden masses come earlier into flower, and make greater progress, if treated on this plan, than when turned out of pots in which they have been growing any length of time. We recommend particular attention to this, as we have practised it extensively for some years, and have found it to answer extremely well.

FLORISTS' FLOWERS.

Ranunculuses should now be planted. It is not a good plan to dig the bed previously to doing so; but if unavoidable it should be well trampled, so that it may be solid for the fibres to strike into. A very old and successful exhibitor of these flowers always had a succession bed; this was the small offsets, and did one, more luxuriant than the rest, show a bloom, it was pulled off as soon as perceptible. Those roots which had not been exhausted were reserved for the best bed the succeeding year, and a mass of flowers was the consequence. We generally plant ours 4 inches asunder each way, burying them from 1½ to 2 inches. Seed should also now be sown in shallow pans, well drained. Polyanthus seed may also be got in. Pansies should be top-dressed with very rich compost. Seedlings will soon begin to bloom; if there is any symptom of excellence, pull off the early blooms, which only weaken the plant, without much chance (if unprotected) of withstanding March frosts and winds. Attend to Dahlias, Auriculas, Tulips, and Carnations, as previously advised.

HARDY FRUIT GARDEN.

To guard against the effects of late spring frosts, we again urge the necessity of affording artificial protection to the blossoms of our choice fruit trees, not on the walls only, but on those in the open ground also. This will be particularly required in damp low situations, where the slightest frosts do considerable damage. As a matter of course gardeners will make use of canvass and netting as far as it will go; but, as few have sufficient of this to protect all their trees, they will find the fan-shaped branches of Spruce or Yew a tolerable substitute. By applying these covering materials early in the season, the slight shade they afford prevents the untimely excitement which is the result of unseasonably warm weather during spring. The moderate sized espalier and pyramidal Pear trees, which have a sufficient quantity of flower-buds to make it worth the trouble, may be protected by rearing a few small poles over them, tent fashion, and thinly covering them with branches of evergreens; so disposed, they form an excellent shelter. Our success last year in protecting pyramidal Pears, and other fruit trees on trellises, induces us to press the necessity of protecting as many of these tender kinds of fruit trees as possible.

KITCHEN GARDEN.

As soon as the ground is sufficiently dry to allow of the surface being pulverised, the main crop of Onions should be sown. The piece of ground selected for this crop should be well drained, and sufficiently rich to prevent the bulbs being too small or strong flavoured; but at the same time, the opposite extreme must be avoided, or the produce will be watery, thick-necked, and less likely to keep well during winter. Early sowing of this vegetable is essential, in order to get the bulbs matured and housed before the short, sunless days of October. A secondary crop of Carrots may now be sown, but generally the main crop suffers less from the maggots when sown in April, or even in May, than those which are sown earlier; and although the roots of late sown ones are somewhat smaller, their good quality generally makes them more profitable. An early crop of stone Turnips should now be sown, and Asparagus seeds on the beds formerly prepared. Regular sowings of spring salads should be made in frames and warm borders. In planting out Cabbages, if you have more than enough for the regular crops, the rows may be planted only half the usual distance asunder, and the alternate rows drawn and used as Coleworts when about half grown. A sowing of one of the larger Cabbages should now be made in a frame, and also some Cauliflowers for the earliest spring sown crop, with some more under a warm wall to succeed them. A sowing of Celery should also be made on a moderate hot-bed; it should be sown very thinly, that the plants may not require pricking out so soon, and that when pricking out is necessary they may be moved with more soil to their roots. It is especially necessary to grow the earliest crop with as few checks as possible, to prevent its running to seed. A successional sowing of round Spinach should be made this week. Garlics and Shallots should now be planted on dry ground, if it were not done in November as recommended; they should be planted 6 in. asunder, on the surface of the soil, with merely sufficient fastening to keep the bulbs steady. Autumn-sown Tripoli Onions should now be transplanted, 6 inches apart, in rich soil, for Midsummer use; they should be secured in their places by closing the soil about the roots, not about the bulbs, the bases of which should always rest on the surface of the soil. The small button Onions which were sown very thickly in autumn, should also be transplanted in the same manner; if the ground is good, without being over rich, these will make fine specimens by autumn.

State of the Weather near London, for the week ending Feb. 21, 1850, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 25th 1846—therm. 64 deg.; and the lowest on 25th, 1847—therm. 21 deg.

Notices to Correspondents.

Back Numbers. Full price will be given for the following Nos: 1843: 6, 49, 51, 52. 1844: 47. 1845: 24. 1846: 35. 1847: 7, 9, 18.

Apples: *T F B.* This correspondent asks for an analysis of the pulp and the seed of the Apple separately. Can any correspondent favour him with it? Good drainage and a dry climate, not exposed to late frosts, are far more important than manure in securing regular crops: but security is unattainable in so variable a climate as ours. If you want manure, take good farm-yard dung half rotted.

Aquatics: *A Sub.* We should much prefer a slate tank. Iron pipes will do no harm, but you can use lead if you prefer it. The pipes for heating may be under the tank or within it—which you like. The charge against the cement is perhaps well founded.

Bees: *Old Sub.* Now is a good time to feed weak bees. Your honey will be excellent for them; it should be placed in front of the hive in the forenoon of warm days. But if you have several colonies, in order to prevent tumult or plunder put the full dishes or feeding pans in the sun a few yards from the apiary, replenishing them according to your knowledge of the state of the bees; and though some of the strongest hives will be sure to share richly from the bounty, that will be no loss, but rather a gain, by affording them the greater means of rearing an early progeny. *W.*

Books: *Irish Sub.* If it is a catalogue you want, Donn's "Hortus Cantabrigiensis" (1845), or Paxton's "Botanical Dictionary," with Supplement (1849), will possibly suit you.‡ —*K K.* You will find that excellent practical instructions upon the cultivation and forcing of fruit-trees are given by the writers of the Calendar in the *Gardeners' Chronicle*. Loudon's "Suburban Horticulturist" will probably suit you, as you will there find the subjects of your enquiry treated of theoretically, and also practically as regards the details of successful routine. Most of the newest introductions of fruit trees are mentioned in Rivers' "Descriptive Catalogue."‖

Box Edging: *J L.* You have killed it with your salt. Lime-water would have been just as offensive to the worms, and would not have hurt your box. You will never get rid of these things unless your gravel is thick enough, and coarse enough, to prevent their boring upwards. You will, we fear, be obliged to remake your walks. If you can concrete the surface on which the gravel is laid, that would be most effectual.

Cucumbers: *W R.* Victory of Bath or Cuthill's Black Spine.‡

Damson Trees: *A M.* The right way to make them bear is to let them alone. If you prune them they will only run to wood. Probably your Quince has had its flowers destroyed by the frost, during the two last springs.

Emigrants: *Enquirer.* By all means go to New Zealand; your money will be a fortune to you; here you will only lose it in trade, in which very few gardeners are successful. Go at once, and apply at the New Zealand office for advice and instruction. There is no doubt about the matter, if you are industrious. Buy a small estate, and farm it on your own account.

Fuchsias: *Amateur.* Light: Purity, elegans, Gem of the West, One in the Ring, Spanish Infanta, and Exquisite. Dark: Elegantissima, Newtoniensis, Marchioness of Hastings, Comte de Beaulieu, Dr. Smith, and Criterion.‡

Gooseberries: *Q.* Early Sulphur, Rumbullion, Woodward's Whitesmith, Melling's Crown Bob, Red Warrington, and Farrow's Roaring Lion.‡

Grapes: *J B.* It is a very nice Grape, unknown to us. What are its history, its name, and its merits?

Insects: *W W.* Your Apple trees are infested not by lice but by the Mussel-scale insect (figures of which are given in our answers to correspondents on the 2d Feb. inst.) The worst parts of the trees should be scraped, and the scrapings burnt. Previous to the escape of the young active nits from beneath the scale, it would be serviceable to wash the parts effected with some glutinous lather, such as yellow soap-suds and gas-water, the object being to glue the edges of the scales to the bark and prevent the escape of the young; at the time when they make their escape they are very tender but active, and may be destroyed by hot water, lime-water, or gas-tar water. *W.*

Labourers: *W T C.* No answer can be given to such inquiries, as we have before stated, with skilful management and good men, a garden may be kept in perfect order with a number of labourers which under another kind of management would be wholly insufficient. We should say, however, that a good plain working gardener, and a handy-man, with perhaps a boy in summer, would be able to keep a place such as you describe in good order.‡

Larches: *X Y Z* will thank "U. L." and "Arborator" to give the expense of stripping the Larches and other trees whilst standing, and also the means of performing that operation.

Laurels: *J F.* Laurels are usually yellow when land consists chiefly of chalk. Cannot you plant them in something else? Cut your Myrtles down in the end of April.

Melons: *N B.* The size of the pot should be from 14 to 18 inches in diameter. Use turfy loam for potting in, and drain well. Keep the pot plunged, if convenient, in a mild heat of from 75° to 80°; although good Melons may be grown by setting the pot in front of the house, upon a shelf or a few bricks, and training the plants about 18 inches from the roof. It is impossible to tell you how often to water, so much depends upon circumstances. Exercise your own judgment, and by observation you will soon be able to know when water is necessary. After the fruit is set, use weak clear soot and guano water every second time of watering. Give enough at a time to moisten the entire mass, and no more until the state of the soil renders it necessary. The length of time between each watering will be sometimes more than a week. The top temperature should range from 65° at night to 75° without sun, and 85° with sun during the day.‡

Moss on Lawns: *W A.* A dressing of pounded quicklime in December, and rolling and bush harrowing afterwards, is said to kill it, or it may be scraped off now with garden rakes; but in whatever way you remove it, it will grow again if you do not drain your lawn.‡

Names of Fruits: *W P L.* Coe's Golden Drop Apple.‖—*J C X.* Hunt's Deux Ans ‖—*J F Wood.* Your seedling Apple is handsome, and doubtless good for kitchen use; but, owing to a slight astringency, it cannot rank as a dessert fruit.‖

Names of Plants: *Valencia.* Some moss without fructification; apparently Grimmia pulvinata.—*C R.* Pteris serrulata. *S.*

Oaks: *G M G.* Cut away all the rotten wood to the quick, with any sharp instrument. Be very particular in making the wound quite clean. Then fill it with a mixture of well worked clay, wood-ashes, charcoal-dust, and cow-dung; coating the whole with wood-ashes while the mixture is wet. Ivy does no harm.

Paint used for Iron-work at Trentham: One-third Stockholm tar, and two-thirds gas tar, laid on while quite hot, with a brush, and spread as thinly as possible.‡

Pine-apples: *B B H.* The Cayennes are among the best of all Pines for all purposes; large, high-flavoured, firm, handsome, and coming quickly to hand. The smooth is perhaps the best. The Sierra Leone Pine is not so good.

Shepherdia: *G S.* We believe the S. argentea has fruited in this country. It bears the sexes on different plants. Messrs. Osborn and Co. imported the female some years since. It may be propagated by layers. A Melon may be ripened in a greenhouse, trained up a rafter, and without artificial heat. The difficulty is to avoid red spider. Its roots must be kept constantly damp. For experiment take the hardy green-fleshed.

Strychnine: *X Y Z.* There is nothing to fear from the animals killed by this poison. Buried at the foot of your fruit trees they will probably cause excessive growth, or they may throw the trees into bad health; but the quality of the fruit cannot be affected by the poison, which has been long since decomposed. If the strychnine poisoned anything it would be the trees themselves.

The Ice Plant: *Powel Williams.* It is a common tender annual. Raise its seeds in a hotbed; put the seedlings into separate small pots, keeping them in the frame till they are established. Then turn them out in a warm sunny border. If you want them chiefly for garnishing, and your soil is very poor, manure it; but that is not required in England.

Vinery: *A B C.* By all means consult a skilful professional man. Give us your address, and we will put you in communication with such an one.

Ward's Cases: *S B.* Let your own carpenter make what you want. We know of no place where they are kept on sale.

Misc.: *Argo.* We have always understood that Walcheren Broccoli and Walcheren Cauliflower were one and the same thing.‡

HOT WATER APPARATUS AND HORTICULTURAL BUILDING.

W. HILL begs respectfully to announce that his improved "FLUE BOILER" may now be had in sizes to suit every description of Apparatus, from that of 100 feet to 2000 feet of 4-inch pipe. Improved STEAM BOILERS, from one horse-power and upwards, adapted either for stationary or portable engines, and guaranteed to be most effective.

Every description of Horticultural Building constructed upon the best principle. Buildings of any kind heated by hot water.

*** A liberal Discount to the Trade.

W. HILL, Horticultural Works, Greenwich.

BY HER MAJESTY'S  ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

BENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses when completed charged from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; one principle, the roof being formed without wood or putty, and the other principle being wood rafters and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per ft.

HEATING BY HOT WATER.

THE LONDON MANURE COMPANY beg to offer as under, and pledge themselves that every Manure shall be perfectly Genuine:—Corn Manure for Wheat, Barley, Oats, Clover—most strongly recommended from its success last year; it will be found cheaper than Guano, and bear the strictest analysis. Also URATE, Superphosphate of Lime, Sulphate and Phosphate of Ammonia, Nitrate Soda, Fishery and other Salt, Gypsum, Sulphuric Acid, &c.

GENUINE PERUVIAN GUANO.—To insure this free from adulteration, all purchasers, if they prefer it, can receive their warrants from Mr. Purser, and remove the Guano direct from the Warehouses of Messrs. A. GIBBS and SONS, the Importers.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.

Country Dealers and Agents supplied.

GENUINE PERUVIAN GUANO, direct from the Importer's Stores, LINSEED CAKES, and all kinds of Artificial Manures, may be had at London prices, for Cash, of Messrs. ODAMS and PICKFORD, 15, Mark-lane, London.

POTTER'S GUANO.—This effective MANURE, now greatly Improved, is confidently recommended as a Dressing for all Spring Crops. It is equal to Peruvian Guano, and 25 per cent. cheaper. Also SUPERPHOSPHATE of LIME, GYPSUM, and SULPHATE of AMMONIA, all of guaranteed quality, and Cheaper than at any other establishment in town or country.

Factory, 28, CLAPHAM ROAD PLACE, LONDON.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.

London, February 23.

HYDRAULIC ENGINES, WATER RAMS, &c. on Improved Principles; Engines worked by Steam or Hydraulic power, to raise from 1 gallon to 1000 per minute to a height of 500 feet, and from a depth of 900 feet. Douche, Vapour, Hot-air, and all other kinds of Baths. Buildings, Conservatories, &c., heated by Steam, Air, or Water. Boring, Sinking, and Collecting of Water, &c. Towns supplied.—Direct to JOHN LEGG, Cheltenham.

IMPROVED FOUR-HORSE PORTABLE STEAM-ENGINES AND BOLTING OR THRESHING MACHINES.

FREEMAN ROE AND HANSON, Southwark Iron Works, and 70, Strand, beg to call attention to their Steam-Engines and Threshing Machines, which are more economical in fuel, for the quantity of work done, than any before the public. They may be seen any day at their works, Sumner-street, Southwark Bridge-road.—Water-rams for raising Water. Deep Well Pumps; Baths; Hot-water Apparatus; Fountains. Towns supplied with Gas or Water.

IMPORTANT TO AGRICULTURISTS.—COLLECTION AND DISTRIBUTION OF MANURES.

STRATTON'S AGRICULTURAL REPOSITORY, BRISTOL.

STRATTON, HUGHES, AND CO., have now ready their PATENT TUMBLER CART for the collection of Night-soil and other offensive matters; also their Iron Mill, to be worked by horse-power, water-power, or steam, for mixing and incorporating Nightsoil with Charcoal and other deodorisers. The Tumbler Cart has an iron body with a close cover; can be fitted if required as a Watering-cart, with a Valve and Delivery Pipe for distributing water or liquid manure, and also with an Apparatus for distributing dry manures in any given quantities per acre.

STRATTON, HUGHES, and Co.'s Tumbler Carts are used for scavenging purposes in Manchester, Bristol, Worcester, Harwich, Rochford, Cardiff, &c., and they are now building them for Chester, Oxford, Huddersfield, &c., besides many for Agricultural Colleges and private individuals. STRATTON, HUGHES, and Co.'s new illustrated Catalogue of Carts, Waggons, and Agricultural Implements will be forwarded to any address on receipt of 1*s.* 6*d.* in postage stamps.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

MESSRS. NESBIT'S CHEMICAL AND AGRICULTURAL SCHOOL, 38, Kennington-lane, London.—A sound practical knowledge of Analytical and Agricultural Chemistry, Geology, Surveying, Levelling, Railway Engineering, &c., may be obtained in Messrs. NESBIT'S Academy, in addition to a good modern education.

Mr. NESBIT'S works on Arithmetic, Mensuration, Gauging, Land Surveying, English Parsing, &c., are published by LONGMAN and Co., and may be had of all Booksellers.

The terms of the School can be had on application either personally or by letter.

NATURAL GRASS SEEDS FOR PERMANENT PASTURES, AND IRRIGATED CATCH MEADOW.

Which may be had Separate or Mixed, expressly to suit the soil.

MESSRS. JOHN SUTTON AND SONS having for many years paid especial attention to the examination of Natural Pastures, and the collecting of various kinds of Grasses which grow naturally in the various soils of England and Wales, for the purpose of introducing an improved system of laying down land to permanent pasture, are thereby enabled to supply the sorts and quantities of Seeds best adapted to suit the soil for which they are intended; and *at much less expense* than is usually incurred. Particulars will be forwarded by post.

Also Finest Lawn Grasses and Mixtures for improving old Pastures. Ashcroft, Liverpool, and other Swedes, White Belgian and other Carrots, Yellow Globe and other Mangolds, True Italian Rye-grass, Drumhead Cow Cabbage, Kohl Rabi, &c.

Reading Seed Warehouse, Reading, Berks.

SUPERIOR BOLIVIAN GUANO.—This Guano is of a very superior quality, of a pale straw colour, and in the highest state of preservation. For the last five years the Worcestershire Agricultural Society has awarded the prize for the best 2 acres of Swedes grown with Guano only, to parties who have made use of this description of Guano. It has been analysed by Dr. ANDREW URE, London; and WM. HERAPATH, Esq., Bristol.

Dr. ANDREW URE remarks: "The best Peruvian Guano is inferior in power and value to this Guano as 17 is to 24. It is the pure excrement of the birds."

W. HERAPATH, Esq., states: "One pound of this Guano is equal in fertilising power to nearly 40 lbs. of Farm-yard Dung. Judging from its nitrogen alone, it is a very rich Guano."

Apply to H. and G. WEBB, Merchants, Worcester, who also hold a cargo of the same kind of Guano in Liverpool and in Glasgow.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

Corn and Grass Manure, per ton	£10	0	0
Clover Manure, do.	11	0	0
Turnip Manure, do.	7	0	0
Superphosphate of Lime	7	0	0
Sulphuric Acid and Coprolites	5	0	0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano (with an analysis), 9*l.* 15*s.* per ton, in dock. Sulphate of Ammonia, &c.

The Agricultural Gazette.

SATURDAY, FEBRUARY 23, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, Feb. 27—Agricultural Society of England.
THURSDAY, — 28—Agricultural Imp. Society of Ireland.
WEDNESDAY, March 6—Agricultural Society of England.
THURSDAY, — 7—Agricultural Imp. Society of Ireland.

MR. HUXTABLE'S pamphlet is not permitted to lie quiet. Its power seems to be admitted by all, or it would not receive such general attention: but whether it be powerful for good or for evil seems to be matter of opinion. "PORCIUS," who has published a critique* upon it, is of the latter persuasion; he believes that it is of mischievous tendency, teaching mistaken doctrines, employing an erroneous logic, and building on baseless theories. "PORCIUS" is certainly a witty fellow, and he has done the best he could with the brief which has been given him; for we imagine that, whether *he* builds on facts or not, they are not his own. So long as he argues the general question of free trade, on the ground that whatever high farming may profess to do, as it confers no exclusive benefit on any one nation, it cannot enable that nation to fight the battle of low prices with other countries, he is evidently demonstrating a proposition of his own devising; but when he enters on the practical details of the art of agriculture, he is evidently dealing with things which he knows merely by hearsay; and we shall be very much surprised to learn that he is anything there more than a theorist himself. His assertion regarding the capital employed by the Scotch farmer—which he puts at 5*l.* per acre!—his remarks on the proportion between the live and dead weights of the hog—his arguments regarding the quantity of manure with which Mr. HUXTABLE'S pigs supply him, and regarding the humanity of the beef manufacture—all prove this. He disputes Mr. HUXTABLE'S proportion of $\frac{4}{5}\frac{9}{7}$ between the dead and live weight of the hog, because he can find no "testimony" to corroborate it. No such testimony was needed—the fraction was obtained from the animals themselves: our own experience has led to $\frac{2}{3}$ as being nearer the truth in in the case of pigs, while $\frac{3}{4}$, or a Smithfield stone of mutton out of an imperial stone of the living animal, may be taken as the truth regarding fat sheep. But Mr. HUXTABLE gives us this fraction as the result of actual experience: and we must accept it as true of the breed he feeds and the circumstances in which it is placed. Then how does "Porcius" dispute the assertion regarding the manure from the pigs? He takes Professor JOHNSTON'S per centage of nitrogen in fresh dung, and calculating from this the amount of manure with which Mr. HUXTABLE'S pigs must have supplied him, he shows that it must have been four times as much in weight as the food they ate!

* Mr. HUXTABLE and his Pigs. By PORCIUS. Blackwood and Sons.

This is not the style of a farmer's argument; and it is just as far from the style of the practical chemist, for *he* knows well that the nitrogen of the manure is a most variable ingredient, depending altogether upon the nature of the food from which the manure is derived, and therefore far more abundant than it in general is, wherever Mr. HUXTABLE'S method of feeding is adopted. The argument in condemnation of the method of beef-making adopted at Sutton Waldron is just as much in the amateur style as the rest of the pamphlet. No condemnation, on the score of humanity, of any system which results in a rapid growth of the animal, can stand for one instant. The rapidity of growth is the true test of animal comfort, and freedom from pain and annoyance; and to argue for the "natural" in preference to the "artificial" system, whether on the score of humanity or profit, is an egregious mistake.

The whole style of the work, indeed, proves it to be an amateur performance, so far as any practical knowledge of the details of the subject is concerned; the performance, however, of one who is no mere amateur as a literary man; for it is certainly a cleverly written production, and the writer is a master of the art of controversy, employing all its weapons, ridicule among the others, most skilfully.

Mr. HUXTABLE'S pamphlet is chiefly useful as an instance of the method in which the researches of the chemist may be used to strengthen the hopes, encourage the energy, and guide the efforts of the practical farmer; and we do not think that "PORCIUS" has fastened any such charge of error upon it, as will weaken its undoubted utility in any of these respects.

Low prices of grain—good for the buyer, bad for the seller—are to be met just by the farmer as much as possible assuming the former character and declining the latter. If under present circumstances any one cannot grow corn so cheaply as he can buy it, then let him not continue the ruinous experiment of attempting it. Let him buy corn and, growing green crops, feed beef and pork and mutton; and he will very soon create the circumstances under which it *is* more profitable to grow corn than to purchase it. And however desirable this result may be, he need not suppose that the expenditure which attends the process is an investment on *its* account alone. Such an expenditure may, we believe, be made profitable on its own account. We have a number of instances before us in which it has been so, and these we shall publish from time to time—confident that whether present prices shall materially change our agriculture or not, they cannot destroy it; and that the very cheapness which makes some of our agricultural products unprofitable will, if it be properly made use of, increase the profitableness of others.

For instance:—Five Hereford 3-year-old oxen were bought by auction last autumn for 56*l.* 5*s.*: and, now, after the lapse of 15 weeks, they are sold at 50*s.* per cwt. for 85*l.* During the first 5 weeks they had 3 lbs. of Bean-meal daily apiece, and 1 lb. of Linseed-meal boiled and given to them, thrown over straw chaff. During the last 10 weeks they have had 4 lbs. of Bean-meal and 1 lb. of Linseed-meal daily apiece. They have thus consumed 1925 lbs. of Beans and 700 lbs. of Linseed; a quantity equal to about 29 bushels of the former and 11 bushels of the latter, which are worth together about 8*l.* 10*s.*; leaving 20*l.* 5*s.* to pay for the Swedes and Mangold Wurzel they ate, and for the attendance, fuel, and other expenses connected with their management. They consumed in 15 weeks 28 tons of roots, being rather more than 1 cwt. a day each; and, setting aside a sufficient portion of the returns from them to pay for other expenses, we have no doubt that these oxen have made 12*s.* per ton for all the roots they have consumed. Now, we know very well that agricultural truth is not *determined* by single instances of this kind, but we may assume that it is pretty fairly indicated by them; and we may say that, supposing a small farmer to have obtained such a result as this, from the single acre of Swedes and Mangold Wurzel on which during the winter he has been feeding his five oxen, he is far more likely to be encouraged than cast down by his prospects under present prices. For not only has he obtained a remunerating price for his produce in the beef he has sold; but—in the large quantity of manure with which his cattle have also supplied him—he has the means either of replacing this produce of cattle food, and so of trying to recopy this experience or of growing a larger produce of corn.

These five oxen each made nearly 8*s.* per week, though fairly bought and cheaply sold; they were box-fed on what to a great extent was *bought* food, and they have amply repaid their expenses.

Now, we venture to ask our readers to give us their experience on this subject. It is, we believe,

one of the last chances of safety—the last resources against his present difficulties which the farmer has—and it deserves the anxious study and trial of all to make it, what we firmly believe it to be, a chance trustworthy enough, a resource ample enough to create his confidence.

BRICK AND TILE-MAKING.

The necessity of a brick yard on such properties as require drainage, appears to be lost sight of in the disputations concerning the application of tiles when made. The shape of the tile, the nature of the tile, its weight, its texture, have all in their turn had advocates and enemies, but it is seldom that the manufacture of so useful a commodity, let it come in what guise it will, has claimed sufficient attention to raise half a dozen arguments on the question. The various tile machines have certainly caused some "sensation," and are twice in the year, viz., at the Smithfield Club and Royal Agricultural Society Meetings, eyed with curiosity and surprise. "Are these * pipes ready to go into the ground?" was the question I heard put by a stout jolly-looking farmer to a pipe machine exhibitor last Christmas. "No, Sir, they must be dried and burnt in a kiln," was the courteous reply. "Do you sell kilns, too?" "No, Sir;" and here the conversation dropped, as may be supposed. Bless me, I thought, what must this man's land be like? Did he ever see clay before in his life? How I should like to pass half an hour with his landlord or his agent; I purpose to do so, if you will permit me, through the medium of your Paper.

Brick and tile making is not a mystery. It has no worshipful company. Clay is not found in California only, and coals are plentiful enough in England, but brick and tile yards, the natural result of the conjunction of two such materials, are not to be found at every turning, even in the wettest part of the country. The Bulrush still waves his head in defiance, and the frog croaks forth still a claim for protection to his marsh, and he has a good protection in the cost of seller's profit and carriage of tiles attaching to the reduction of his stronghold.

But though, as I have said, brick and tile making is not a mystery, it requires, like everything else, to succeed, much attention. The turning out those beautiful smooth tiles in Baker-street is a proof of machine and clay, not an effect of attention. The choosing a site for the yard, the digging the clay, the sorting it, the winter and the summer preparation, are all points requiring far more skill and attention than the mere turning a handle and depressing a cutting wire. I shall leave these matters for other Numbers.

Let us here see what hinders this good work beginning. Courteous reader, does your agent? He does, and he is a very shrewd man, doing business for half the country. He tells you "that brick-yards are very unsightly things, and cut up a property sadly, besides tiles are cheaper now, the yard only five miles off, and the tenants draw them for nothing." It is probable that in such a case as this, the agent or brick-yard must be given up. I never found yet I could draw tiles for nothing, though I have often heard of it being done. I do not think I could draw them any more than you could make them for nothing. "I have no money," says another. "Then how did you get those great hand-made tiles, selling at 25*s.* per thousand, that I see five men laying 1½ foot deep every morning I ride to N——? why, you will have a bill of 70*l.* to pay for those. And then your bricks; what with repairs to cottages, and building odd sheds, your team seems pretty often on the road. You must owe something, I think, for bricks." "Of course I do," is the answer. "Repairs are always necessary, but never tell me what little draining my land requires would pay for a brick-yard. It is all very well where you have two or three thousand acres of very wet land, I dare say, and plenty of money put in it." Many such cases as these exist; I trust it may be beneficially shown that making is cheaper than buying, without possessing even 1000 acres of very wet land.

Before we proceed to dig into the clay, let me observe that the average number of tiles a foot long used in draining an acre of land with a close soil is about 2000, the drains being 7 or 8 yards apart. One hundred acres of land thus drained will have used 200,000 tiles. We will admit that these are 1½-inch pipes, and that the kiln is only four miles from the land to be drained—that the roads are good, and that there are one-horse carts for carrying; these will carry about 1000 at a time, and will go twice to the kiln. I value the horse, cart, boy, and share of man overlooking, at 4*s.* per day, working till 2 o'clock. This adds 2*s.* a thousand to the price of the tiles, or 20*l.* to the cost of draining 100 acres of land. A turnpike on the road will possibly add another 50*s.* to the cost. With the kiln on the 100 acres, the same tiles would be moved to the drains by the same means at the cost of 4*l.* 3*s.* for the 100 acres of land. But 1½-inch pipes are not always to be recommended; many people (I do myself) prefer a 2-inch, or 2½-inch pipe. If these are used, 500 or 600 makes a load, and the cost of carriage becomes 40*l.* per 100 acres, against 8*l.* 6*s.* if the kiln be on the ground. The carriage of bricks is of more serious importance, from their greater weight.

But other reasons may be urged in favour of making at home; you are sure of having such tiles as your land really requires in quantity, quality, and at your own time. You are not obliged to leave an open trench for the main drain in the midst of a 20 acre ground, to be tiled next year, as they are *out* of main drain tiles at Mr. So-and-so's yard. You are not tempted to buy (or your tenant for you) some imperfectly burnt goods (the last lot), in order to finish the draining of the home close. You do not send your teams five or six miles on a frosty morning for a day's work to the nearest brick-yard, merely to learn that they are just out of tiles, that Mr. Squashland took the last 20,000 away yesterday, and that they have sent away dozens of people this morning; neither are you or your foreman carried away from home to see to a matter that you have the power of conducting within the limits of your daily business.

Taking therefore into consideration the cost of carriage, the loss occasioned by the using goods not exactly suited to the work, the demand made on the master's time away from home, I have very little hesitation in saying that, exclusive of the seller's profit, the purchaser of tiles incurs a cost peculiar to his position as a purchaser, of from 20*l.* to 40*l.* on every 100 acres he drains, and that to include the seller's profit in the cost, we must add from 60*l.* to 90*l.* to this amount. Thus in an estate, say, 500 acres of land to be drained with drains 7 or 8 yards asunder, it is probable that a saving by manufacture of tiles on the spot over purchase, at a reasonable distance, of 400*l.* to 650*l.*, would be effected. As draining almost invariably induces building, it is also probable that an additional benefit of some importance would be gained on this score. Will it then be too much to ask permission to carry your readers with me into the diggings this month? *A. P.*

(To be continued.)

* This is strictly true.

ON CATTLE FEEDING.

As I promised, I will now proceed to state what I think are some of the most obvious reasons why cattle feeding does not pay in some cases. The first is, irregularity in feeding. Although this is so common, and the consequences so palpable, yet it is a point very apt to be overlooked. I think it is omitted in nearly all the various receipts that we have for cattle feeding at the present day. We have receipts which include almost every cereal and vegetable which can lay claim to the least merit for that purpose, combined, and dressed up on the most scientific principle, and all said to possess great capabilities for fatting; but I think not the least important particular, the time and circumstances of application, are very often omitted, and without disputing on their various merits, I shall merely say that many of them may be good, if properly applied. The consequence of this is, that unless where the best method is found out by experience, sometimes dearly bought, people go on making the attempt only to end in disappointment, and then say it does not pay. If we were to ask six people how they use a certain kind of food for their stock, we should probably get as many different answers. Some may use hay and Turnips, giving plenty of the former, and sometimes of the latter, just as they find it convenient to provide them. The hay is given in large quantities at one time, with the injunction to let them have no more till they have finished what they have got. But the best method in this is on the principle of little and often. One day they get Turnips in such large quantities as to produce the symptoms, and no doubt some of the effects of scouring, and at another time they have so few that they are bound up in the bowels. And after trying this up and down way of it for a time, it is found out that the beasts hardly pay the expense of carrying the roots for them, and the whole plan is condemned as unprofitable. Perhaps some artificial food, such as cake, is used, but instead of giving it regularly as to time and quantity, they get it just as it suits the parties in charge; and as the beasts eat it readily, and are anxious to get it, having no stated time for that, they are always on the look-out whenever they see the feeder, and are deprived of that rest which they ought to enjoy. But I need not waste paper describing such a practice—suffice it to say that it most certainly will not pay, and no wonder; and yet I fear too many must admit that what I have described is not far from the system, or no system, that they are familiar with. But I must also say a few words on the accommodation provided for fatting beasts. On this I would observe, that the house should never be made to contain more than 10 or 12 together, and these ought to be divided off in pairs, so that they cannot disturb each other. As to yard fatting, I must discard that as unworthy of enlightened practice, as regards preparing cattle for the butcher; for if from 10 to 30 or 40 beasts are going loose, it is not likely that they will all feed alike; perhaps they will all require nearly the same quantity, but do not consume at the same speed, and the master cattle keep under ones at bay, until they have satisfied themselves and turned all the food upside down, leaving the worst for those that have most need of the best; but let them all be tied up, and each lot of 10 or 12 divided by a partition wall carried up at least higher than the beasts are, so that one lot may not see what the others are doing, for if there are 30 or 40 in one large open house, they must be deprived of some of the rest which they ought to have, and which conduces to their thriving more than we are aware of. Perhaps one may get choked, another may be hoven, a third may break loose, and presently all the rest are disturbed. But if houses must be large, let them never contain more than those that are fed, and treated exactly alike; the reason for this I need not stop to explain. As to the form of buildings best adapted for the purpose, I must not speak at present; but as I have spoken on what I think a bad system of fatting, I must now say a few words on what I consider a better way of carrying it out, in detail. I will give it as practised in the counties which I alluded to in your Paper of Jan. 12. One man has charge of from 16 to 24 large fatting beasts, and this is as many as he can attend to properly. He gives them a feed of straw in the morning as soon as it is light enough, as much as he thinks they will eat during the time that he is cleaning them out, which, when done, he cleans out their mangers properly, and gives them from 1 to 1½ bushel of Turnips each, then takes his own breakfast, comes back to them and gives them as many Turnips as he thinks they will eat before mid-day, which practice soon teaches him; he then litters them level, soft, and deep, gives them a little straw in their racks, and shuts the doors, or not, as the weather determines, and this not later than 9 or half-past 9 o'clock in the morning, leaving them to take their rest 3 or 3½ hours. He goes and pulls Turnips for them till 12 or half-past 12 o'clock, then again cleans out their mangers and gives them a feed of Turnips, and goes to his dinner. When he returns he cleans out their houses and gives them a few more roots if they want them, litters them, and gives a little straw to eat, then leaves them for a short time according to the length of the afternoon; this little spare time he employs in cleaning about the doors or in the Turnip sheds. Then before night he visits them again, which is the time they get their cake or whatever other artificial food may be given; if none, which is frequently the case, then some more Turnips, and their bed put right, and left till 7 or 8 o'clock, when they get what is called their supper of straw, and are well littered up. Thus ends the day's operations. Now, whatever sort of food be used, and whatever way prepared, if proper times be not appointed and strictly kept in supplying it, much of its good effect will be lost. I may at some other time say something regarding the most suitable age at which cattle should be fatted off; but I must not trespass further on your patience at present. *G. S.*

THE UNDER-DRAINING OF A DEAD-LEVEL.

All soil without moisture is perfectly sterile and unproductive; and, on the other hand, a soil completely saturated with water is of little service for the purposes of vegetation. The general object of land drainage, therefore, is to carry away that excess of water which would prove injurious to vegetable growth; and the first care of the husbandman, in reclaiming and cultivating any low lands, is to provide an adequate number of open drains or ditches for conveying away the surface water, and make them of suitable depth and capacity for keeping the head of water several feet lower than the surface of the land. When this has been accomplished, it is thought by many that nothing further need be done, in order to secure complete exemption from the numerous evils which arise from wet soil. In the marsh district of the fen country, it is said, if you can but keep the water sufficiently low in the ditches, the excess of moisture, not required by the soil, will sink through the porous silty subsoil, and ooze into them; on the peaty lands a similar soakage will take place; and on the clays and stiff loams, surface grips will take off the superabundance that may fall in winter, and thus keep the top sufficiently dry. Now it is easy to substantiate the reply that, even on the lightest of these soils, the under-drainage of soakage can only occur at the outsides of the fields near the ditches; that the outlet for the water which sinks into the land is thus incapable of preserving a right degree of humidity, so that by far too much moisture remains to be carried off by gradual evaporation; that on the heavier and more retentive soils, there is no proper way of drying the surface, unless the water be made to sink through the pan of clay beneath; and finally, that on all soils every particle of rain-water ought to be passed through the soil, and not any portion over it, because each drop so run off is a portion of valuable nutriment lost, and a useful chemical and mechanical agent wasted. Rain-water naturally percolates downwards into the soil, but it cannot do this efficiently unless a proper outlet be provided for it below; and accordingly, "under-drainage" undermines the soil with a number of subterranean conduits, which convey the filtered water to the ditches. The difference, therefore, between natural drainage and artificial subsoil drainage is, that the former leaves the soil with scarcely any means of getting rid of its excess of water but by evaporation at the surface, the latter provides a ready outlet for the water which has fulfilled its uses in the land, and would become injurious if allowed to stagnate; the one wastes great quantities of an invaluable element, for the want of the means of admitting and properly using it, the other applies every drop of rain to its right purpose, without drenching or saturating the soil.

The advantages of under-draining are obvious from the following considerations: soils appear to be the stomach in which the food of plants is prepared; and this preparation, which is a purely chemical process, has been found to occur indiscriminately all over the soil, provided heat, moisture, and air are present. One great evil, therefore, produced by an excess of moisture in soil, is the consequent diminution in the quantity of air within it; which air has been proved to be of the greatest consequence, not only in promoting the chemical changes requisite for the preparation of the food of

plants, but likewise to the roots of plants themselves; for eminent chemists have shown that oxygen and carbonic acid are absorbed by the roots, which gases, however, especially the former, can be conveyed to them only by the air. In a well-drained soil the constant descent of water causes a similar descent of air through its pores, from the surface to the depth of the drains; the air is in fact sucked in after the water, as the latter gradually passes downward.

Water is one of the worst conductors of heat with which we are acquainted—metals are the best, and the earths next; so that a soil holding an excess of wet will be longer in gaining an increase of temperature (which necessarily comes from the surface only), than if it were properly dry. And if it be still further considered that when the water is heated from above, the film of warm water floats on the top by virtue of its superior levity, so that there is no circulation downwards, it will be seen that nearly all the heat of the sun's rays is prevented by excess of water from entering into and being transmitted through the soil. But an excess of water also occasions a continual loss of temperature from the ground, the process of evaporation rapidly lessens the temperature of the soil by day, and it is still further cooled by the descent of cold currents of water from near the surface at night. In a well drained soil the spaces between the particles of soil are free from water, the moisture is all absorbed in the particles, so that the mass retains its porosity. Warm air circulates freely in the soil, and though evaporation at the surface may proceed more rapidly than on a wet soil, it soon leaves the surface and goes on much more slowly in the interstices of the earth beneath; whilst on wet land the process still remains active on the surface, being supplied by capillary attraction with constant currents of water from below. In drained land, where there are no continuous currents of this kind, evaporation continues very slowly to reach lower and lower, leaving the upper portions, so that the surface absorbs heat from the atmosphere, and the dried earth conducts it downward. So great is the amount of heat stolen from the soil in the process of evaporation, that it has been estimated, every drop of water prevented from evaporating, by being drained away, adds as much to the temperature of the soil as six drops of boiling water poured into it. But heat is carried to the under soil not only by currents of air and the earth's conduction, but also by the rain. When it reaches the surface of the earth, the rain water is usually of the same temperature as the air through which it has fallen—and as it sinks it gradually warms the soil through which it passes. In summer also when the hot sun has warmed the surface, the rain itself, when it reaches the earth, becomes sensibly warmed by the hotter soil, and descends to the subsoil with this greater warmth, imparting to it the effect of the sun's rays in its course to the drains, and giving the roots of plants the benefit of what the gardeners call "bottom heat."

A permanent excess of moisture in soil is deleterious to the growth of plants. The roots absorb nearly all their food in a fluid state, which food consists of various chemical ingredients, formed in a great measure by the process of putrefaction, and soluble by the water held by the soil, so that moisture is absolutely necessary for supporting their existence; but then the presence of a large quantity of water in soil alters the result of putrefaction, by which alteration some substances are formed which are in all probability useless to plants, and diminishes the proportion of more useful ingredients.

Again, the roots of plants have been proved to grow by their ends only, and the functions belonging to them are those of absorption and excretion. The spongioles of the roots are thus constantly presented with fresh food; and while the soil continues merely moist, the excreted matters, which have been proved to be injurious to plants, will be left behind. But when there is an excess of water in the soil, all the soluble matter must be continually descending, on account of the greater specific gravity of the solution, and all excretions of plants being at first soluble in water, it follows that the excrementitious matter will become mingled with the food and applied directly to the spongiole. Where there is an excess of stagnant water, the currents produced during the heat of summer, at the period when vegetation should be most active, will be entirely from below upwards, and the consequence will be that the roots of the plants, instead of being supplied with water charged with all the valuable gases of the atmosphere, will be bathed in water which has existed so long in the soil that it has lost all these valuable ingredients, and is, moreover, charged with excrementitious matters. But when the land is well drained, the currents of water (and these are the more fertilising for being occasionally excessive), are from the surface to the drains, and the roots are consequently in this manner supplied with fresh aërated water.

Wetness of soil has also another effect—it influences the various processes in vegetable nutrition which occur above the ground, by rendering the atmosphere moist. Although the rate of evaporation from a very wet soil is much slower than from a moist soil, owing to the greater extent of surface exposed to the action of the air in the latter, it is constant, and this produces a continual dampness in the atmosphere. This excess of moisture acts in a peculiar manner upon the leaves of plants, hindering the absorption of carbonic acid from the air and the emission of oxygen; and also preventing in a great measure the evaporation of water by the leaves—the free exercise of both which functions is needful to the health and growth of the plant.

The first effect of under-drainage upon the soil is the same as if it were removed to a warmer climate, and placed under a milder sky, where it could bring to maturity other fruits, and yield more certain crops. By the aid of good drainage, the permanent coldness of many soils disappears, and the backwardness of the crops in spring and the lateness of the harvests are less frequently complained of; take for instance, the following example: "In consequence of the drainage that has taken place in the parish of Peterhead, in Aberdeenshire, during the last 20 years, the crops arrive at maturity 10 or 14 days sooner than they formerly did." (High. Soc. Journ., 1830.) On land of every kind this removal of the superfluous water is equivalent to an actual deepening of the soil. Deep rooted plants often fail because an excess of water in the subsoil, or the presence of some noxious ingredient which hollow drains would remove, repel the descent of the roots, forcing them to seek their nourishment from the surface soil only. Where the subsoil is sound and dry, corn, Clover, and Flax will extend their fibres for 3 or 4 feet in search of food, and find a store of substance accumulated in the subsoil which are but sparingly present, it may be, in the soil above, from the long continued washing of the rains, or the demands of frequent crops. And the deeper the drains, therefore, provided the water have still a ready escape, the greater the depth of soil which is rendered available for the purposes of vegetable nutrition.

One of the practical benefits derived from underdraining may be seen in the improvements it effects on clay lands, and others of a close wet nature. These soils shrink and crack when dried by the drought of summer, compressing and parching the roots of plants; and in many parts of the fens water is admitted into the drains in such seasons, from the embanked rivers, to refresh the thirsty corn and pastures. But this is a very erroneous practice; for the cause of the mischief is the excess of water already in the soil. Dry lands do not parch and gape into wide fissures; and therefore the cultivators of wet soils should endeavour to remove water from their fields during the winter, rather than alleviate by a temporary remedy an evil which is needlessly incurred. The reason why a wet soil becomes "burnt up," is that it is so compact in summer as to be impervious to the atmosphere from which it might absorb moisture. But once thorough-drain it, and as certainly as the water obtains a free passage downward will air follow, and loosen and pulverise both the upper and lower soil. On stiff clays, and on those lands where continual ploughings have formed a "pan" of hardened earth below the surface tilth, although most impervious to water, the worms are the farmer's best friends, for they bore innumerable passages which the surface water can trickle down; and when a sufficiency of hollow drains have been laid, a complete current of water is thus established from the surface downwards. This is slight indeed, at first, owing to the tenacity and adhesiveness of the ground; but the action having been once begun in the worm-holes, every drop of water wears and enlarges a passage for others, continually increasing the porosity of the soil. The benefit on such lands, therefore, is not immediate; indeed, such is their closeness of texture that, on one hollow-drained field in a clay district of the fens, the water during the first rainy season did not sink through until a spade was thrust down a considerable depth at various intervals along the course of the drains.

This difficulty, however, may be overcome by working a subsoil plough at right angles to the direction of the drains; this, by stirring the subsoil to the depth of 15 or 20 inches, breaks up and loosens what had previously interposed an impenetrable barrier between the drowned and sodden surface and the drains beneath; when thus readily freed from the constant pressure of water, the soil gradually becomes drier, sweeter, looser, and more friable. The hard lumps of the stiff clay land more or less disappear. It crumbles more freely, offers less resistance to the plough, and is in consequence more easily and economically worked. These are practical benefits, equivalent to a change in the soil; and experience also proves that under-draining on clays is equivalent to a change of climate, for on such lands, well adapted for Wheat, wet weather in the autumn not unfrequently retards or completely prevents the sowing of winter corn, compelling the farmer to change his system of cropping, and sow some other grain, if the weather permit him, when the spring comes round; but an efficient drainage carries off the water so rapidly as to bring the land into a workable state soon after the rain has ceased. It is upon clay land that the greatest advantages are to be gained from under-draining; but as efficiency of drains underneath such stiff impervious soil is generally, though unwisely, doubted in this district, comparatively little has been hitherto done.

Upon peaty soils under-draining has produced invaluable results. The "black land" is recumbent upon clay, and as it is of a light spongy nature, with a bed of almost water-tight soil beneath, is continually saturated with moisture. The water thus held stagnant in the peat has a noxious astringent corrosive quality; and whenever the roots of cultivated crops penetrate down to it, the plants receive material injury—turning yellow and sickly. Hollow drains speedily remove this deleterious moisture, and by drying the porous mass, produce that firmness and consolidation of its substance which are necessary for the successful cultivation of grain crops on moory soil.

On the marsh lands in this neighbourhood underdraining has fully succeeded wherever it has been tried; although very little has been executed on a thoroughly complete and costly scale. A fair example of this success may be found on a farm near Long Sutton, where upwards of 230 acres of both arable and pasture land have been hollow drained.

The soil is an alluvial loam, with a subsoil of stiff loam and clay from 1 to 3 feet in thickness, resting upon silt. The ploughed land was drained, part with thorns, the rest with tiles and pipes; and the Grass was done, one portion with tiles and pipes, the other with wedge or sod. The drains are laid from 24 to 30 inches in depth, and about 20 yards apart—in various places following the course of the old hollows; so that while the depth is as great as the main drains and outfall will allow, the intervals between might have been made only half the present width, without occasioning an unnecessary outlay. However, the occupier is satisfied that the expense is fully repaid in a few years, by the numerous beneficial results.

Among the different improvements which have been thus made on the Grass land, one is that the Grass is materially improving in quality. The herbage naturally partakes of the nature of the soil upon which it grows; and from the excess of saline matter in the silt, possesses a laxative quality—often to such a degree as to render it unfit for food, particularly for young stock—as is evidenced by their looseness and scouring. The growth and increase of the inferior pasture which luxuriate in such saline soils, is fostered, and the vegetation of the more valuable kinds prevented by the presence of noxious stagnant water in the soil. But the superabundance of saline matter and impure water is now being continually conveyed away by the drains, and replaced by fresh rain water, and atmospheric air; the injurious properties of the herbage being gradually corrected, and made more nutritious. Pasture, formerly very wet, is now comparatively dry—so that the worthless Bents and Rush Grasses are being succeeded by the finer varieties, of greater nutritive value; there is much less of discoloured Grass, which was indicative of "poaching" from stagnant water; the land is less injured by the treading of stock; and lastly with the removal of stagnant moisture and pernicious Grasses, have disappeared in a great measure, the principal evils tending to produce those diseases which sheep and young cattle are peculiarly subject to, viz., inflammation, foot-halt, and rot.

As to the arable land, it will be almost sufficient to state that, there is rarely any water to be seen standing in the furrows of the drained fields during a rainy season, when other lands are all but flooded; and that the soil, even in very low situations, quickly dries, while the surrounding undrained lands still continue, for a long time, thoroughly saturated with wet. In the showery spring of 1848, the occupier was able to work, prepare for seed, and sow with Beans, a field that, in its former undrained condition, was very wet and sometimes had standing water upon various parts of it—some weeks before others could venture upon their land; and in consequence the Beans were harvested and thatched down by the second week in September.

In wet soils, bones, wood-ashes, rape-dust, nitrate of soda, and other artificial manures are almost thrown away; it is therefore to the superior dryness of the drained lands that the uncommon success of such manures on this farm may be attributed. The root crops and Coleseed are remarkably heavy, greatly owing to the extraordinary facility afforded for working the fallows after heavy downfalls, by the rapid drying of the land.

Under-draining has decidedly increased the produce of the grain crops.—That cold, damp, salty moisture (or "soak") which oozes from the silt, is partially carried away by the hollow drains; and in consequence, much less Wheat-straw is produced of a flaggy, fungous-bearing character; it is shorter, stronger, less liable to be "laid," and possesses more of that brightness which unquestionably diminishes its tendency to mildew. Now that the low places and hollows are relieved of their wetness, the corn is less patchy, growing equally over all the land; and cold damp plots, which brought only a failing and scanty produce, are now yielding abundantly, like the higher portions of the fields. Besides these palpable benefits, there is not the slightest doubt that, as a dry season is invariably found best for Wheat, the extra dryness of soil caused by under-draining conduces to a fuller development of the ear, and a corresponding increase in the yield.

There are also numberless minor advantages accruing from the practice of hollow-draining, which are valued most by the farmer during a rainy season, or under peculiar circumstances:—as for instance, when other fields are drenched and partially drowned in the winter, his sheep have a comparatively comfortable layer; when other farmers are unable to stir a plough, his land is friable and readily worked and pulverised;—and by sowing spring corn a week or two before his neighbours he will frequently be enabled to harvest it several weeks before them, if the autumn be wet;—and again, when other Potato crops yield perhaps only 15 sacks per acre, his drier soil being less favourable for the progress of the rot, will produce 20.

With regard to the length of time for which dead-level drains, in a silty soil, will continue to work efficiently, it will be quite enough to name the following particulars.—In October, 1848, an examination of the hollow-drains was made, on the above-mentioned farm. Owing to the defective condition of some of the main drains and tunnels, the inadequacy of the general drainage of the neighbourhood, and the unexampled

fall of wet,—the mouths of a great many under-drains were several inches lower than the surface of water in the ditches; but so great had been the fall of rain that notwithstanding the ends being covered with water, steady streams were being emitted from thorn drains which had been four years in operation. Where the tile-drains had a fall into the dikes, they were pouring out streams equal in capacity to nearly one-half the calibre of the pipes. In one field, several thorn drains had been laid in a clay subsoil nine years ago; and most of them were found to be still in a good working state, and running strong currents of water. On one side of the farm, where the main drains are good, and the water has ready passage from the hollow drains into them, the soil was found remarkably free from wet; but other fields though drying much more quickly than the undrained lands, have not an outfall sufficiently good to give the under-drains a fair trial—the rain and subsoil water being unable to soak away until that in the ditches has greatly subsided.

Such, then, being the results of a somewhat scanty and incomplete system of under-draining, on land which has the enormous disadvantage of a defective and incapable external dainage,—may not superior benefits be expected to follow from the laying of more "frequent" drains in soil of like character and situation; and must not incomparable advantages arise from the general adoption of under draining, whenever a more effectual exterior drainage shall be extended throughout the marsh district?

In conclusion;—the foregoing considerations have amply supported the reply that was given at the commencement of this paper;—it has been shown how an excess of stagnant water injures the soil and impedes cultivation; and that there cannot be too speedy a means of egress for the exhausted subsoil water, after it has permeated, warmed, and fertilised the superincumbent mass;—and still further, the enumeration of abundant practical benefits has distinctly proved, that the theoretical view is actually realised; crops are augmented, money saved, land improved, the air made drier, and the salubrity of the climate permanently increased. *I. A. C.*

Home Correspondence.

To make a durable Liquid Manure Tank.—After digging out ground of sufficient capacity to construct the tank required, say of a circular form, that being the strongest, and strutting up the ground in the same manner as is done in forming a cutting for a deep drain or sewer, hollow out the bottom of the excavation like an inverted dome or arch. Then place a layer of flat roofing tiles, or, as they are technically called, plain tiles, over the inverted bottom, and spread Roman cement, of the consistency of common mortar, over these tiles. While the cement is soft, with alacrity press into the cement another layer of tiles, breaking joint over the first. The tiles should be in all cases first soaked in water, to prevent the too rapid absorption of the moisture from the cement. When the cement has hardened, or become, as it is called, set, which, if the cement is good, will be in about 15 minutes, place tiles against the side endways, two rows deep; and to keep the tiles from falling inward in placing them, put a little cement (mortar will do as well for this purpose) at the back of each tile against the earth, then spread cement on the face of the tiles as before, and press another layer of tiles into this, breaking joint over the first. Do only as much of the cement work at a time as can be performed without risking the setting of the cement, as it is spoiled when set. Then place another course of tiles endways, as before, and proceed with another inner course, breaking joint as before, and so on to the top of the tank. Fill in the ground properly behind the tiles as the work proceeds, and remove the struts carefully; and if the earth be loose and faulty, replace the struts within the tile-work, and leave them there for a couple of days, when all will be firm and hard. Take care in placing struts within the tile-work not to drive them hard, or the new work will be cracked thereby. There will be at the bottom and at the top of the tank half tiles to fill in, in consequence of the inner course of tiles breaking joint over the outer tiles. For example, to break joint fully, one tile within covers the four corners of four tiles without. To make a dome or top to this tank, either fill in some centreing over the same, and lay tiles on that as before directed; or, which is by far the cheapest, take some earth and form a dome of the size required on the ground adjoining the tank; cover this with tiles and cement, leaving a hole for a man hole in the centre. This should have in all cases three courses of tiles at the least. When this has properly set, raise it by levers and remove it to the top of the tank, and bed it on to the same with cement. The earth on which it was formed will have answered the purpose of a mould, and saved the cost of centreing. If the tank is very large, make the dome in segments, and fix these together with cement on the tank, propping up the segments until they are firmly fixed. I have said two courses of tiles for the wall or side of the tank, and for tanks of 10 feet diameter I have found it sufficient; for very loose ground I would not venture a greater diameter with less than three courses of tiles. The tank will be stronger if the inside is "rendered" or plastered with cement and sand, in the proportion of two parts cement to one of clean sharp sand, and it will have then a smooth and uniform surface. A tank so made, with good cement, may be filled with liquid manure a week after it is finished, and will last for ages. A bushel of cement will "set" a square yard of tiles, allowing for all waste, and will cost about 1*s.* 6*d.*, of the best quality for such work. Tiles cost upon the average 30*s.* per 1000, and 1000 will cover 45 square yards. A tank to hold 4500 gallons, so made, would cost, including labour at the highest rate of wages, 14*l.* The strength of tile and cement is much greater than brick and cement, and, when thoroughly hardened, will bear an enormous pressure before it is crushed. *I. M. B.*

On Flax Growing.—The season is now advancing when Flax should be planted. I think it well to let the public know the result of my last year's crop, as far as I can inform them. I grew about 20 acres on my own farm, and took about 24 acres more. The expense of pulling and harvesting the crop was increased (the flax not being planted quite early enough), being obliged to do it in the midst of harvest. The pulling and tying cost 12*s.* and 14*s.* per acre, and I am paying 6*d.* a bushel for threshing. The yield will be quite 20 bushels an acre. On a farm adjoining, where an acre was planted, it was 22 bushels; on one more distant, 24. I have sold the seed at 6*s.* a bushel for cattle food, and when well cleaned, at 6*s.* 6*d.* per bushel. I planted mostly Riga seed, which yields best, and is now the finest seed. I found the greatest difficulty in separating the small seeds from the Flax, but now with Gooch's winnowing machine, I can do it effectually; and as the demand for sowing is so great in this country and Ireland, I have reserved all I have for that purpose. I strongly advise its being sown the end of March, broadcast, with light harrows, endeavouring to move the ground previous to sowing, to prevent the growth of annual weeds. I have not begun working up the fibre, but from the dry spring, the straw is short, yet if it only realizes 3*l.* or 4*l.* per acre after all expenses, what grain crop will pay like it, seed and fibre included? The use of Flax is being increased daily, and with the many millions we pay yearly for foreign seed, Flax, and cake, we need not fear overstocking the market. *T. B. Browne, Hampen, Andoversford, Gloucestershire.*

Subsoil Ploughing.—As this is a very expensive operation, it may be useful to some of your readers to state the precautions which I have found advantageous in preserving the tilths, which I have obtained by using the subsoil plough. The horses which draw the plough following the subsoil plough always walk upon the unploughed land. This is easily arranged by using Ransome's Y. Z. plough, and letting the horses draw from the left hand of the cock. The mould-board should be set as wide as possible, in order to clear sufficient spaces for the subsoil plough to work easily. I abandoned the system of putting my manure into the ridges, because I found that the horses and carts passing over the subsoil consolidated it too much. I think I obtain heavier crops both of Turnips and Mangold Wurzel by spreading the manure on the surface as it comes from the yard during the winter frosts, and breaking it well with the haymaking machine, after which it is easily covered by a 5-inch furrow. I formerly made a point of ploughing at least 10 inches deep when preparing for Turnips, but I think I am more successful in growing them by keeping the highly manured soil near the surface, than I was when I brought up the raw subsoil. I now therefore seldom plough more than 7 inches deep, and I find by using the precautions I have mentioned, the subsoil is kept in a state to benefit the roots of plants for several years after it has been stirred by the subsoil plough. *Charles Paget, Ruddington Grange, Nottingham.*

Carts.—Does "J. D." use his carts without frames in harvesting operations? One would suppose so, when he speaks of the smaller area, "the frequent falling of the load in the field," and "the coming to the ground of the person with or without the contents of the cart." His men must be great bunglers, at all events. Now, I have no hesitation in saying that the area is not so very much smaller, if the frames are made as they ought to be. There are some very tidy carts made in this county, but they have the same fault, the frames are not expansive enough; so that the prejudice against the carts is not so easily rooted out as otherwise would be the case. They ought to be 7 feet longer than the carts, to project 4 feet over the front and 3 feet over the back; and 3 feet, at the very least, wider—1½ foot at each side; and I think I am within the mark. "J. D." will perceive that this adds considerably to the area. He may say that a frame is also used with the waggon; yes, but it is very trifling. I need say nothing about the difference in the weight of the two carriages. As regards the convenience of taking out the horse, I can see nothing to justify him in doing so, except the weather were to put a stop to the operations; but at all events it would be a very simple affair to put in the horse again, previous to unloading. It is not so very long since we were told that the mode of travelling by stage coach was certainly safer than by rail, but doubtless "J. D." is aware that the railway is not only the most expeditious, but the safest. It is possible, I think, that "J. D." may be as much mistaken as the advocates of the stage coach. But we need not be astonished at accidents arising from the carelessness of the men, prejudiced as they are against all innovations, particularly if the master shows any symptoms of uncertainty. I know of nothing that would do many of the farmers in this country more good than a trip to East Lothian, now that they might go for a trifle. *J. H., Salop, Feb.* 8.

The Cart Controversy.—My carts are long, low, and light—not exceeding 7 cwt.—12 feet long, 7 feet wide; in fact, they are Mr. Hannam's harvest cart, but we use them for carting coals (2 tons), corn—Wheat 80 bushels, Barley 100 bushels, lime 80 to 100 bushels, hay 35 cwt., straw *ad libitum;* also for planks and bricks, when we require them. My man brought home 70 trusses of hay to-day, 56 lbs. to the truss—with a pony and old horse that cost together, years since, 18*l.* They never turned a hair, although they came 3 miles. My waggon neighbours so often wanted to borrow the said carts, that I now charge 1*s.* per day, in self defence. I do not find the Scotch cart so useful—it is not large or low enough. Our light Essex ¾ carts do well for dung only, but Hannam's are always wanting, and at harvest we never use more than one horse in them, and a boy to drive. With four horses, four carts, and two boys to drive, we harvested quickly 80 acres of mowed Wheat, and 20 acres of Beans and Peas. For carting home green crops they are most valuable. They are made for 10*l.* each; I used to pay 14*l.* or 15*l.* My labourer shrewdly observed to-day that there were 30 trusses of hay on the cart, before it attained the level of the floor of the ordinary Essex waggon. The use of the latter, except from necessity, I consider an act of agricultural insanity. I presume every one has read Mr. Hannam's admirable paper, with diagrams, at page 73, vol. ii. of the "Royal Agricultural Society's Journal." It exhausts the subject, and settles the question; I, for one, am grateful to him for his valuable facts. *J. J. Mechi, Feb.* 7.

Oxen versus *Horses.*—The writer of one of your leading articles, in your Number of the 2d instant, says: "We believe that as agriculture advances less horse-power will be employed, and more manual labour." Now without disparaging the latter (of which I am at this moment availing myself in the shape of spade husbandry), I wish to be informed whether the very ancient practice of using oxen for ploughing and other agricultural purposes may not be more generally revived with advantage. I am told that with a moderate extent of work the ox may be maintained not only in a state of fair growth, but also of fattening. If this is so, surely a material reduction may be effected in horse-power, "the great drawback in England to a farmer's prosperity." I understand that the ox may, without difficulty, be broken to draw carts also, and that, even for harvest purposes; but that there is one particular breed more tractable than others. What breed is it? [The Devon.] This subject strikes me as being worthy of an article in your useful journal. If you can show a farmer of 100 acres that he can carry it on with, say two horses, and two or four oxen instead of four horses, and that the oxen will, during their period of work (is it one or two years for each, at what age commencing?) be improving in value, whereas the horses are deteriorating, you will I think be entitled to our thanks in these times, calling as they do for economy. *C. R. S.*

[We never employed oxen, and should fear to alter our practice in the face of a universal tendency among farmers the other way, notwithstanding the apparent soundness of the argument in favour of the former, which might be presented; for we have had ample experience of the difficulty of giving all the particulars their due importance in an argument of that kind.]

Reduction of Rents.—I am much pleased to see in your last two Leaders that you are in favour of a reduction in rents as one all-important element to enable tenant farmers to meet "times prices," and hope you will give us a few further truths and arguments on that, to many of us, life or death question. To me the rent question appears to be one that rests entirely with tenant farmers, and I venture to state, without fear of contradiction, that had the tenant farmers of England been as unanimous as to the necessity and advantage of a reduction of rents as they are and have been on protection, there would have been, even before now, such arrangements made and reductions effected as would have enabled thousands to have weathered the storm, that, without this help, must be ruined. And here I would remind my brethren in distress that it is worse than idle to join in the popular cry of "The landlords ought to lower their rents," unless their tenantry are resolved to compel them to do so by offering less money in all cases where they are competing for fresh holdings, and in other cases demanding either a reduction in conformity with present prices, or giving notice to quit where the landlord refused to do so. If the tenantry of England will only act upon this common sense view of the question, the rental of the kingdom would be fixed in accordance with "times prices" before next Michaelmas. But while the tenants are foolish enough to offer the same (and occasionally I hear of higher rents being offered), it is not to be expected that landlords will, as a class, voluntarily reduce them. Let us, then, be up and doing, and acting like men of business, who, in every other trade, profession, or calling, when they find their expenditure exceed their income, endeavour at once to reduce the one and increase the other, so that between the two a surplus may accrue. I will not waste your space, and at the same time insult the common sense of your practical readers, by presuming to offer any reasons as to the necessity and justice of a general reduction of rents as being absolutely necessary to save the remaining property of the tenants, as this must be too obvious to all who are interested in the question; nor will I do more than merely remind the receivers of rents that they are in a position to afford a liberal reduction, seeing that the leading articles of their consumption are now reduced some 20 per cent. on the average. *A. D. B.*

Cost of Digging.—I find "A Suffolk Farmer" is not aware what our north country rood is, which I ought to

have explained before; it is 7 yards by 7 yards, being 49 square yards, consequently the acre contains 98 such roods, wanting a fraction, which at 4*d.*, would be 1*l.* 12*s.* 8*d.* the acre, that is for digging the top spit. The forking, if well done, is worth the same money, so that an acre subsoiled with the spade, in an effectual manner, fit for any crop, will cost 3*l.* 5*s.* 4*d.* I should like to know what "A Suffolk Farmer" could subsoil an acre of land for by horse power, and which work he would give preference to. The principal intention of my former communication was to show what can be done by good cultivation, in contrast to the generally adopted mode of the country. *Verax.*

Hybrid Pheasants.—Your correspondent, "L. V. R." may be informed, that on visiting the pheasantry of an intelligent breeder (Mr. Osmar, of Headcorn, Kent) last August, I found that he had succeeded, after repeated disappointments, in rearing one "Pharos" from the common pheasant and domestic fowl. This curious bird was then half-grown, the plumage dark. The eggs I was informed had, in the season of 1848, all proved bad; the cock and hen birds were isolated the following season; the eggs were numerous, the produce two chicks, one of which was accidentally killed. Mr. Osmar does not know of this communication, but I am sure he will readily answer any enquiries. *Amateur.*

Foreign Correspondence.

NAIR: *Holstein Dairy Management.*—You request me to furnish you with a detailed statement of the mode of feeding milch cows practised in our Schleswig-Holstein dairies; and although I cannot lay down any fixed rules on this subject, inasmuch as the great variety of soil which occurs in these Duchies necessitates a corresponding variety in the style of feeding. I will yet endeavour to meet your wishes with as much precision as I can, premising, however, that, as it is with us received as an incontestible fact, that first-rate butter cannot be produced on a farm where fewer than 100 cows are kept, my statement must be understood as referring to such large dairies, the preference given to which is grounded on the two following axioms; first, that, to obtain first quality butter, the cream must not be long kept, and secondly, that first-rate packed butter ought not to be composed of portions churned on successive days, but that each cask should be filled at once. Now, as we generally count on receiving an average of 1 lb. of butter per day from each cow, it follows that a dairy of 100 cows or upwards, delivering a 100 lb. cask daily, must furnish not only the best tasted, but the best keeping butter.

It is customary in almost all our larger dairies to put the cows to Grass in the middle of May, and retain them on it till the end of October. During this period they receive no additional food, excepting that, by way of change, they are permitted to graze off the Clover and corn stubbles, after the hay and grain harvests have been respectively carried. The usual allowance of pasture land is from 1½ to 2 acres per cow. But as, in consequence of our pursuing the 10-field rotation plan, one-tenth of our arable land is commonly occupied by Clover, and as we reckon on keeping one cow for every 5 acres of our aggregate farm superficies, the farther allowance of half an acre of Clover stubble falls to her share. The grain stubbles are not taken into account, since, although beneficial and grateful to the animals as a change of pasture, they cannot be regarded as affording any essential quantity of nutriment.

But the winter feeding is that which chiefly claims the attention of our dairy farmers, and this extends from the 1st of November till the cows exchange the stall for the pasture. Before our milch cattle can be housed, they have invariably suffered considerably from the effects of our boisterous and cold autumnal weather. Moreover, as it is usually arranged that they shall calve from January to April, very many are already heavy in calf, when they are taken from Grass, while in all the milk produce is greatly diminished; and as we hold that a good cow must be suffered to stand dry from six to eight weeks, in order to warrant the expectation of a large supply of milk when she does calve, the larger proportion of our dairy cows are nearly dry in January and their feeding is regulated accordingly. While a cow stands dry, she gets only hay, a little Oats (either in sheaf or chopped down by the straw-cutter, the former being in my opinion preferable), and straw. It is a dairy proverb with us that "the cow is milkish through her mouth," in other words, that her milk produce corresponds to the tendence she receives; and on this principle, we give comparatively little food to dry cows, first, in order that the after high feeding may operate more specifically on the milk vessels, and secondly, to guard against a too great growth of the fœtus, by which the difficulty and danger of calving are much increased.

So soon as a cow shows by the usual signs that she will calve within two or three weeks, her daily portion of hay is increased, to which some pollard is added; for our country being comparatively poor in meadows, a large proportion of grain-feeding is requisite to make up for our hay deficiency. I think I hear you ask, with a disapproving shake of the head, "Have those good folks no Turnips then?" and I must reply that, generally speaking, they are quite neglected. Not however altogether voluntarily, for the cause is to be sought partly in climate hindrance, which we are unable to counteract, and partly in the peculiarities of the here customary farm contracts (or leases), which present great difficulties to Turnip cultivation. It would lead me too far were I to attempt at present to explain the agrarian relations of this country, though it is my design to make them the subject of a future letter, in the supposition that it may possibly interest you to learn by what political causes one portion of the descendants of a common ancestry has been detained so unmeasurably behind their English brethren.

But, as I have already said, we are compelled to supply the want of Turnips by corn, which however is, as you well know, a much less sacrifice for us than it would be for you, on account of the comparatively small cost of production; not forgetting, moreover, that really good keeping butter is not attainable without feeding corn.

From the day of their calving, until sent to Grass, it is customary in all the large dairies to feed the cows twice (on some farms thrice) a day with hay, say from 4 lbs. to 5 lbs. at a time; twice with chopped straw mixed with pollard (about 3 lbs. at a time), and then with Oat-straw which has been more or less clean threshed. The mode in which this feeding is followed out partakes of the character which affixes to all our dairy management, viz., a division of from 12 hours to 12 hours, and is consequently subjected to a similar divisional arrangement. Hence the feeding of the animals proceeds thus.

At 5 o'clock in the morning a portion of hay is shaken down before the cows; after this they are watered, and in the water purposely left in the troughs after they have quenched their thirst, chopped straw mingled with pollard (as mentioned above) is well stirred in; lastly, follows the feed of straw. On those farms where hay is fed thrice a day, the second hay feed is given after the chopped straw; but this intermediate hay feed is only given in localities where hay is unusually abundant.

As we esteem it essential that the cattle should be left in perfect repose during the operation of chewing the cud, the cow-house is always closed between 9 and 10 o'clock and left so until 1 o'clock, when the same routine of feeding recommences. At 5 o'clock in the evening the last and largest portion of straw is shaken down before the cows, and with this they must content themselves during the night.

Opinions are divided as to the species of corn most profitable for dairy stock; some farmers preferring Oats and others Barley for their milch cows. Oats, undeniably, effects the larger milk production; Barley gives more flesh, and thereby a more enduring milk-productiveness after the cows come on the pastures; Peas and Rye are likewise occasionally given, in conjunction with either Oats or Barley, but it is to be noted that, unless an unusually large quantity of hay can be afforded to the cows, Peas and Rye are apt to impart a strong taste to the butter. The species of grain most advantageous for himself or his dairy cattle must however be after all left to the selection of each individual farmer, for as I have never yet been able to find unanimity of opinion in favour of any one sort of grain, I have come to the conclusion that the varied qualities of soil, water, and other local circumstances, must contribute in no inconsiderable degree to determine the comparative advantage of one corn species over another as food for dairy cattle. *F. Greenwold.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A SPECIAL COUNCIL was held at the Society's House, in Hanover-square, on Wednesday last, the 20th of February, for the adjourned consideration of a communication from the Royal Commission for the Exhibition of the Works of Industry of all Nations in 1851, as connected with the general question of the most proper and convenient place for holding the Country Meeting of the Society in the same year: present, His Grace the Duke of RICHMOND, K.G., Trustee, in the Chair, Lord Hatherton, Hon. Robert Henry Clive, M.P., Hon. Capt. Dudley Pelham, R.N., M.P., Hon. H. W. Wilson, Baron Mertens, Sir Thomas Dyke Acland, Bart. M.P., Sir Charles Lemon, Bart. M.P., Sir John V. B. Johnstone, Bart. M.P., Mr. Raymond Barker, Mr. Bramston, M.P., Mr. Brandreth, Mr. French Burke, Colonel Challoner, Mr. Walbanke Childers, M.P., Mr. Evelyn Denison, M.P., Mr. Druce, Mr. Foley, M.P., Mr. Brandreth Gibbs, Mr. Grantham, Mr. Fisher Hobbs, Mr. Hudson of Castleacre, Mr. Jonas, Mr. Miles, M.P., Mr. Parkins, Mr. Pendarves, M.P., Mr. Pusey, M.P., Prof. Sewell, Mr. Shaw of London, Mr. Villiers Shelley, Mr. W. Simpson, Mr. Stansfield, MP., Mr. C. Hampden Turner, Prof. Way, and Mr. Wilson of Stowlangtoft.

The Secretary having laid before the Council the summons for the meeting, and the President's letter authorising its issue, as well as the communication from the Royal Commission laid before the Council, by Mr. Pusey, M.P., at their previous meeting, the Council received from Mr. Pusey a further communication from the Commission, in reply to enquiries for information, he was requested, as a member of the commission, to make on the part of the Council, and then proceeded to the mature consideration of the special business for which they had been summoned.

On the motion of Colonel Challoner, seconded by Mr. Evelyn Denison, M.P., it was resolved: "That the Royal Agricultural Society of England shall hold their Show of Cattle, under their own rules and regulations, in Kensington, in 1851; but that the Society will not hold a Show of Implements in that year."

On the motion of the Hon. Capt. Pelham, M.P., seconded by Mr. Childers, M.P., it was resolved: "That a Copy of the Resolution of the Council be communicated to the Royal Commission by Mr. Pusey, with the expression of the Council's willingness to confer further with the Commission, should they at any time desire it."

The Council then appointed a committee, consisting of the Duke of Richmond, Mr. Raymond Barker, Mr. Shelley, Colonel Challoner, Mr. Hudson of Castleacre, Mr. Jonas, Mr. Brandreth, and Mr. Shaw of London, to look over the Charter and Bye-laws of the Society, and take the necessary steps that may be required in consequence of the resolutions then agreed to by the Council.

Mr. Raymond Barker and Mr. Miles, M.P., gave notice that they should move, at the monthly council in April next, "That the order in council of 3d May, 1847, be rescinded, with a view to substitute for the counties therein named, the county of Middlesex, and that the successive years of the Exhibition be carried forward so as to maintain the rotation of districts as now constituted: namely—

1851.—*Metropolitan District*, comprising the county of Middlesex.

1852.—*South-Eastern District*, comprising the counties of Kent, Surrey, and Sussex.

1853.—*South Wales District*, comprising the whole of South Wales, with the addition of the counties of Monmouth, Gloucester, Hereford, and Worcester.

1854.—*East-Midland District*, comprising the counties of Leicester, Lincoln, Nottingham and Rutland.

THIBETIAN SHEEP.—His Royal Highness Prince Albert communicated to the Council, through the Hon. Colonel Phipps, a Report on Her Majesty's flock of Thibetian Sheep on the farm at Osborne, for which the Council directed their best thanks to be conveyed to his Royal Highness for the interesting details which it furnished, and for the assurance it implied of his Royal Highness's participation in the national objects of the Society. The Council directed this communication to be submitted for the consideration and discussion of their next weekly meeting on the 13th of March.

BELGIAN FIRE-PLACES.—The Secretary having informed the Council that the Belgian Fire-place, presented to the Society by their life-member, the Baron Mertens, of Oslin, in Belgium, and accepted by the House Committee, had been put up in one of the official rooms of the society, the Council offered their thanks to Baron Mertens, then present at the meeting, for this instance of his liberality and great attention to the Society. Baron Mertens then laid before the Council a work, by M. Jules Noirsain, on the construction and advantages of the new plan by which apartments could be aired and ventilated, in the most economical and agreeable manner, by means of this fire-place, which he hoped would prove, as he intended it should do, a great advantage to persons of every rank in England, but especially to the poorer classes. The Council directed this work to be received with their best thanks, and to be laid before the weekly Council on the 13th March, for the information of the members of the Society.

GUANO ADULTERATION.—Professor Way expressed his intention of making "Guano and its Adulteration," the subject of his Lecture, to be delivered before the Members, in the Council-room of the Society, on Wednesday, the 27th inst., at 12 o'clock, previously to his commencing the course of lectures, of which the arrangement was left to the Council at their next monthly meeting.

Notices to Correspondents.

A GARDEN FARM: *A Country Curate.* You had better no attempt anything beyond pigs and poultry, and the largest produce for both is to be obtained by growing Carrots, Mangold Wurzel, and Cabbages—buying bran and meal. You might begin to get up a stock of poultry pretty soon; but pigs need not be bought for some months; not, indeed, till you have a stock of Cabbages, &c., to feed them on. And probably the best plan will be to buy a sow in farrow, and afterwards to put her to the boar, in November and again in May; feeding the first litter up to bacon, and fattening the second as pork. The bulk of the garden which can be devoted to this purpose had better be divided into three equal parts, and sow one with Belgian Carrot seed; one, plant with Drumhead Cabbage plants, and the third sow with Globe Mangold seed. Shall we publish your letter? Paxton's "Cottager's Calendar" is the best book for you.

BURDENS ON LAND: *J R C.* Mr. Hoskyns has your note.

ESSEX BREED OF PIGS: *A Subscriber.* Fisher Hobbs, Esq., Boxted Lodge, Colchester.

FEEDING CATTLE: *X Y Z.* Procure full grown—say three years old short-horn oxen. Tie them up; unless you can give them a small yard or a box apiece.

GRASS SEEDS: *To Correspondents.* We shall be happy to answer inquiries regarding the right composition of mixtures for different circumstances; but beg to say, that they will in every case get these prescriptions properly prepared at the nearest respectable seedsman's. Or if they prefer dealing with firms of wider and more established reputation, let them consult our advertising columns for addresses.

GRASSES. Sow early in April, along with 1 bushel of Barley per acre, on a well harrowed soil, and bush harrow in, Aira cæspitosa *lutescens*, 1 lb.; Alopecurus pratensis, 2; Arrhenatherum avenaceum, 1½; Avena flavescens, 1 lb.; Dactylis glomerata, 2; Festuca duriuscula, 3; F. heterophylla, 1; F. loliacea, 1; F. pratensis, 2; Lolium italicum, 3; L. perenne, 5; Phleum pratense, 1; Poa nemoralis, 4; P. trivialis, 1½; Trifolium pratense *perenne*, 4; T. repens, 5; total, 38 lbs. per acre.

HYBRID PHEASANTS: *N F.* I beg to say that I have in several instances succeeded in obtaining a cross between the cock pheasant and common barn-door hen; and, if required, could give you the names of more than one gentleman in my neighbourhood who have been equally successful. Two hybrids of my own rearing I presented to Mr. C. Cobbold, for the Edinburgh Zoological Gardens. I have also hatched young ones from eggs between the gold pheasant and barn hen; but unfortunately did not rear them. *J Farr.*

INSURANCE: *B R.* We imagine not; but the thing is a matter more for the opinion of your lawyer than for determination by us.

Italian Rye-grass: *Anon.* Sow about 2 bushels per acre, on any light soil in good condition, over the young Wheat, just before the last hoeing you give it, and then hoeing will bury the seed. If not sown till the end of April (provided it be then done when the ground is damp), so much the better.

Mossy Pasture: *A M.* You had better drain, and apply wood-ashes at the rate of about two cart-loads per acre, and then fold sheep over it, giving them some Peas or other grain along with the Grass, during summer. That will be the cheapest way of getting the land in order.

Plans of Cottages: *A Subscriber.* They are published in the last number of the Journal of the English Agricultural Society.

Peruvian Barley: *Messrs. Lee and Son.* The following is the opinion of one who has studied Hordeum thoroughly. "The ear sent appears to answer with tolerable accuracy to the variety Hordeum gymno-hexastichon, or, as Lawson more properly calls it, Hordeum vulgare nudum, and commonly called four or six-rowed naked Barley, or Siberian Barley. Its similarity to Wheat in taste and flour is no proof of its being a new variety, for we find the Siberian naked Barley described in "Miller's Gardeners' Dictionary" as weighing 66 lbs. per bushel, and yielding 60.6 per cent. of flour equal to London "seconds;" 30 3 per cwt. of a coarser sort, and 9.1 per cent. of bran superior to that of Wheat. This flour made excellent bread, both by itself and when mixed with Wheaten flour, and more retentive of moisture than Wheaten bread. Two bushels of Siberian Barley were also malted, and made partly into ale, and partly into small beer, and both proved excellent. These experiments were made upwards of 80 years ago, so that unless the Messrs. Lee can substantiate better claims for their Peruvian Barley than merely being six-rowed, similar to Wheat in taste, and malting well, I fear it will share the fate of all the naked Barleys that have ever been tried in this country, and fall into oblivion, practically speaking."

Sheep on Turnips: *M P J.* The disease is evidently seated in the internal or mucous coat of the bowels, and the cause, though obscure, is probably connected with the food. Frozen Turnips is certainly a likely cause. We recommend a greater change of food, and the addition of Linseed or Linseed-cake. With regard to a remedy, the space of time between apparent illness and death is too short to be of much use, but we would recommend the following powder to be given in Linseed gruel twice a day: calomel, 1 gr; nitrate of potash, 1 scruple; tartarised antimony, 1 gr.; powdered opium, 1 gr. *W. C. S.*

Soot: *Timothy Clod.* Apply 20 to 30 bushels per acre, in wet weather, broadcast, in April, over young Wheat, Oats, Barley, or Grass.

Spade Husbandry: *A B* says, "My friend the carpenter informs me he is able to grow, by double culture, Beans at the rate of 10 coombs per acre, and Beet at 30 to 35 loads per acre. He has never tried Carrots." *T. R.*

Sulphur: *Ullswater.* The circumstance that any particular sort of atom is useful under certain circumstances of combination, is no proof of its being useful in any other state. The atoms of which prussic acid are made go to make the most wholesome food when otherwise arranged. And though sulphuric acid is useful with bones, you can draw no inference from that as to the usefulness of sulphur. In the practice of the farm, sulphur is of no use except in medicine.

Vetches: *Subscriber.* Sow Vetches now, they will be ready to eat off before August.

Markets.

COVENT GARDEN, Feb. 23.

Vegetables are plentiful, but many kinds of Fruit are scarce. Hothouse Grapes are over, and Pine-apples are anything but plentiful, as are also Pears and Apples. Filberts, Walnuts, and Chestnuts are abundant, and Oranges and Lemons are sufficient for the demand. Amongst Vegetables, Turnips and Carrots are good, and there is some fine Cornwall Broccoli in the market. Potatoes are unaltered since our last account; foreign ones fetch from 50s. to 70s. a ton. Lettuces and other salading are cheaper, and so are Mushrooms. French Beans, Asparagus, Seakale, and Rhubarb may be obtained at last week's prices. Cut Flowers consist of Heaths, Pelargoniums, Big-nonia venusta, Primulas, Camellias, Cinerarias, Christmas Roses, Azaleas, Lilacs, Lily of the Valley, Epacrises, Acacias, and Roses.

FRUITS.

Pine-apples, per lb., 6s to 9s	Almonds, per peck, 6s
Grapes, Portugal, p. lb., 9d to 1s	— sweet, per lb., 2s to 3s
Pears, per doz., 6s to 10s	Walnuts, p. 100, 1s 6d to 2s
Apples, kitchen, p. bsh., 4s to 6s	— p. bush., 16s to 24s
Lemons, per doz., 1s to 2s	Filberts, per 100 lbs., 60s to 65s
— per 100, 6s to 12s	Nuts, Bar., p. bush., 20s to 22s
Oranges, per doz., 9d to 1s 6d	— Brazil, p. bsh., 12s to 16s
Oranges, per 100, 5s to 12s	Kent Cobs, 65s to 75s p. 100 lbs

VEGETABLES.

French Beans, p. 100, 2s 6d to 3s	Carrots, per bun., 4d to 6d
Seakale, per punnet, 1s to 2s	Spinach p. sieve, 2s to 3s
Asparagus, p. bund., 1s 6d to 6s	Onions, p. bushel, 2s to 3s 6d
Rhubarb, p. bundle, 6d to 1s	— Spanish, p. doz., 1s 6d to 4s
Savoys, per doz., 6d to 9d	Shallots, per lb., 4d to 8d
Cauliflowers, p. doz., 1s to 4s	Garlic, per lb., 4d to 8d
Broccoli, p. doz. bundl., 8s to 12s	Lettuce, Cab., p. sc., 4d to 9d
Greens, per doz., 2s to 3s	Endive, per score, 1s 6d to 4s
Brussels Sprouts, p. hf. sieve, 1s 6d to 2s	Mushrooms, p. pot., 9d to 1s 3d
Sorrel, p. hf. sieve, 1s to 2s	Small Salads, per punnet, 2d to 3d
Potatoes, per ton, 60s to 120s	Watercress, p. 12 bun., 6d to 9d
— per cwt., 3s to 7s	Fennel, per bunch, 2d to 3d
— per bush., 2s 6d to 3s 6d	Savory, per bunch, 2d to 3d
Turnips, p. doz. bun., 1s 6d to 2s 6d	Thyme, per bunch, 2d to 3d
Red Beet, per doz., 9d to 1s	Parsley, p. doz. bun., 2s to 3s
Horse Radish, p. bdl., 1s to 4s	— Roots, p. bdle., 1s to 1s
Cucumbers, each, 3s to 5s	Marjoram, per bunch, 2d
Leeks, per bunch, 1d to 1½d	Mint, per bunch, 2d to 3d
Celery, p. bundle, 8d to 1s 6d	Corn Salad, p. hf. sieve, 9d to 1s

POTATOES.—Southwark, Feb. 18.

The Committee report that the arrivals from the Continent since our last report have been very limited, which is entirely owing to the boisterous weather; the supply coastwise and per rail is quite sufficient to prevent any improvement in price. The following are this day's quotations:—Yorkshire Regents, 90s. to 120s. per ton; Wisbeach do., 70s. to 100s.; Scotch do., 70s. to 80s.; Scotch cups, 65s. to 75s.; French whites, 70s. to 80s.; Belgian do., 70s. to 80s.

HOPS.—Friday, Feb. 22.

Messrs. Pattenden and Smith report that the market is steady and firm for the best class of Hops; the difference in price between new and yearling Hops is so great that buyers are turning their attention to the finest of the 1848's.

HAY.—Per Load of 36 Trusses.

Smithfield, Feb. 21.

Prime Meadow Hay	66s to 72s	Clover	60s to 80s
Inferior ditto	50 63	New Clover	— —
Rowen	50 60	Straw	23 27
New Hay	— —		J. Cooper.

Cumberland Market, Feb. 21.

Prime Meadow Hay	68s to 74s	Inferior	65s to 72s
Inferior ditto	55 63	New Clover	— —
New Hay	— —	Straw	25 30
Old Clover	80 86		Joshua Baker.

Whitechapel, Feb. 21.

Inferior ditto ...	50 55	Inferior ditto	60 65
New Hay	— —	Straw	22 26
Old Clover	80 85		

SMITHFIELD, Monday, Feb. 18.

We have a good supply of Beasts, both as regards numbers and quality. The fine morning, and a tolerable clearance at the dead markets, cause a rather large attendance of buyers, and 4s. is realised for some of the choicest Scots; this is, however, too much to quote as average of the best qualities. The supply of Sheep is again short, and prices have somewhat advanced; still the trade is slow, and higher rates very reluctantly given. Trade is by no means brisk for Calves, and 4s. 6d. is an extreme quotation. Pigs are still making low prices. From Holland and Germany we have 54 Beasts, 120 Sheep, and 50 Calves; from Scotland, 200 Beasts; from Norfolk and Suffolk, 1800; and 700 from the midland counties.

Beasts, 3362; Sheep and Lambs, 17,300; Calves, 104; Pigs, 204.

Friday, Feb. 22.

We have a considerable supply of Beasts, and the demand very limited. There is great difficulty in obtaining our highest quotations of Monday for the choicest descriptions, and many of inferior quality remain unsold. Sheep are more plentiful than of late; trade is heavy at about Monday's prices. Calves are in abundant supply, owing to large importations from abroad; prices have consequently fallen fully 6d. per 8 lbs. From Holland and Germany there are 290 Beasts and 165 Calves; from Spain, 29 Beasts; from France, 180 Sheep and 35 Calves; and 132 Milch Cows from the home counties.

Beasts, 977; Sheep and Lambs, 3390; Calves, 308; Pigs, 210.

MARK LANE.

Monday, Feb. 18.—The supply of English Wheat by land carriage samples to this morning's market was very small, and found ready buyers at an advance of 1s. per qr. Foreign was also in improved demand at former prices.—Barley, Beans, and Peas were each more easily disposed of at our quotations.—Excepting for fine qualities of old Oats, the sale is heavy.

Friday, Feb. 22.—With the exception of 7220 qrs. of foreign Wheat, almost entirely from Odessa, the arrivals of Corn during the week have been trifling. This morning's market was thinly attended, and business in all articles limited. We observe no alteration in the value of anything.—The Flour market is dull; French is held at 30s. to 35s. per sack.—Floating cargoes of Indian Corn can be purchased at 28s. per qr., but there is very little demand.—The value of Wheat during the past week has been firmly maintained throughout the kingdom, and in some instances a slight improvement realised. We observe no alteration in the price of spring corn. The Wheat trade in Dantzic and Rostock, though inactive, is not cheaper. In Konigsberg, Stettin, and some of the Pomeranian ports, continued dull accounts from this country have caused a decline of about 1s. per qr. In Hamburgh and Rotterdam prices are a shade higher, and fully supported in Antwerp. The French markets are dull, but not lower. In Odessa some purchases of Wheat have been effected on improved terms, equal to 32s. 6d. per qr., f.o.b., having been paid.

Liverpool, Tuesday, Feb. 19.—The imports this week are moderate of Oatmeal and Flour, but small of other articles from Ireland and coastwise. The general demand was again very languid at this morning's market. There seemed even less disposition to purchase Wheat and Flour, and prices remain nominally as quoted last Tuesday. Oatmeal 3d. to 6d. per load cheaper. As regards Oats, Barley, Beans, Peas, and Indian Corn, no change was noted in prices.

HARTLEY'S PATENT ROUGH PLATE GLASS.

In submitting our list of prices, we would beg to direct attention to the Leading Article of the *Gardeners' Chronicle* of Saturday, Dec. 8, upon the subject of "Patent Rough Plate." Some alteration having been made in the mode of manufacturing this description of Glass, the quality is greatly improved, and we now supply it perfectly flat, and, by an arrangement with Messrs. Hartley and Co., precisely at their prices. Cut to order in panes of

Wasp Traps.—Lists may be had, on application at the Warehouse, 87, Bishopsgate-street Without, same side as the Eastern Counties Railway.

FLEXIBLE INDIA-RUBBER HOSE PIPES.

JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING. These Pipes are well adapted for watering Gardens, conveying Liquid Manure, for Breweries, Gas Fittings, Chemical and all purposes where a perfectly sound Waterproof and Flexible Pipe is required. Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently flexible in all temperatures, and are therefore particularly suitable for Fire-Engines; and from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes. Being extremely portable, stowing closely without danger of injury, resisting the influence of climate, insects, and vermin, frequently so injurious to such articles on board ship, and retaining their virtues though long out of use, render them particularly adapted for exportation.

N.B.—VULCANISED INDIA-RUBBER GARDEN HOSE, fitted with Roses, Jets, and Branches, complete, with Union Joints, ready to attach to Water Cisterns.

All letters or Orders addressed to J. L. H. at the Manufactory and Warehouse, Goswell-mews, Goswell-road, London, will meet with immediate attention.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street.

SLATE WORKS, ISLEWORTH.—The following articles, manufactured in Slate for Horticultural purposes by Edward Beck, may be seen in use at Worton Cottage, upon application to the Gardener, Sundays excepted. Orange Tubs, Plant Boxes, Tanks, Cisterns, Shelves, Garden Path Edging, Hot Water Tank Covers, Flower-beds for Balconies, Shelves fitted to hold water for Orchidaceous Houses, &c.

Estimates given for Work as shown upon Drawings and in Specifications. A large stock of Slate Slabs, of all sizes and thicknesses, kept on sale.

Sales by Auction.

MESSRS. LODDIGES' CELEBRATED ARBORETUM FOR SALE BY AUCTION.
TO NOBLEMEN, GENTLEMEN, AND NURSERYMEN.

MR. J. C. STEVENS is favoured with instructions from Messrs. LODDIGES, of Hackney, to submit for unreserved competition, on the premises, on MONDAY, 4th March, and five following days, at 11 for 12 precisely, in consequence of the decease of the Senior Partner, the FIRST PORTION OF THEIR UNRIVALLED ARBORETUM, comprising many thousand well-grown specimens of the rarest and most beautiful Trees and Shrubs, affording to noblemen and gentlemen engaged in Ornamental Planting an opportunity which has never before occurred.—Catalogues are preparing, and will be ready for delivery 10 days prior to the sale, on the premises, and of Mr. J. C. STEVENS, 38, King-st., Covent-garden, London.

AMERICAN PLANTS.

MR. J. C. STEVENS begs to notify that two days of the Sale at Messrs. LODDIGES will be devoted entirely to the American Plants, which comprise Azaleas full of flower-buds and well adapted for forcing, Kalmias, Andromedas, Ledums, &c.

EAST INDIAN ORCHIDS OF THE GREATEST RARITY.

STEVENS is instructed to sell by Auction, at his Great Room, 38, King-street, Covent Garden, on TUESDAY, Feb. 26, at 12 for 1 o'clock precisely, an importation just received from CENTRAL INDIA, and well deserving the attention of Orchid growers, as it comprises a most remarkable new Cælogyne with erect panicles of flowers 3 inches in diameter, Cælogyne maculata also a new and beautiful species, C. cristata, C. Wallichiana, Dendrobium Farmerii (true), D. Devonianum, D. Gibsonii, D. Dalhousianum, D. Cambridgeanum, D. Griffithianum, and several new and distinct species of Dendrobium, a splendid new Cymbidium with erect flower stems 2 feet in length, and other novelties and rarities, in the finest order.—May be viewed on the morning of Sale and Catalogues had.

IMPORTANT SALE OF CAMELLIAS, ROSES, LILIUMS, &c.

MESSRS. PROTHEROE AND MORRIS will submit to public competition by Auction, at the Auction Mart, Bartholomew-lane, on THURSDAY, March 7, 1850, and following day, at 12 o'clock each day, about 600 Double Camellias, from 18 inches to 10 feet, beautifully furnished with bloom buds, 200 Strong Camellia Stocks, also 400 Standard and Dwarf Roses, consisting of Noisettes, Hybrids, Bourbons, Perpetuals, &c.; a fine collection of American Plants, comprising Ghent and other Azaleas, Andromeda Floribunda, Magnolias, &c.; 200 strong bulbs of Lilium Lancifolium Album, Speciosum, &c.—May be viewed the morning of Sale; Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

BROMPTON-PARK NURSERY, KENSINGTON.
TO NOBLEMEN, GENTLEMEN, NURSERYMEN, & Others.

MESSRS. PROTHEROE AND MORRIS have received instructions from Mr. John Sangster, and Mr. Robert Donald, trustees for the above estate, to submit to an unreserved sale by Auction, on the premises, Brompton-park Nursery, Kensington-road, Middlesex, on MONDAY, February 25th, and following days, at 11 o'clock each day, the whole of the remaining and valuable NURSERY STOCK, consisting of the well known celebrated collection of Standard, Dwarf, Maiden, and Trained Fruit Trees, and a rich assortment of Evergreens, Deciduous Shrubs, and Ornamental Trees; together with the Greenhouses, fitted up with new and improved Hot-water Apparatus, Pits, Frames, Carts, and Utensils; also a few Seeds.—May be viewed prior to the sale. Catalogues (1s. each, returnable to purchasers) may be had of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex. If sent by post, 1s. 6d. each.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, & Others.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions from Mr. John Smith, to submit to public competition by Auction, on the premises, Dalston Nursery, Middlesex, on MONDAY, March 11, and following day, at 11 o'clock (in consequence of the premises being required by the London and Birmingham West India Dock Junction Railway Company), the valuable NURSERY STOCK, consisting of a very superior assortment of large Evergreens, American Plants, Ornamental Trees, and Deciduous Shrubs, Fruit and Forest Trees in great variety, fine Ivies, Roses in pots, &c.—May be viewed prior to the sale. Catalogues may be had, 6d. each (returnable to purchasers), on the premises; the Shop, Covent-garden; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

CLAPHAM RISE.
TO GENTLEMEN, NURSERYMEN, FLORISTS, & OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, on the premises, Bedford Nursery, Bedford-road, Clapham Rise, on TUESDAY, March 5, at 11 o'clock, by order of Mr. Connolly, a portion of the valuable NURSERY STOCK, consisting of Evergreens and Deciduous Shrubs, also a choice collection of GREENHOUSE PLANTS, comprising fine Ericas, Camellias, Azalea Indica, Epacris, Chorozema, Boronia, Geraniums, Cinerarias, Acacias, Cactus, Genistas, Neriums, Intermediate Stocks, &c.—May be viewed one day prior to the Sale; Catalogues on the premises, of the principal Seedsmen in London, and of the Auctioneers, American Nursery, Leytonstone, Essex.

FRENCH HORTICULTURE.
RARE PLANTS JUST IMPORTED.

MESSRS. ROBINS will sell by Auction, at the Cosmorama, 209, Regent-street, on TUESDAY NEXT, at 11 for 12 o'clock, and unreservedly, by order of M. Jodoux, the importer, a Large Collection of Rare Plants, just imported from France, in the highest condition and most thriving state. They comprise Magnolia, Camellia, Cactus, Orchis, Pæony, Azalea, Rhododendrons, New Grafted Roses, Dwarf Orange Trees, Amaryllis, Bulbs, Fruit Trees, and Flower Seeds.—On view on Monday, at the Cosmorama Rooms, 209, Regent-street.

MR. HASLAM will sell by Auction, at the Auction Mart, on THURSDAY, Feb. 28, and FRIDAY, March 1, 1850, Camellias, Azaleas, Picotees, Carnations, Hyacinths in Pots; Weeping, Climbing, Standard, and Dwarf Roses; Herbaceous Plants, German Flower Seeds, &c.—Catalogues may be had at the Mart, and of the Auctioneer, South Essex Nurseries, Epping, Essex.

TO AGRICULTURAL MACHINE AND IMPLEMENT MAKERS, MILLWRIGHTS, AND OTHERS.

TO BE LET, by Private Contract, with possession at Lady-day next, an old established and well-connected BUSINESS of the above description, with an excellent Residence and extensive ranges of Shopping, a Seven-horse power Steam Engine, large Yard, and every convenience for carrying on an extensive trade. The situation of the property is in the midst of an agricultural district in South Staffordshire. The business has been carried on very successfully for the last 35 years; and the Proprietor, who is retiring, has very extensive connections in most of the surrounding counties. The stock of Timber, Tools, and Machinery may or may not be taken, at the option of the purchaser.—For further particulars, and to treat, application is requested to be made to Mr. THOMAS PAGE, House and Estate Agent, Darlington-street, Wolverhampton, Staffordshire.

AMERICAN PLANTS, STANDARD ROSES, ORNAMENTAL TREES, EVERGREENS, &c.

MR. D. A. RAMSAY has been favoured with instructions, from an eminent Firm, to sell by Auction, on the premises, Brompton Nursery, Fulham-road, Brompton, on MONDAY, March 11th, and following day, at 12 o'clock each day, without reserve, a further consignment of choice AMERICAN PLANTS, comprising 700 Rhododendrons, 2 to 4 feet, 200 Scarlet Rhododendrons, a quantity of Azaleas, Andromedas, Hardy Heaths, Sedum, &c.; a quantity of strong Grape Vines, Figs, Standard and Dwarf-trained Fruit Trees, a choice assortment of Clematis, Jasmine, and other Creepers, 500 Standard, Dwarf, and Climbing Roses, 5000 large Evergreens in variety, 3000 Limes, Acacia, Willow, Poplar, and other ornamental Trees, with a quantity of Deciduous Shrubs, and other Nursery Stock.—May be viewed three days prior to the Sale, and Catalogues had, 6d. each, returnable to purchasers, at the usual Seed Shops, and of the Auctioneer, Brompton Nursery, Fulham-road, Brompton.

CHELSEA.
TO GENTLEMEN, NURSERYMEN, BUILDERS, and Others.

MR. D. A. RAMSAY has been favoured with instructions from Messrs. Wm. Dennis and Co., to sell by Auction, on the premises, King's-road, Chelsea, opposite Cremorne Gardens, on MONDAY, February 25th, 1850, and two following days, at 12 o'clock, each without reserve (to clear the land taken for building purposes), a large portion of the NURSERY STOCK, comprising a quantity of Aucuba, Holly, Box, and other Evergreens; Mulberry trees of all sizes; the prize collection of Gooseberries; the new silver striped Ivy; large Irish Ivies; yellow Jasmine and other Creepers; a quantity of ornamental trees and shrubs; a choice collection of standard Plums and other Fruit trees, with a quantity of Moss Rose stools and layers, and other Roses in choice varieties; also a quantity of Camellias, Azaleas, Geraniums, Aloe, Yucca, &c.—May be viewed two days prior to the Sale, and Catalogues had (6d. each, returnable to purchasers) on the premises; at the principal Seed-shops; and of the Auctioneer, Brompton Nursery, Fulham-road, Brompton, London.

FOR PUBLIC SALE, on MONDAY, March 4, at the New Corn Exchange Tavern, Mark Lane, at 2 o'clock precisely, by Order of Messrs. ANTONY GIBBS and SONS, the Importers, about 250 Tons of damaged PERUVIAN GUANO, in warehouses, ex sundry ships.—Catalogues, and further particulars in due time, from L. A. RUCKER and BENCRAFT, Brokers, 26, Commercial Sale Rooms, Mincing-lane, London.

TO BE LET, for a term of years, on a CORN RENT, a FARM, in one of the Midland Counties, within two miles of a Market Town and Railway Station. It consists of about 200 acres, 18 of which are in Water Meadow, 28 in Pasture, and the remainder are excellent Turnip and Barley soil. The whole is of a first-rate quality. The Farm Buildings have been lately erected, are on a most complete and comprehensive plan, and are in excellent repair; and the Farm-house possesses every convenience and accommodation required by a respectable family. This Farm is in an excellent state of cultivation. All the interior hedge-rows and timber have been grubbed up; and the arable land is formed into four fields, divided by excellent roads. The Farm is, and has been for some time, under the 4-field system of cultivation. To a gentlemen possessing the requisite capital and ability, who can carry out a good system of agriculture, this Farm is well adapted. Entry at Lady-day

Apply to Mr. JOHN MORTON, Whitfield, Berkeley, Gloucestershire.

TO MARKET GARDENERS, FRUITERERS, ROOT GROWERS, AND OTHERS.

TO BE LET, with immediate possession, at Stratford, Essex, about 2¾ acres of MARKET GARDEN LAND, well stocked with Fruit Trees and Flower Roots, with small Greenhouse and Dwelling-house on the premises. Further particulars may be had on application to MR. R. GOLLEDGE, 5, Surinam-terrace, Stratford, Essex.

TURNIP AND BARLEY FARM.

TO BE LET, and entered on at Lady-day next, a desirable BARLEY and TURNIP FARM, in Gloucestershire, of about 160 acres, with a comfortable House for a small family, 30s. per acre and tithe free. About 50 acres more may be had. The South Wales Railway will pass through the Parish.—Apply by letter to Mr. WM. MIDDLETON, Post-office, Stamford, Lincolnshire.

TO BE LET, for a term of 7, 14, or 21 years, and entered upon immediately, NORTHFLEET GREEN FARM, situate in the parish of Northfleet, Kent, containing 136 acres (more or less) of superior, dry, Arable and Hop Land, with suitable Dwelling-house and Agricultural Buildings. The incoming tenant will enter without valuation.—For particulars apply to WALTER D. JONES, Esq., Lancyck, near Newcastle Emlyn, Wales; and, to view the Farm, to J. BRENCHLEY, Esq., Wombwell-hall, near Gravesend, Kent.

TO NURSERYMEN AND FLORISTS.

TO BE LET, a Newly erected HOUSE and SHOP, with Plate Glass Front, large Walled Garden, &c., near Battersea-bridge, the New Park, surrounded by an improving neighbourhood. The House is arranged for letting the upper part, consisting of five rooms, with private entrance. Sewers formed by the Commissioners. Abundant spring water. Rent, 55l.—Apply personally, before 2 daily, or, by letter, to Mr. SMEADON, 12, Sloane-square, Chelsea.

WANTED TO RENT, 20, 30, or 40 acres of Good Arable Land, a sandy loam, thoroughly drained, and near a town or railroad station. If a House and buildings thereon it would be preferred.—Address, prepaid, X.Y.Z., Post-office, Prestbury, near Cheltenham.

TO GENTLEMEN'S GARDENERS, FLORISTS, and Others.

TO BE DISPOSED OF, A SMALL NURSERY, in a capital situation near London, well adapted for a gentleman's gardener about commencing business. To be had with or without stock.—For terms, &c., apply to PROTHEROE and MORRIS, Leytonstone; or to ROBERT J. GREEN, 28, Cannon-street, City, London.

STALLIONS FOR SALE.—Two five-year-old Suffolk Stallions, the property of T. BEALE BROWNE, Esq., Hampen, Andoversford, Gloucestershire. One is 17 hands high, the other over 16. They are sure foal getters, and were much admired and highly commended by the Judges at the Royal Agricultural Society's Show at York.

Also two very fine five-year-old Suffolk Geldings.

CORN MANURE.

BLASHFIELD'S PATENT COPROS.—A new Manure for Corn and other Crops, prepared from the nitrogenous matter deposited on the banks of the Thames, in combination with other substances essential for the growth of corn, &c., price 8l. per ton. Sold, in a finely ground state, at No. 3, New London-street, Mark-lane; also, at the Works, Mill-wall, Poplar; Waterloo Dock, Lambeth; and No. 1, Praed-street, Paddington Basin.

PATENT COPROS, for Corn crops, also for Turnips, &c.; Superphosphate of Lime, Gypsum, calcined and saturated with liquid manure. CEMENT for Liquid Manure Tanks, Malt House Floors, and Barn-floors, manufactured by J. M. BLASHFIELD, successor to Wyatt Parker and Co., Original Patentees—Parker's Cement. Established 1786. Drain Pipes, Tiles, &c.

NEW REGISTERED GARDEN POT.

OLIVER AND CO. beg respectfully to announce to the nobility, their patrons, and the public, that their newly-invented Graduated FLOWER POTS, for perfecting the growth of plants, will be ready for delivery on the 1st of March. Specimens on view at 210, Regent-street (opposite Conduit-street), London.

SILVER SAND, PEAT, &c.—REMOVAL.

EDWARD KEMP begs to thank his numerous friends for their kind support during the last seven years, and informs them that he has removed to No. 16, Ann's-place, East-street, Old Kent-road, where he respectfully solicits a continuance of their favours.

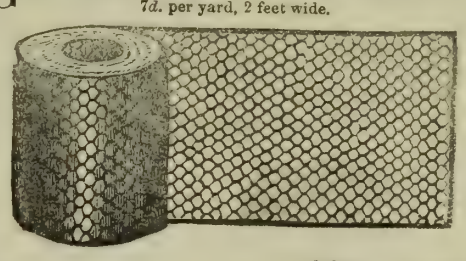
DR. NEWINGTON'S HAND-DRILL HOES, with their various fittings; Hand-Dibbles, with from 6 to 9 depositors each (as the Prize Dibble at Norwich), Wheel-Dibbles, Drop-drills, and Hand-sowing Implements for dropping seed at defined intervals in the seams of the plough, or in pressed land, or in drills. A Prospectus and Lecture on Seeding sent gratis on application to Messrs. DUFAIN and Co., Agricultural Depôt, 21, Red Lion-square, Holborn, London.

MR. EDWARD RYDE, LAND SURVEYOR, DRAINAGE and AGRICULTURAL ENGINEER, LAND AGENT, &c., will send free, on receipt of 14 postage stamps, "A READY RECKONER, with plain instructions for Measuring and Valuing Hay-ricks." Surveys, Maps, Sections, Specifications, and Estimates for Land Improvements. Agencies conducted by yearly contract. Estates sold or let.—Address, 14, Upper Belgrave-place, Eaton-square, London.

TO THE LOVERS OF FLOWERS.

COLES'S SOLUBLE COMPOUND ALKALINE POWDER.—Confidently offered as a most efficacious application for promoting the healthy growth and beauty of all kinds of HARDY OR TENDER PLANTS AND FLOWERS, requiring merely A SMALL TEASPOONFUL of it to be dissolved in every ENGLISH PINT OF WATER USED, and the solution to be applied occasionally, by means of a common rose watering-pan.

Sold, in GLASS BOTTLES of 1s. 6d., 2s., 2s. 6d., 3s. 6d., and 5s. each, by HENRY COLES, Seedsman, &c., 32, Cranbourn-street, Leicester-square, bearing his seal, signature, and address upon the corks and labels (without which none is genuine), of whom also may be had the celebrated



CARBONIZED ANIMAL MANURE,

prepared, in like manner, specially for FLOWERS, perfectly free from smell, to be used in a DRY STATE, and sold in TIN CANISTERS of 1s., 1s. 9d., and 2s. 6d. each, or COMPACT WOODEN BOXES of 5s., by taking which, a considerable saving in price is obtained.

Wholesale Orders for the above, and the same prepared in a LESS REFINED STATE for AGRICULTURAL PURPOSES, FRUITS, AND VEGETABLES, also punctually executed, to any extent, upon application to the MANAGER at the MANUFACTORY, Middle Yard, Great Queen Street, Lincoln's Inn Fields, where may be seen analyses of the various sorts, made by Professor WAY (analytical chemist to the Royal Agricultural Society of England), and other eminent authorities.

NEWS, NEWS, NEWS.—The best, cheapest, and largest Newspaper in the World.—LLOYD'S WEEKLY LONDON NEWSPAPER contains 60 large columns of the latest intelligence from all parts of the Globe, price only Threepence, postage free. Send Three Postage Stamps to E. LLOYD, 12, Salisbury-square, London, and receive one copy as a sample.

GALVANISED WIRE GAME NETTING.—7d. per yard, 2 feet wide.

		Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide	...	7d. per yd.	5d. per yd.
2-inch " strong "	...	9 "	6½ "
2-inch " extra strong "	...	12 "	9 "
1⅝-inch " light "	...	8 "	6 "
1⅝-inch " strong "	...	10 "	8 "
1⅝-inch " extra strong "	...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3d. per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

WIRE NETTING, ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

12 inches wide	3d. per yard	30 inches wide	7½d. per yard
18 " "	4½d. "	36 " "	9d. "
14 " "	6d. "	48 " "	1s. "

Galvanised do., 1d. per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1s. 6d. per running yard; if galvanised, 2s. Also every description of Wire Nursery and Fireguards, Wire House Lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1s. 10d. per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6d. per running foot; Flower Trainers, from 3d. each; Garden Arches, 20s. each; Flower Stands, from 3s. 9d. each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

SUPERB RANUNCULI.—The present being the usual month for planting, we beg to recommend the following. The new varieties have been selected with great care, of first rate sorts, from immense quantities of seedlings; and for vigorous growth and free flowering are far preferable to the older varieties. Se ections, in strong roots, at the following reasonable charges, with printed instructions for planting and treatment.

RANUNCULUS.—Free by post.	£	s.	d.
50 Splendid new varieties, with names	2	0	0
25 do. do.	1	2	0
50 Fine older varieties, do.	0	15	0
25 do. do.	0	8	0
100 Finest mixed	0	10	0
100 Fine mixed, 5s.; or free by post for	0	6	0

A Descriptive Catalogue of the seedling varieties may be had. Remittances are expected from unknown correspondents.

Bass and Brown, Seed and Horticultural Establishment, Sudbury, Suffolk.

SPLENDID DOUBLE RANUNCULUS ROOTS.

MR. SNELLING is commissioned to sell a few hundred roots of the above most beautiful flower, the property of an amateur grower. They are of a first class mixture, worth 20s. per 100, and may be had for 5s. per 100, at 28, New-road, Brighton. Sent carriage free for 6s. per 100, or 25 good roots for 18 postage stamps.

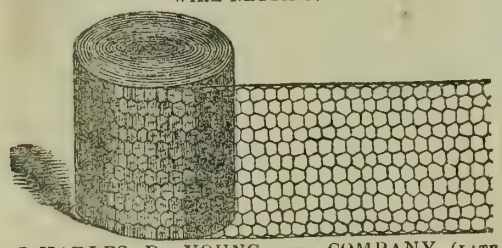
Choice Flower Seeds, 18 packets, various, for 18 postage stamps.—Robert Snelling, 28, New-road, Brighton.

JOHN RIVERS, Seedsman, Sawbridgeworth, Herts, begs to offer the following superior productive POTATOES:

2d Early.—Soden's Early Oxford .. .. per bushel	6s.	6d.
Do. Fox's Seedling .. .. .. ,,	6	6
Do. Shaw's Early .. .. .. ,,	4	6
Late, very superior bearers, and very late keepers ,,	5	0

Carriage paid to London. Post-office orders are requested from unknown correspondents.

RENÉ LANGELIER, St. Helier, Jersey, begs to state that he has still several thousand CAMELLIA STOCKS to dispose of, at from 40s. to 50s. per 100, all fit for immediate grafting, and well established, so that they can travel without the pots, well packed in boxes. Also several thousands of that fine GLADIOLUS "CARDINALIS," large flowering bulbs, at 5s. per 100; it is well known to be perfectly hardy out of doors. Also very large bulbs of AMARYLLIS LONGIFOLIA, also perfectly hardy and blooming; large trusses, very sweet-scented; 2s. 6d. each.



REWARD.—ALEXANDER RUSSELL, a Gentleman's Gardener. The said Alexander Russell is a native of Scotland, and was a few years back living with E. Brande, Esq., of Turnham-green; then with Lord Lonsdale, of Barnes, Surrey; recently with Mr. Lumley, of "The Chancellor's," Hammersmith. Any person giving information as to his present residence (if living), or as to the time and place of his burial (if dead), will be handsomely rewarded, by addressing T. G., at Mrs. Burgess's, the Castle Inn, Child's Hill, near Hendon, Middlesex.

EASTERN COUNTIES RAILWAY.—WANTED, about 75 loads of Meadow HAY of the best quality, free from mould, dust, and outsides; also 75 loads of good CLOVER, to be delivered at any of the Company's Stations within 30 miles of London. Samples to be sent to the Storekeeper at Stratford, and sealed tenders (for the whole quantity or for part) marked on the outside "Tenders for Hay," to be addressed to the undersigned not later than the 28th inst.

(By Order) C. P. Roney, Secretary.

Bishopsgate Station, Feb. 23.

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG and COMPANY (late W. and C. YOUNG),

MANUFACTURERS OF IRON AND WIRE WORK, &c., 22, Parliament-street, Westminster, London; Castle-Buildings, Derby-square, Liverpool; 128, High-street, Edinburgh; and 32, St. Enoch-square, Glasgow, beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

Prices.—18 ins. high, 9d.; 24 ins., 1s.; 30 ins., 1s. 3d.; and 36 ins., 1s. 6d. per lineal yard.

Or a web of 100 yards, 18 ins. wide, will cost ..	£3	15	0
Do. of 100 yards, 24 ins. wide	5	0	0
Do. of 100 yards, 30 ins. wide	6	5	0
Do. of 100 yards, 36 ins. wide	7	10	0

If more or less than a web is required, it would be charged at the same rate per yard.

This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. Young and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1s. is equal to 2¼ yards of another article in the market, the same width, at 9d. per yard. Samples for inspection sent free of expense.

C. D. Young & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland.

"Familiar in their Mouths as HOUSEHOLD WORDS."

Shakespeare.

On Saturday, March 30, will be Published, Price 2d., or stamped for post, 3d.,
(Also in Monthly Parts,)

No. I. of

HOUSEHOLD WORDS.

A Weekly Journal,

DESIGNED FOR THE INSTRUCTION AND ENTERTAINMENT OF ALL CLASSES OF READERS.

CONDUCTED BY CHARLES DICKENS.

London: Published at the Office, 16, Wellington-street North (where all Communications to the Editor must be addressed); and Sold by all Booksellers and Newsmen.

NEW WORK ON GARDENING AND BOTANY.

On the 1st of March will be published, price 2s. 6d., No. 1. of

PAXTON'S FLOWER GARDEN.

EDITED BY DR. LINDLEY AND JOSEPH PAXTON.

AND ILLUSTRATED BY HIGHLY FINISHED PLATES AND WOODCUTS.

This Work, for which Monsieur Constans, a French Botanical Draughtsman of great taste and skill, and a pupil of Mons. Decaisne, has been expressly engaged, will be confined to the proper business of an illustrated book, namely the representation and description of all new plants which may appear in gardens. The species which are of most importance will be illustrated by coloured plates, one species or genus only to a plate, with a leaf or more of letter-press, explaining the principal scientific and horticultural facts which belong to each plant. The species of less importance will be treated of more briefly, and will be illustrated when necessary by copious woodcuts and vignettes. The object, in short, will be to combine Scientific Botany with Gardening, and exact delineations of plants with pictorial effect. It is believed that by such means this periodical will not only be indispensable to the Botanist and Gardener, but be also a mine of invaluable hints by which the Artist and Manufacturer will be able to profit.

It is not intended to admit any other kind of matter than such as is now described. All special treatises on cultivation, and all disquisitions respecting subjects incidental to gardening, will be transferred to the *Gardeners' Chronicle* and similar periodicals, in which there is ample space for such discussions, and to which they have now become better adapted than to a pictorial work.

London: Bradbury and Evans, 11, Bouverie-street.

THE LADIES' COMPANION AT HOME AND ABROAD, Edited by Mrs. Loudon. Part II. will be published on the 28th instant, price Fourteen Pence.

London: Bradbury and Evans, 11, Bouverie-street, and sold by all Booksellers and Newsmen.

London: Groombridge and Sons, 5, Paternoster-row.

In fcp. 8vo, with Plates and Woodcuts, price 7s. 6d. cloth,

MISS ACTON'S MODERN COOKERY-BOOK. For the use of Private Families. The Ninth Edition, with Directions for Carving, and other Additions and Improvements.

"The whole of Miss Acton's recipes, 'with a few trifling exceptions, which are scrupulously specified, are confined to such as may be perfectly depended on, from having been proved beneath our own roof, and under our own personal inspection.' We add, moreover, that the recipes are all reasonable, and never in any instance extravagant. They do not bid us sacrifice ten pounds of excellent meat, that we may get a couple of quarts of gravy from it; nor do they deal with butter and eggs as if they cost nothing. Miss Acton's book is a good book in every way; there is right-mindedness in every page of it, as well as thorough knowledge and experience of the subject she handles."—*Medical Gazette.*

London: Longman, Brown, Green, and Longmans.

LOUDON'S ENCYCLOPÆDIA OF AGRICULTURE.

The Fifth Edition, with Supplement, in One very thick Volume, 8vo, with nearly 1300 Woodcuts, price 50s. cloth,

SAFFRON WALDEN.
SUPERB COLLECTION OF DOUBLE HOLLYHOCKS.

WILLIAM CHATER has a large and healthy stock of his unequalled collection of this splendid flower, and can supply good strong plants that will bloom well next autumn. For particulars, see printed Catalogue, which may be had on application by enclosing a postage stamp. Plants warranted true to name. A remittance requested on delivery of plants.
Post-office orders to be made payable at Saffron Walden.

PELARGONIUMS AND NEW PLANTS, MANY OF THEM FROM CALIFORNIA AND CHINA.

H. GROOM, Clapham Rise, near London, by Appointment FLORIST TO HER MAJESTY THE QUEEN, and to HIS MAJESTY THE KING OF SAXONY, begs to say that his CATALOGUE OF PELARGONIUMS AND NEW PLANTS is ready, and will be forwarded by post on application.

VERBENA—"WONDERFUL."

G. MOORE begs to refer the readers of this Paper to his Advertisement of the 2d ult.
Perry Barr, near Birmingham, March 2.

THE WHOLE COLLECTION OF PLANTS BELONGING TO THE LATE QUEEN DOWAGER.

THE subscribers having purchased, by private contract, the whole of the above Collection of magnificent Plants, respectfully solicit the attention and inspection of noblemen, gentlemen, and amateurs furnishing Conservatories, Greenhouses, Pineries, Forcing-houses, &c., the present being an opportunity that rarely occurs of giving immediate effect at little cost. The Stock comprises many splendid Camellias, from 3 to 8 feet high ; Orange trees, 4 to 10 feet ; Scarlet Tree Rhododendrons, 3 to 9 feet ; clean Fruiting and Succession Pines, Large Vines and Figs in pots fit for immediate forcing, about 1200 strong Strawberries in pots for present forcing, fine American Aloes, &c. Also
THE WHOLE OF THE GARDEN MOVEABLES ; comprising Ornamental Seats and Tables in great variety, large and small Rollers, Hand-Glasses, &c. This great addition to the immense Stock of Plants previously held by the subscribers being more than they can accommodate, must be immediately sold. Any information as to price and size may be obtained (stating quantity required), by addressing THOMAS JACKSON and SON, Nurserymen, Kingston, Surrey.

NATURAL GRASS SEEDS FOR PERMANENT PASTURES, AND IRRIGATED CATCH MEADOW.
Which may be had Separate or Mixed, expressly to suit the soil.

MESSRS. JOHN SUTTON AND SONS having for many years paid especial attention to the examination of Natural Pastures, in the various soils of England and Wales, are enabled to supply the sorts and quantities of Seeds best adapted to suit the soil for which they are intended ; and *at much less expense* than is usually incurred. Any information required by post will be promptly attended to.
SUTTON'S RENOVATING MIXTURE, consisting solely of the finest and most nutritious Perennial Grasses and Clovers, will be found highly useful if sown early on old pastures which are become destitute of the best kinds of Grasses. Quantity required per acre, 6 to 8 lbs. Price, 1*s.* per lb. Also,
FINEST LAWN GRASSES, entirely free from everything but the finest and shortest growing kinds, price 1*s.* 3*d.* per lb., 3*s.* per gallon, or 21*s.* per bushel.
N.B. Carriage free by Great Western, South Western, or South Eastern Railways.
Also Ashcroft, Liverpool, and other Swedes, White Belgian and other Carrots, Yellow Globe and other Mangolds, True Italian Rye-grass, Drumhead Cow Cabbage, Kohl Rabi, &c., of home growth.
Reading Seed Warehouse, Reading, Berks.

A BEAUTIFUL ORNAMENT FOR THE DRAWING-ROOM.
Send 24 penny postage stamps to

JOHN REID, Mount Scilla Nursery, near Chippenham, Wilts, and in return you will receive 12 Roots of DOUBLE LILY OF THE VALLEY, post free, to any part of the United Kingdom. The graceful habit and delicate appearance of the above Flower render it equally suitable for the Suburban Villa and the Nobleman's Parterre ; while the delicious perfume it possesses will make it indispensable in the Lady's Posy and the Drawing-room Bouquet.

BROMHAM-HALL GREEN-FLESH MELON IS THE FINEST FLAVOURED IN THE WORLD.

EDWARD TILEY having become possessed of the whole stock of Seed of that very superior MELON called "BROMHAM-HALL GREEN-FLESH MELON," he is now sending out good sound Seeds at 2*s.* 6*d.* per packet of 6 seeds ; larger do. of 15 seeds, 5*s.* per packet. THOMAS RIVERS, Nurseries, Sawbridgeworth, Herts.

SELECT FLOWER & KITCHEN GARDEN SEEDS,
ESPECIALLY RECOMMENDED BY THE
WRITER OF THE CALENDAR IN THE GARDENERS' CHRONICLE OF FEB. 9th, PAGE 86.

JOHN SUTTON AND SONS, *possessing all the kinds of Seeds* so strongly recommended in the *Gardeners' Chronicle*, page 86, can supply them at low prices, particulars of which appeared in the 1st page of the *Chronicle* for Feb. 16. They can also supply Dr. LINDLEY's selection of the best six sorts of Peas, as stated in their Advertisement, in the 3d page of the *Chronicle*, of Feb. 9th; and most of the above sorts are included in MESSRS. SUTTON'S COMPLETE COLLECTIONS OF KITCHEN GARDEN SEEDS, now in course of delivery, at the under-mentioned Prices, Carriage free.

No. 1, *2l.* *2s.* No. 2, *1l.* *1s.* No. 3, 12*s.* 6*d.*

Reading Seed Warehouse, Reading, Berks.

KITLEY'S GOLIAH STRAWBERRY.

JAMES KITLEY, in again bringing his SEEDLING STRAWBERRY before the notice of the Public, takes this opportunity of thanking those Friends who so liberally purchased in the autumn, and it being now the best time for planting, begs to inform them that he has a fine stock of healthy plants, which have been transplanted. See extracts from the *Gardeners' Chronicle*.

From the *Gardeners' Chronicle*.—"STRAWBERRIES: *J. K.* Your Seedling Strawberry, 'Goliah,' judging from its size and appearance, is worthy of cultivation."

From the Gardeners and Farmers' Journal.—"STRAWBERRIES: *J. K.*, *Lyncombe Vale*. We have great pleasure in bearing testimony to the exquisite flavour of your Seedling Strawberry, 'Goliah.' In our opinion it combines the piquant flavour of the Strawberry with the richness of the Pine, the delicious aroma of which it partakes in equal proportion with the taste. Apart from the queen of fruits, we certainly do not remember anything in this way that conveyed to our senses so delicious a treat as the noble fruit to be known to the world as 'Kitley's Goliah Strawberry.'"

Plants, 12*s.* per doz., or 4*l.* per 100. A liberal allowance to the Trade in plants, when 100 are taken.

Cash orders expected from unknown correspondents.

Lyncombe Vale Nursery, Bath, March 2.

FINE SPECIMENS OF

ARAUCARIA IMBRICATA, 2 feet to 2 feet 6 ins., 10*s.* each.

CEDRUS DEODARA, 1½ to 2 feet, 24*s.* per dozen.

The above are in pots and raised from seed, and will be supplied on liberal terms, when a quantity is ordered. A list of various sizes may be had on application.

"TIGRIDIA CONCHIFLORA."

A beautiful hardy bulbous plant, producing, in long succession, large lemon-coloured flowers, spotted with crimson, and is well adapted for bedding. Strong flowering roots 6*s.* per dozen, or per post, free, 7*s.* per dozen.

30 packets of new and very choice Flower Seeds for 6*s.* per post, free.—YOUELL and Co., Nursery, Great Yarmouth.

EARLY TEN-WEEK POTATO, the earliest grown, will beat the Ash-leaved Kidneys by ten days—per bushel, 14*s.*; per peck, 4*s.*, bags included. Pure Stocks of ASH-LEAVED KIDNEYS, RED DITTO, BARHAM'S WALNUT-LEAVED, SHAWS, REGENTS, FORTY-FOLD, &c., at moderate prices.

Twelve of the newest and rarest Flower Seeds:

Nemophila maculata	Martynia angularis
Brachycoma, splendid hybrids	Portulaca Thorburnii (yellow)
Phlox Drummondii alba	,, alba striata
,, oculata	Podolepsis chrysanthemoides
,, Leopoldina	Schizanthus retusus alba
Martynia fragrans	Ipomœa Burridgii

One packet each 10*s.* 6*d.*

GERMAN STOCKS, from 2*s.* per collection.
,, ASTERS, from 3*s.* ,,
,, CARNATIONS, 2*s.* 6*d.* per 100.

DUNCAN HAIRS, 109, St. Martin's-lane, Charing-cross, London.

SAMUEL FINNEY AND CO.'S NEW CATALOGUE OF SEEDS is now ready, and will be forwarded gratis on the receipt of two penny stamps for postage. In forming our Collections of Seeds we have taken special care to include all the select and most approved kinds, and such as we can confidently recommend.

Of VEGETABLE SEEDS, our Collections contain a full supply of all that is requisite for the largest establishment, and the kinds and quantities for each collection are stated. No. 1, 2*l.* 10*s.*; No. 2, 1*l.* 10*s.*; No. 3, 1*l.*; and No. 4, 12*s* 6*d.*

Of FLOWER SEEDS, we have included all the most choice and showy kinds, particularly those we know to succeed well in the north, and a full list of all the best kinds of German Seeds, imported direct in sealed packets, with prices.

A Collection of 100 packets of the best hardy and half-hardy kinds for ... ... 15*s.* 0*d.*
Ditto of 50 ditto ditto ditto ... 8 0
Ditto of 25 ditto ditto ditto ... 5 0

We particularly recommend this Catalogue to residents in the north, as they will be enabled to purchase to advantage. All orders delivered free of carriage at any of the railway stations between Newcastle and York, Berwick and Carlisle, and by steam-boat to London, Hull, Whitby, Leith, Dundee, and Aberdeen. Railway and water communication to all parts of the kingdom.

SAMUEL FINNEY and Co., Gateshead, near Newcastle-on-Tyne

NEW SEEDLING PANSIES, &c.

HENRY MAJOR, Knosthorpe, Leeds, begs to announce that he has ready for sending out healthy plants of his Five beautiful Seedling PANSIES, a valuable acquisition to this lovely family; viz.—

MADAME SONTAG.— Upper petals rich puce; lower ones broadly belted with the same; centre straw; blotch fine and very distinct; size, usual; flower smooth.

*BLUE-EYED MAID.—A correspondent of the "Florist" for February, in speaking of this flower, says, "This is an excellent flower, and a decided beat on Hall's Rainbow, and more constant; in fact, it is showable all the season. It is indispensable as a self in any collection."

MAGNIFICENT. — Upper petals bluish lilac; lower ones broadly belted with the same; centre white; blotch very large and solid; size large; petals of great substance; flower smooth.

HEBE.—Upper petals red bronze; lower ones belted with the same; centre deep yellow; blotch good; size usual.

SIR J. FRANKLIN.—Upper petals bronzy purple; lower ones broadly belted with the same; centre rich yellow; blotch fine; size usual.

The set of Five for 1*l.*, post free.

* Plants of "Blue-eyed Maid" may be had separately at 5*s.* each, or four plants for 15*s.*, post free.

The following 20 fine Show Pansies, including "Blue-eyed Maid," for 25*s.*, post free: Indispensable, Jullien, William Henry, Sultan, Hector, Enterprise, Snowdrop, Milton, and Blue-eyed Maid (Major's), Canary, Cracker, Duke of Norfolk, Supreme, Negro, Alpha, Satirist, Superb, Androcles, Ariel, and Disraelii.

Select Calceolaria and Pansy Seed 2*s.* 6*d.* per packet.

H. M. will have ready the first week in May, his Ten beautiful new shrubby Calceolarias, price 40*s.* the set. Also Twelve very good Calceolarias, including four or five seedlings not yet let out, 25*s.* A descriptive Catalogue of Calceolarias and Pansies may be had on prepaid application.

From unknown correspondents, a remittance is respectfully requested with the order.

SEEDS.

PETER LAWSON AND SON'S LIST.—Nos. 5, 6, and 7, for 1850, are now ready, and may be had on application, or will be sent free of postage to any part of the United Kingdom or British Colonies.

AGRICULTURAL SEEDS.—No. 5 contains a Priced List of Seeds for the Farm, with the kinds, quantities, and prices of Grass Seeds for sowing down land to Pasture, and for fine Lawns and Bowling Greens.

FLOWER SEEDS.—No. 6 contains a List of Flower Seeds, annual, biennial, and perennial, for cultivation in the open ground, in frames, in conservatories, and hothouses.

ROSES.—No. 7 contains a Descriptive List of Roses, distinguishing those suitable for different soils and situations, with short notices as to their habit of growth and method of cultivation.

FOREST AND FRUIT TREES.—No. 2 contains a Priced List of Forest, Fruit, and Ornamental Trees, seedling and transplanted, suited for the climate of the United Kingdom, including also Plants for Hedging and Underwood.

GARDEN SEEDS.—Priced Lists may be had on application.

PETER LAWSON and SON, Nurserymen and Seedsmen to the Highland and Agricultural Society of Scotland, have appointed as their Agent in London, Mr. J. C. SOMMERS, 159, Fenchurch-street, who will afford every information as to supplies of Forest Trees, and Garden or Agricultural Seeds.

*** There are ready and economical means of transit from Edinburgh, by steam or railway, to all parts of England and Ireland.—George the Fourth Bridge, Edinburgh, March 2.

CARNATIONS, PICOTEES, AND PINKS. — March being the best month for planting the above beautiful Flowers, JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester, respectfully informs gentlemen, &c., that he is sending out fine varieties at the following low prices:

25 pair of Carnations, in 25 varieties ... ... 20*s.*
25 pair of Picotees, in 25 do. ... ... 20*s.*
25 pair of Pinks, in 25 do. ... ... 8*s.*

Hamper, &c., included. Catalogues on application.
Post-office orders to be made payable at Manchester.

PROVIDENCE NURSERY, RAMSGATE.
(Late WM. MILLER.)

JAMES TURRELL having taken the above Business, lately conducted by Mr. J. G. HINE, he strongly recommends the following first-class PELARGONIUMS:

*VICTORIA, Improved.—This will prove a beautiful bedding variety; colour the same as the old Victoria, only brighter and improved in shape. Price 5*s.*

NEW SEEDLING PELARGONIUMS.

*ATTRACTION.—Large bold crimson scarlet flower, with white centre; free flowering variety, of fine habit.

SUNSET.—Fine rich scarlet, with broad under petals; very fine form, rather weak habit; a great improvement on scarlet Defiance.

ROSA ALBA.— This variety is very attractive, lower petals rose, with large white centre; upper petals dark rose, with fine dark spot.

KENTISH BEAUTY.—Pale pink, of very fine form, and free bloomer.

AURORA'S FLAG.—This flower is of extra size, novel and attractive colours, very bright; this flower is much after the style of Aurora.

BEAUTY OF THANET.— Lower petals, delicate pink; upper petals, black; of fine form.

*EXACTUM.—Pure white lower petals; upper petals crimson purple, with a fine margin of white. This flower is a perfect model, and was admired by all who saw it.

*MAJESTICA. — Superb dark purple flower, very round, equal to the best blooms of Distinctus; very true and free bloomer, of fine dwarf habit.

The set of Eight for 3*l.* 3*s.* Usual allowance to the Trade.

Those marked * have obtained First Class Certificates.

J. T. would also recommend the following, all of which will be found among the best of last season: Brilliant, Magnum Bonum, Childe Harold, Venusta, Ave Maria, Triumph, Nobilissima, Rodolphus (extra), Surprise, and Delight. The Ten for 30*s.*

Cash to accompany all orders from unknown correspondents. Post-office orders to be made payable to the name of JAMES TURRELL.

NEW AND STRIKING VERBENA.

ARTHUR MACKIE begs to offer the undermentioned to the attention of Florists, with the fullest conviction that it will give entire satisfaction.

WOODSTOCK'S MAGNIFICENT.—A. M. having purchased the entire Stock of this unrivalled Verbena, offers it to the Public with the utmost confidence, being fully persuaded that it will surpass everything yet out in its class. The individual flowers cover a sixpence, and sometimes a shilling. It is of a very free habit and growth, and well suited for grouping. See *Gardeners' Chronicle*, Sept. 15, 1849.—"*W. K. B.* Colour bright rose, fading to pink; a remarkably fine variety, with much the largest flowers we have yet seen."

Fine strong plants the 1st of April, at 5*s.* each, free by post. Where three are ordered four will be sent.

MACKIE'S Descriptive Catalogue of Flower and Vegetable Seeds is now ready, and will be forwarded on receipt of two stamps for postage.—Norwich Nursery, Norwich, March 2.

NOTICE.—The Partnership formerly carried on by JOHN ADAMS and ROBERT HOGG as Nursery and Seedsmen, at Brompton-park, Kensington-road, London, under the name of GRAY, ADAMS, and HOGG, was dissolved on the 21st day of April last, by mutual consent. (Signed)

WILLIAM CHAMBERS, witness. JOHN ADAMS.
THOMAS WESTCAR, witness. ROBERT HOGG.

In reference to the above, JOHN ADAMS begs to return his sincere thanks to his Friends and the Nursery Trade generally for the kind and liberal support he has received for a long period of years, during his connection with the Brompton-park Nursery, and to inform them that he has purchased the greater portion of the Stock, consisting of the extensive collection of Fruit Trees, &c. And as he intends carrying on the Business as formerly, on his own account, he hopes to receive a continuance of those favours he has so long enjoyed, and which he will always endeavour to merit.

Brompton-park, Kensington-road, March 2.

FRUIT TREES, FLOWER-BEDS, &c.—Garden Netting, of superior quality, for preserving Fruit trees from frost, blight, and birds, or as a fence for rabbits, fowls, pigeons, Tulip and Seed beds, can be had in any length or quantity at 3*d.* per yard 2 yards wide, or 6*d.* per yard 4 yards wide, from JOHN KING FARLOWS, Fishing Rod and Net Manufactory, 5, Crooked-lane, London-bridge. The netting being tanned will stand exposure to the weather for many years. Forwarded to any part of the kingdom on receipt of post-office order, or reference in town. An allowance to gardeners and large consumers.—Copy the Address, 5, Crooked-lane, London-bridge.

JOHN BAILY, PURVEYOR TO HER MAJESTY AND H.R.H. PRINCE ALBERT, 113, Mount-street, Grosvenor-square, London, Dealer in every description of Useful and Ornamental POULTRY and WATER-FOWL. Dorking, Hambro', Spanish, Polish, and Cochin China Fowls. Gold and Silver Spangled Bantams. All sorts of Pea Fowls. Gold, Silver, Pied, and Ring-necked Pheasants. Tame-bred Pheasants in any numbers. Live Partridges for turning out.—Priced Lists and Estimates forwarded by post, on application.

BECK'S PELARGONIUMS, AND OTHER RAISERS' PRODUCTIONS.

The Selections advertised at Two Guineas are all sold.

Of the varieties 1847 and 1848, enumerated in E. BECK's Catalogue (to be had in exchange for one postage stamp) a good assortment remains. The varieties intended for sending out next autumn in the two guinea selection are now propagating, and will be ready in September, enabling purchasers to grow them on, and to make good plants for the following year.

N. B. The latter selection will be distinct and good.

Worton Cottage, Isleworth, March 2.

NEW AND ESTEEMED FRUITS, which ought to be in every collection.

The above are all hardy varieties, and bear well as Standards or Pyramids. Of those marked thus *, dwarf trained trees can be supplied at 3*s.* 6*d.* each.

THE LARGE FRUITED MONTHLY RASPBERRY.

Fruit of this fine autumnal bearing Raspberry were exhibited at the meeting of the Horticultural Society, November 6th, and obtained a Certificate of Merit. Like other Raspberries, it will not give a full crop of fruit the first season after planting, but requires to be established one year, after which it will bear most abundantly from August to November. Canes 9*s.* per dozen; or 60*s.* per 100.

Belle d'Orleans, a new and fine very early Cherry, 3*s.* 6*d.* each. Carriage paid to London.

THOMAS RIVERS, The Nurseries, Sawbridgeworth, Herts.

KITCHEN GARDEN AND FLOWER SEEDS.

JOHN CATTELL, NURSERYMAN and SEEDSMAN, Westerham, Kent, begs to offer to the public a few very choice SEEDS, which may be had free by post at the prices annexed.

KITCHEN GARDEN SEEDS.

	per packet.—*s.* *d.*
Beet, Cattell's Dwarf Purple-top... 0	6
Broccoli, Elletson's April White 1	0
,, Wilcove Superb White 1	0
,, Chappell's Cream ... 0	6
,, Jones's Superior White 0	6
Cauliflower, Dwarf Late Walcheren ... 1	0
Cabbage, Cattell's Reliance 1	0
An improved early dwarf, in quality equal to his well known "Barnes," and may, like that, be sown the middle of July without fear of running to seed the following spring; it is particularly hardy, and being suitable for all seasons, may be depended on for being the earliest and best Cabbage known.	
Cabbage, Cattell's Green Colewort 0	6
,, Do., Dwarf Barnes 0	6
,, Do., Nonpareil ... 0	6
Savoy, Dwarf Drumhead 0	6
Scotch Kale, fine feathered 0	6
,, Dwarf curled ... 0	6
Celery, Cole's Superb Red 1	0
,, Red solid 0	6
,, Seymour's Superb White 0	6
Cucumber, Sion House ,, Do., Improved ... ,, Manchester Prize ,, Man of Kent ... ,, Bath Victory ... ,, Roman Emperor ,, Carpenter's Wonder ,, Warwickshire Hero ,, Cuthill's Blk. Spine	1*s.* per doz. seeds
Melon, Bromham-hall, 6 seeds 2	6
Lettuce, fine black seed Green Cos ... 0	6
,, Do., Brown Bath Cos 0	6
,, Marseilles (handsome Cabbage) ... 0	6

Parsnip, Guernsey, fine large hollow-crowned... 0	6

FLOWER SEEDS.

Ipomœa Burridgii, splendid red variety of Convolvulus major 1	0
,, purpurea splendens, or new dark Convolvulus major ... 0	6
Ipomopsis elegans ... 1	0
Portulaca alba striata ... 1	0
,, Thorburnii 1	0
Pentstemon speciosum ... 1	0
Do., per half-ounce 7	6
Rhodanthe Manglesii ... 1	0
Coreopsis nigra speciosa, fine... 0	6
Nemophila maculata ... 1	0
Phlox Drummondii alba, true 1	0
Jacobæa, extra fine, dble. purple 0	6
Indian Pink, extra fine ... 1	0
,, ,, fine fringed 0	6
Calceolaria, from first-rate sorts, impregnated ... 2	6
Stock, red Intermediate; this is the best Stock for early spring flowering; more than two-thirds come double ... 0	6
Primula sinensis, extra fine fringed, red and white mixed 1	0
Larkspur, dwarf double Rocket, extra fine mixed 0	6

J. C. begs also to offer as usual fine strong plants of his true and improved sorts of Early and Cattle Cabbage, price, including package, 4*s.* 6*d.* per 1000, carriage paid to the Edenbridge station, South Eastern Railway. A Post-office order or postage stamps to accompany all orders from unknown correspondents.

HAYTHORN'S HEXAGON GARDEN NET.—Noblemen, Clergymen, and Gentlemen who have Gardens or Hothouses, are respectfully invited to transmit their address to Mr. J. W. HAYTHORN, 4, Clinton-street, Nottingham, who will forward free, by post, particulars and patterns of his HEXAGON GARDEN NET, the best and cheapest article, highly approved, and now generally used for the protection of bloom, fruit, and flowers, from frosts, birds, wasps, flies, children, and servants, and also for placing on Hothouses, effectually keeping out birds and insects, without preventing the admission of light and air. Parcels are sent, carriage paid, to London, Liverpool, Bristol, Newcastle, Hull, &c., and intermediate stations.

WHITE BELGIAN CARROT, 70*s.* per cwt., 9*d.* per lb.
YELLOW GLOBE and LONG RED MANGOLD WURZEL, 70*s.* per cwt., 9*d.* per lb.
CATTLE and HOLLOW-CROWNED PARSNIP, 60*s.* per cwt. 8*d.* per lb.
SKIRVING'S IMPROVED PURPLE-TOP SWEDE, 28*s.* per bushel, 9*d.* per lb.
GRASSES, for Permanent Pasture, 20*s.* per acre.
Fine selected LAWN GRASS, 1*s.* 2*d.* per lb., and all other Agricultural and Horticultural Seeds equally low.
The above Seeds have been grown from some of the finest stocks in the country, and may be depended on as new and genuine.—WM. JAS. EPPS, Seed Merchant, Maidstone, Kent.

UNIVERSAL CATALOGUE OF VERBENAS, FUCHSIAS, DAHLIAS, CHRYSANTHEMUMS, PETUNIAS, &c.
G. SMITH'S Priced and Descriptive Catalogue contains the very best selections of the above; with a useful note and a marked List of the best Verbenas for exhibition in pots, with mode of training, and what is of great importance to exhibitors, the time of stopping back, so as to catch a sheet of bloom when it may be required; with descriptions of his superb Seedling Fuchsias, Verbenas, Petunias, &c.; and will be forwarded on the receipt of one postage stamp.—Tollington Nursery, Hornsey, Islington.

RENDLE'S TRUE WILLCOVE BROCCOLI.—*This superior variety has been proved by thousands to be the best late sort in cultivation, and can be recommended with much confidence. We have saved a small quantity this season on our own grounds, from some of the finest heads ever seen; price* 1*s. per packet, free by post.*
*** Twenty packets to the Trade for 12*s.*, or 50 for 2*l.* 10*s.* It will give the most complete satisfaction.
Our commercial stamp is on each packet.
COLE'S SUPERB RED CELERY, 1*s.* per packet.
Apply to WILLIAM E. RENDLE and Co.,
Seed Merchants, Plymouth.

SUPERB RANUNCULI.—The present being the usual month for planting, we beg to recommend the following. The new varieties have been selected with great care, of first rate sorts, from immense quantities of seedlings; and for vigorous growth and free flowering are far preferable to the older varieties. Selections, in strong roots, at the following reasonable charges, with printed instructions for planting and treatment.

RANUNCULUS.—Free by post.	£	s.	d.
50 Splendid new varieties, with names	2	0	0
25 do. do. do.	1	2	0
50 Fine older varieties, do.	0	15	0
25 do. do.	0	8	0
100 Finest mixed	0	10	0
100 Fine mixed, 5*s.*; or free by post for	0	6	0

A Descriptive Catalogue of the seedling varieties may be had. Remittances are expected from unknown correspondents.
BASS and BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk.

EARLY MARROW CABBAGE.—THE BEST IN CULTIVATION.
EDWARD TILEY can confidently recommend the following first-rate varieties as the best in cultivation.
Early Marrow Cabbage, sold in packets 2*s.* 6*d.* per oz.; or half-ounce packets at 1*s.* 6*d.*
True Walcheren Cauliflower Broccoli, 1*s.* per packet; Willcove do., 1*s.* per packet; Tamworth do., 1*s.* per packet.
Coles' Superb Celery, from Mr. Coles, Dartford, 1*s.* p. packet.
The original true Bath Cos Lettuce Seed, 1*s.* per packet.
Antirrhinum Seed, saved from 24 of the best varieties in cultivation, 1*s.* per packet.
Sweet-William Seed, saved from extra fine semi-double varieties, 1*s.* per packet.
The whole or any part of the above will be sent postage and package free.
Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 16, Pulteney Bridge, Bath. A remittance must accompany the order, either in cash or penny postage stamps.

CEDRUS DEODARA OR HIMALAYA CEDAR.—The Subscribers beg to inform the admirers and planters of the above hardy Tree, that they have upwards of FIFTY THOUSAND, from one to five years old, in pots, grown from seed, constantly in the open ground, which they are now supplying on such terms as will induce their general introduction into all plantations, being of rapid growth, highly ornamental, and of great value as a Timber tree.
WM. MAULE and SONS, Stapleton-road Nurseries, Bristol.

RHODODENDRON PONTICUM FOR UNDER COVER, &c.
JOHN WATERER begs to state he has large quantities of the above, which is now universally acknowledged the best Evergreen for such purposes, being free from attacks of hares and rabbits. Strong plants, fit for immediate planting, 10*s.* 6*d.*, 15*s.*, to 21*s.* per 100.
Descriptive Catalogues of his well known collection of American Plants, &c., to be had on application.
American Nursery, Bagshot, Surrey.

PANSIES, &c.
JOHN SCHOFIELD AND SON are prepared to send out the following set of 24 fine Show PANSIES for 1*l.* 1*s.*, viz.: Duke of Norfolk, Purple Standard, Caroline, Cracker, Blue Fringe, Milton, Paren, Jullien, Indispensable, Canary, Negro, Mrs. Bragg, Disraeli, Duchess of Norfolk, Perfection, Constellation, Zabdi, Candidate, Cypreus, Cossack, Supreme, Androcles, Alpha, Charmer. Post free.
A large stock of older varieties, 6*s.* per dozen.
J. S. and Sons have a few pairs left of their fine seedling PICOTEE, "MISS HOWARD." It was shown at the West Riding Central Floral Society Show, when a committee of seven was appointed to test the merits of the Seedling specimens, and to recommend such only as were worthy of being sold out, viz., Messrs. Smith, Dobbings, Stephenson, Oxley, Grey, Bramma, and Mansley. It was also submitted to Mr. Wood, in 1848; vide "Midland Florist," No. 21, under the letters J. S.: "12; an excellent light purple edge, good pod, broad and well-formed petals, crowns well; one of the most promising we have seen this season."
A fine healthy stock of the best varieties out, of Carnations, Picotees, and Pinks, 9*s.* to 20*s.* per dozen pairs. Dahlias, Verbenas, and Fuchsias, 3*s.* to 12*s.* per dozen.
Also a full descriptive Catalogue; and a few packets of very select Pansy and Calceolaria Seed, 2*s.* 6*d.* per packet. A remittance is respectfully solicited from unknown correspondents.
Knowsthrope, near Leeds, Yorkshire.

SEEDS.—A few select Seeds from the original raisers, which have now for several years given such general satisfaction to those who have grown them, viz.:
Elletson's (true) large Mammoth or April White Broccoli.
Elletson's (true) improved Wilcove White Broccoli.
Lindsay's imperial crimson Dwarf Beet.
Usher's "Exquisite" Curled Parsley.
Metcalfe's improved Dwarf Walcheren Broccoli.
Telford's superb early Dwarf Cabbage.
The above may be had at 1*s.* each, or the six sorts for 5*s.*, in Post-office order or postage stamps, on application to WILLIAM MAY, Hope Nurseries, Bedale, Yorkshire. W. M. begs to refer to former *Chronicles* for his Advertisements of select Pansy, Cineraria, Antirrhinum, and Hollyhock Seeds; also to his superb collection of hardy Herbaceous Plants, Hollyhocks, &c.

HORTICULTURAL SOCIETY OF LONDON.—The attention of the Fellows and their friends is invited to some remarkable specimens of the following three Plants now in Flower in the Society's Garden, viz.: Lælia superbiens, Dendrobium speciosum, and Phalænopsis amabilis.

EXHIBITIONS OF MELONS.
EDWARD TILEY begs to inform the Public that he will give a PRIZE of One Guinea for the best flavoured BROMHAM HALL MELON exhibited at the Chiswick Exhibition in July; and One Guinea for the best flavoured Bromham Hall Melon exhibited at the Regent's Park Exhibition in July. The money will be paid to the Committee before the exhibition. The above will prove to be the best Melon ever yet sent out. Sold in packets, seven seeds, 2*s.* 6*d.*, by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 16, Pulteney-bridge, Bath.
A remittance must accompany the order, either in cash or penny postage stamps to the amount.

ORANGE, LEMON, LIME, CITRON, AND SHADDOCK TREES.—The first importation of the above Trees, in most excellent and healthy condition, has arrived from Italy. They are from 2 to 4 feet high in the stems, very straight, and possess strong grafts, and will make splendid trees in two or three years; from 12*s.* to 25*s.* each. They may be seen at A. CORBETT'S Italian and Foreign Warehouse, 18, Pall-mall, London. Also Catalonian, Azorian, and Arabian Jessamine Plants. The Double Italian Tuberose Roots are still on sale, 4*s.* per dozen.

SEEDS IN COLLECTIONS.
OF THE BEST WHICH CAN BE PROCURED.
BASS AND BROWN beg to offer the following CHOICE VEGETABLE SEEDS.
Complete Collections of the best and newest sorts, in proportionate quantities of each, suited for large or small gardens, at per collection, 1*l.*, 2*l.*, and 3*l.* A Collection for a small garden, of good sorts, at 10*s.* 6*d.* A List of the Collections furnished if required.

SELECT AND CHOICE FLOWER SEEDS,
Free by post, with full directions for sowing, heights, colours, &c.

	s.	d.
100 varieties best and newest Annuals	15	0
50 varieties for 8*s.* 6*d.*, 30 for 5*s.* 6*d.*, 20 for	4	0
20 varieties best dwarf kinds, in larger packets, suited for filling beds on lawns, 7*s.* 6*d.*, or 12 do. for ...	5	0
20 varieties best Greenhouse Annuals, 7*s.* 6*d.*, 12 for ...	5	0
20 varieties choice Greenhouse Perennials, 10*s.* 6*d.*, 12 for	7	6
20 vars. choice hardy Biennials and Perennials, 7*s.* 6*d.*, 12 for	5	0
36 varieties imported German Stocks	5	0
20 ditto ditto, 3*s.* 6*d.*, 12 for	2	6

Remittances with orders are requested from unknown correspondents. Goods carriage free to London, and with all orders of 2*l.* and upwards, articles presented extra. Post-office orders payable to BASS and BROWN or to STEPHEN BROWN.
Our Descriptive Priced Seed and Plant List will be forwarded, prepaid, on application, by forwarding four postage stamps, as copies having the Newspaper stamp are now all distributed.
SEED AND HORTICULTURAL ESTABLISHMENT, SUDBURY, SUFFOLK.

DR. LINDLEY will be greatly obliged to those correspondents of the Horticultural Society who propose to contribute to the next Number of the "Journal of the Society" if they will favour him with their papers in the course of a few days.

"I DON'T know how it is, but our PEACHES somehow never *will* STONE. We have always a beautiful bloom, but the fruit won't hold on. In course it's no fault of ours; we can't do more than get the trees to bloom and set; after that it's the constitution of the things that's in fault; that old JOB wore them out, with his heavy crops. Well, we can't help that."

Thus soliloquised a little horticultural WE, upon seeing the ruin of his crop of forced Peaches for the fourth time. He had succeeded an old-fashioned gardener who was no great scholar, and talked little of the reason why he did anything. What he had been taught to do he did, and as he had been taught to do it. Not that JOB wanted observation; on the contrary, he was a good physiologist in his way, although unenlightened by LIEBIG and HLUBEK; he watched the natural processes which he beheld around him, and he applied them, as well as he could, to the artificial circumstances of his garden. He saw that Nature never advances too fast, and is never too slow; but that she works silently, constantly, and without procrastination; so he, too, in humble and reverent imitation, worked silently and constantly, never putting off till to-morrow what could possibly be performed to-day. The old man troubled nobody, and nothing troubled him. He abused no neighbour, and listened to no gossip; if he found a man a tale-bearer and slanderer he turned him off, for, as he used to say, "an evil tongue covers a lying heart." If his flues cracked, he stopped the joints with mortar; if his glass was broken, he patched it as well as he could till the glazier came; if he ran short of stable litter for his "linings," because the family was away, he made shift with leaves. "'Tan't so good as it might be, master," he used to say, "but *we'll make it do.*" He thought his master's interest the same as his own; he obeyed orders whether he liked them or not, and without grumbling, for he knew that to be his duty, and he had an old-fashioned way of doing his duty. Poor good, old JOB TILTH! as he was born and bred, so he died in the same good old family, and was buried in the same old churchyard where his father laid before him.

It was to such a man as this that our clever friend succeeded. He was a *particularly* clever young man, and had a reason for everything; the only disadvantage was, that he sometimes forgot to what the reason belonged. He knew the Latin names of plants, especially of common ones, and was thought quite a botanist, till an acquaintance one day caught him calling Lovage Angelica. He had studied so much, and learned so much, that he felt above being taught any more; and he particularly despised the opinions of the quiet country gentlemen who sometimes looked over his master's garden. "Don't you think, Mr. SPRIGGINS," said a visitor who was famous for the excellence of his gardener, "don't you think you are keeping this Vinery too hot and close, now that the Vines are in flower?" "Too hot, sir! *we* think it rather too cold. When *we* were in the Vineries at Browston Wick, *we* always kept them much hotter." In short, the constant use of the plural in speaking of himself was a true index of his great qualities; he had as much experience as any two men, as much skill as any dozen, and therefore, as he represented several in his own person, it was impossible that he should belong to the singular number. "I" would not express the concentration which existed in him; if he was but one in person, he was many in spirit, and therefore "WE" was the proper word to use.

When he took in hand the Peach house in question, Mr. SPRIGGINS complained of the glass, which was small, and cracked, and patched, and here and there let in the rain. The glass was mended, but the fruit dropped without stoning, and for the first time for many years there was no crop. He then found that the house was out of repair; that the wall plate was rotten, and the rafters full of old cracks that had never been puttied up; and he also found that there had been strong frosts in March when his Peaches were in flower; so the place was repaired, and nicely stopped and painted; still ill-luck attended him; the Peaches dropped just the same, and there was no crop. At last, however, the real root of the mischief was found in the bad old flues, which were cracked, and let out smoke, and one night burst. It was necessary that hot water pipes should be immediately substituted: and the good-natured master complied. It was amazing the quantity of soot found in those flues! no wonder that they burst and spoiled the crop. Old JOB had always *seen* them cleaned: but a person of Mr. SPRIGGINS' genius was above that; he had told one of the men to look after it, and the man had looked after his dinner instead, which was natural. However the hot-water pipes were fixed; Messrs. BRIGHT, MASON, and STOKER'S best new boilers were employed, and this time all was sure to go right.

However, as we have seen, somehow or other, everything still went wrong, and Mr. SPRIGGINS was now inclined to condemn the old trees that old JOB had worked in the old houses for so many years; he thought it would be better to get some new ones for the houses with new glass, new woodwork, and new hot-water pipes. His master also came to the conclusion that novelty had not been carried far enough, and that, under all these circumstances, a new gardener would be advisable. So Mr. SPRIGGINS was promoted to another place——when he could find one.

Mr. SPRIGGINS (he always expected to be called Mister) was fond of saying "it is for man to subdue Nature;" he believed, like other vain and ignorant persons, in the potency of human skill, and thought he had only to command and be obeyed. One cannot wonder at the fate of such a horticultural CANUTE. Had he adopted old JOB'S rational maxim that "it is for man to obey Nature," he would have been nearer the truth.

JOB knew that Peach trees are slow, very slow, in getting ready their bloom; that they have many a cold night and chilly day to bear between the first swelling and the opening of their flowers. Mr. SPRIGGINS was always in a hurry, for he was always behind-hand; so he gave his trees plenty of heat, and coddled them nicely, and forced them hard, and got their flowers open in half the time that JOB required. Then JOB knew that the Peach flower is a long time open, and very slow in setting, and that a little cold air in the day does it no harm, provided it is dry—quite the contrary; and so he took his time

about it—for ready JOB had always plenty of time. Mr. SPRIGGINS, on the contrary, never had time to spare; and he still forced hard, and shut his trees up close, and on no account allowed them to be chilled: and thus far he beat JOB hollow. JOB knew that trees out of doors, when the setting is over, are a long time about getting ready for stoning: he had seen that their fruit stalks grow stiff and stout, and the wood that feeds them and joins them to the branch gets pretty firm, and he had watched with his own eyes how by slow degrees the tiny threads that bind the stone to the pulp grew larger, and branch day by day till all is safe; and so he never hurried his trees. But the great Mr. SPRIGGINS said that setting was setting, that he had got all right as soon as that was done; and on he went with his fires, and his close house, and his warm nights. JOB had heard that the slow movements of Nature were in part to give time for the earth to warm, and the roots to draw well by the time that the swelling fruit wanted plenty of sap. Mr. SPRIGGINS, who had been told this, enquired with a learned air wether the ovarium grew on the branch or on the root? he begged to know what the ovulum wanted more than to receive the influence of the pollen tubes? and he expressed his total disbelief in JOB's theory of roots. As for roots "drawing," as it was called, he presumed that allusion was made to "endosmotic action, which was needless for such points as the ovarium. Such fancies might do very well for the last generation, but are beneath OUR contemplation." Nevertheless, as we have seen, JOB's fruit set, and Mr. SPRIGGINS' didn't.

The truth was, that JOB TILTH was a philosopher in the garb of a "practical," while Mr. SPRIGGINS was a practical who shammed the philosopher.

IN another column will be found an announcement that three remarkable plants, now in flower in the Horticultural Society's Garden, deserve the attention of the Fellows and their friends. The following are the particulars of their dimensions:

LÆLIA SUPERBIENS has 9 flower-stems upwards of 6 feet long, with clusters of flowers varying from 8 to 14 on each; the total number of flowers on the 9 stems is 90; the plant measures upwards of 6 feet across.

DENDROBIUM SPECIOSUM has 18 flower-spikes, from 18 to 20 inches in length, and with from 80 to 100 flowers on each; the plant measures nearly 6 feet across, with leaves from 9 to 12 inches long and 3 inches broad.

PHALÆNOPSIS AMABILIS has upwards of 40 of its large white flowers now expanded.

It is superfluous to add that these are plants which have been many years in the Society's possession. The first and last were, in fact, gigantic specimens when imported.

WE must spare a little room for the purpose of drawing attention to the announcement, in another column, that the whole of Mr. LODDIGES' extensive Arboretum will be sold by auction next week. This has long been celebrated as the largest collection of hardy trees and shrubs in any nursery. The sale will extend over a week, and affords a great opportunity for buyers to avail themselves of.

Upon running the eye over the catalogue we find the number of lots in Acer to be 58, of Æsculus 51, of Alnus 42, of Betula 50, of Viburnum 66, of Azalea 218, and so on. We should also add, that this has the reputation of being one of the most correctly named collections in Europe.

VILLA AND SUBURBAN GARDENING.

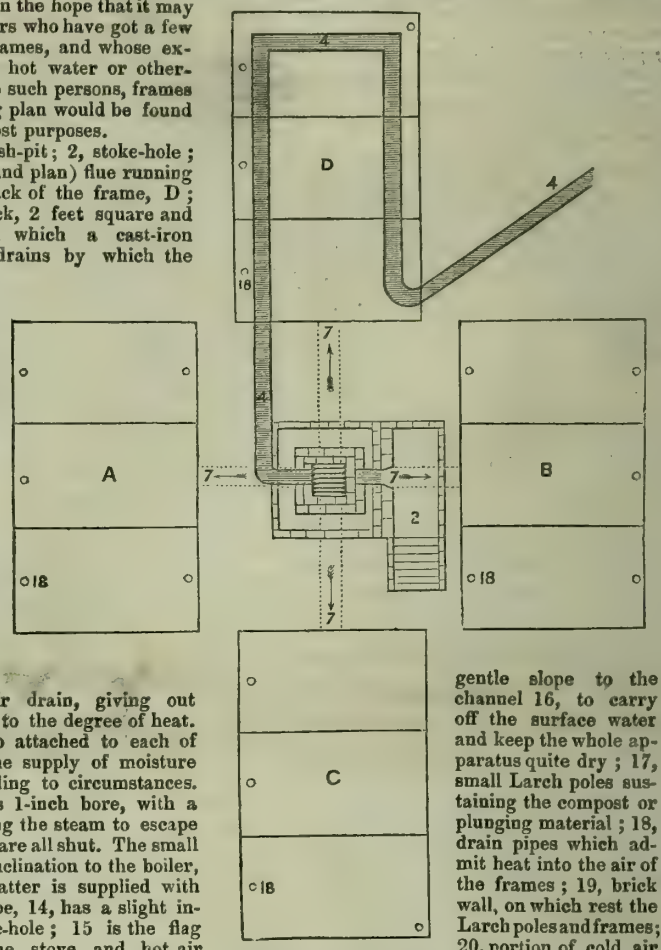
HOVEA CELSI is perhaps one of the most beautiful plants we possess either for the greenhouse or the conservatory; but its habit of growth has hitherto stood in the way of its general cultivation. The difficulty appears to consist in keeping it near the pot in the form of a low bush. The great proportion of the specimens we see are either tied to a wire-frame, or distorted round stakes. Now, the plant is an erect growing shrub, and not a climbing or trailing one. Shrubs take different forms, and I am of opinion that all the skill that could be brought to bear upon Hovea Celsii, could not produce it in the form of a beehive. Nor is this desirable; cultivators have run into extremes in this particular, and have infringed every rule of nature and good taste, in training all their plants in hemispherical forms. As the Lombardy Poplar, together with the Oak and the Cedar, constitute a combination, in a park, much more effective and pleasing to the eye of taste than the Oak would of itself, so on an exhibition stage, or in a greenhouse or conservatory, the natural forms of plants would be more imposing and gratifying to men of judgment than if they all appeared as if cast in one mould. The hedgehog appearances which characterise what has been misnamed high cultivation, is one of the extremes into which men are likely to fall when emerging from the leggy pot-bound system of the old school. I, however, do not recommend a retrograde system of culture; but I should like to see some respect paid to the natural habit and character which has been distinctly given to all vegetable life. Let art and skill be brought into the field to develope natural forms aright, but not to distort them, and we shall see the unsightly stakes and trellises that are now misapplied, vanish from our greenhouses.

An "Amateur" complains that he cannot grow his Hovea Celsi in the form of a Primula. He will learn from the above, that such a shape for this fine shrub is neither natural nor desirable.

The soil best adapted for Hoveas is three parts fibry peat, one part mellow turfy loam, and a sixth part of the whole silver sand; these should be well mixed together before they are used. This compost will be found to suit the majority of New Holland plants. Hovea Celsi has a strong tendency to run up, and consequently to become naked at the bottom, therefore it should be carefully watched when the plant is very young, and the shoots pinched back frequently, or, in fact, at every second joint. It is difficult to get it to make more than one shoot at a time, owing to its tendency to break only at the leading eye; but perseverance will, in some measure, overcome this evil, if the plant is making vigorous root. It should be trained in the form of an irregular cone, and no more than one prop should be used.

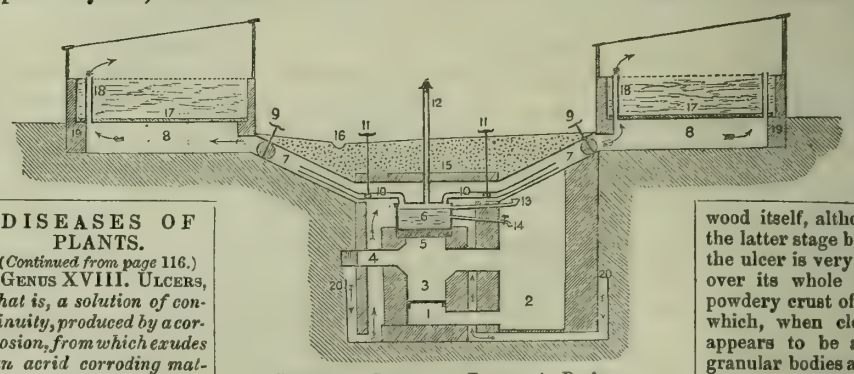
This Hovea does not require very liberal potting, and the operation should be performed when the flowers die off, for at that period its growth commences. Any directions respecting the application of water can scarcely be given; but there is one important point to be attended to, and that is, to keep it rather dry during winter; when the flowers begin to expand in spring, be more liberal in the supply. The roots are apt to rot if kept wet in winter, consequently, it is one of those plants which must have at least an inch of drainage in the bottom of the pot.

In my next, I shall discuss the subject of potting more at length. *Pharo.*



PLAN OF HEATING FRAMES AT CASTLE MALGWYN.

I BEG to send you the accompanying plan, by which top and bottom heat are obtained for four frames with one stove, in the hope that it may prove useful to amateurs who have got a few Cucumber or Melon frames, and whose extent of pits heated by hot water or otherwise is but limited. To such persons, frames heated on the following plan would be found very convenient for most purposes.



In section, 1 is the ash-pit; 2, stoke-hole; 3, furnace; 4, (in ground plan) flue running along the front and back of the frame, D; 5, (in section) fire brick, 2 feet square and 2½ inches thick, on which a cast-iron boiler (6) rests; 7, drains by which the hot air passes through from the stove into the chambers (8); three of these drains are formed with brick, the fourth, or one over the stoke-hole, is of cast iron; each drain is supplied with a damper, 9, to regulate or exclude the heated air.

The boiler has a moveable cover, to which are attached four cast-iron pipes (10), of 2 inches bore; one of these pipes is placed within each, and rests on the bottom of the hot-air drain, giving out moisture in proportion to the degree of heat. A damper (11) is also attached to each of these pipes, so that the supply of moisture can be adjusted according to circumstances. The waste pipe (12) is 1-inch bore, with a moveable cope, allowing the steam to escape when the dampers (11) are all shut. The small pipe, 13, has a slight inclination to the boiler, and through it the latter is supplied with water. The waste pipe, 14, has a slight inclination to the stoke-hole; 15 is the flag stone covering in the stove and hot-air chamber.

The space above the flag stone is levelled up with dry sand, and concreted over with a gentle slope to the channel 16, to carry off the surface water and keep the whole apparatus quite dry; 17, small Larch poles sustaining the compost or plunging material; 18, drain pipes which admit heat into the air of the frames; 19, brick wall, on which rest the Larch poles and frames; 20, portion of cold air drains, of which there are four, one from each frame. *W. Hutchison.*

GROUND PLAN OF STOVE, SHOWING THE POSITION OF FRAMES, A, B, C, D.

SECTION OF STOVE AND FRAMES A, B, &c.

DISEASES OF PLANTS.

(*Continued from page* 116.)

GENUS XVIII. ULCERS, *that is, a solution of continuity, produced by a corrosion, from which exudes an acrid corroding matter.* — This disease is in most instances the consequence of others, and it would be difficult, if not impossible, to show that it has not been produced either by checked perspiration, by laceration, amputation, or some other wound. As, however, it declares itself in trees growing with great vigour, and showing no distinct indications of any previous injury; and as it is also observed in poor localities on trees otherwise well conditioned, I have inserted it in the present class. I have been unwilling to increase the divisions of my Nosology, otherwise I might have established a distinct class of diseases the results of other diseases, amongst which ulcers would have had a place.

First species. INTERNAL ULCERS.—The internal ulcer invades at the same time not only the layers of bark but also the woody tissue. It is common in several plants, especially in those which are pruned immoderately. The Orange tree, which it is the custom to cut down to a symmetrical shape, is very subject to it. It shows itself generally by a whitish blotch on the stem, which soon turns black, and when the bark becomes disorganised, exudes the corroding humour. Fruit trees, especially Walnut trees, allowed to be ruined by injudicious amputations, or by the manner in which the fruit is gathered, without any care in pruning afterwards, are far more liable to ulcers than any other.

In the Apple tree the disease has been examined with great care. It generally shows itself at the origin of the roots, in the form of a rather large round black spot. The bark then begins to rot, and there runs out from it a humour, which rapidly taints, first the exterior then the interior layers, and finally corrodes the wood itself, although it reaches the latter stage but slowly. When the ulcer is very old, there forms over its whole surface a thin, powdery crust of a sooty colour, which, when closely examined, appears to be a mass of little granular bodies adhering to each other, and which many may, at first sight, take for some Byssoid fungus, but which are in fact, nothing but rotten and putrescent matter. In rich places not much exposed to the sun, fruit trees, growing in irrigated meadows, often show these ulcers, which are sometimes universal. They are seen also to occupy the centre of the stem, rather than the circumference. In Willows and Poplars, for instance, where we may find the bark entire and the inside quite rotting away, with a scarcely perceptible exudation. Any apertures by which wet or insects can penetrate into the interior of plants, by causing the disorganisation of the vegetable machine, produce ulcers.

Second species. EXTERNAL ULCERS. — I have doubts whether the external ulcer, attacking only the outer layers of the bark, be not the first stage of the internal one, but as it often arrests its progress without proceeding further, I have enumerated it as a distinct species. It abounds in gummy and resinous trees. It

is easily cured by cutting out the infected part in the manner I shall describe under the fourth class.

Third species. Saccharine Ulcers. — The exuding liquor, rotting and blackening the bark, and collecting on the surface, attracts wasps and flies, and has always a sweet taste, on which account I have called such ulcers *saccharine*. In ordinary ulcers the liquor is insipid, and of a blackish colour ; in the present case it is reddish, or scarcely coloured at all. The corrosion of the solid parts is so small in this case, that I might almost class it among hæmorrhages.

All writers on rural economy who have treated of diseases of plants, have entered into discussions on ulcers, which they appear to me to have sometimes confounded with gangrene. Others have described both diseases under different names, without giving any indications of how they are to be distinguished. One of the best treatises is a most useful one of Boucher on the Ulcers of the Elm, in the Memoirs of the Imperial Society of Agriculture of Paris. Vauquelin, one of the greatest luminaries of chemical science, has analysed the exuding humour. I shall add a few facts which I have frequently verified from my own observation, and which may throw some additional light on the subject.

Ulcers almost always show themselves on the south side of the plant, or towards the east or west, but very rarely on the north side. I have seen them most frequently towards the south-east; the exceptions may be due to the peculiarities of certain localities where the worst winds for vegetation may blow from the south. It is certain that trees growing in moist or swampy situations, or in the vicinity of torrents, are the most subject to ulcers. I should add those also which shed their leaves annually, and especially those which are stripped of their foliage twice in the year, or of which the fruit is gathered by beating. Trees are also more liable to ulcers in proportion as their texture is more porous and less compact, and their juices of a thicker consistence. The above-mentioned Boucher has observed that ulcers rarely show themselves above 6 feet from the ground, and are always not far from the soil. My observations confirm this ; only I have found some exceptions in trees of the first size, such as Oaks, or even Mulberries when trained very high.

As we have seen that trees which are the most stripped or pruned are the most liable to ulcers, it follows that the abuse of these operations must be avoided to prevent them. For their cure there are two methods. The first is the cutting them out, as I have already mentioned ; the other consists in that operation which the Romans called *terebratio*, and to which I would rather give the name of *boring*. With an auger of about two lines diameter, let a hole be bored in the trunk from two to three fingers deep, or even more, according to the size of the tree ; the hole being oblique, so as that the opening looks downwards. A tube of Elder wood, rather than of tin, is then inserted in the hole, and the sap will issue through this tube, gradually discharging the plant of its superfluous humours. This practice was well known to the Romans, for it is clearly spoken of by Pliny, lib. xvii. cap. xxvii., and by Columella, lib. v. cap. vi. in regard to the Elm ; and Palladius asserts, lib. xi. tit. xii., that if ever the Cherry tree becomes gangrened by a superabundance of sap, it must be bored, in order to give the juices an issue.

Authors, speaking of ulcers, generally confine themselves to those of the trunks of trees ; but roots have theirs also, especially those which are large and much branched running along near the surface of the soil. I believe that they are generally due to some laceration, and must be treated like those of the stem. Even in herbaceous plants ulcers are frequent on their roots. Insects gnawing them, instruments cutting them, the cultivator himself wounding them whilst destroying noxious weeds from amongst them, produce disorganisation, ulcers with a stagnation of humours and secretions, and a gradual disturbance of the vegetable functions, which, becoming general, ends in death. The ulcers of herbaceous plants are most fatal, from the rapidity with which they devour, as it were, the whole plant ; and it is very difficult to arrest their progress, unless they are cut out at the very beginning.

LETTUCES.

The varieties of these may be arranged in two classes :

A. Round-headed, spreading, or Cabbage Lettuces.

B. Upright, oblong, or Cos Lettuces.

Those sorts to which numbers are prefixed are considered the best.

Class A. Cabbage Lettuces ; *Laitues Pommées* of the French.

§ 1. Winter and Spring Cabbage Lettuces.

1. *Hammersmith Hardy Green*, aliàs Hardy Hammersmith, Hardy Green, Green Dutch, Green Cabbage, Early Frame, Early Dwarf Dutch, Prussian Cabbage, Roman Cabbage, Lattughe Verde. Of middling size for a winter Lettuce. Leaves dark green, much wrinkled and concave ; the hardiest in cultivation. Seeds white.

2. *Tennis Ball*, aliàs Green Ball or Button, Capucine. Heads small, firm, white and crisp. Hardy, and does not run to seed so soon as the preceding. Seeds black. These two sorts should be sown about the middle of August, and another sowing should be made a month later.

3. *White Dutch*, aliàs Early Cabbage, Early Green for forcing, Early Yellow, Prince, Laitue à bord rouge, ou cordon rouge. Somewhat larger than the preceding. Leaves yellowish green, sometimes tinged with reddish brown on the top. Hearts freely, and is of good quality. Seeds white.

4. *Brown Dutch.* Heads large, brown, cabbaging freely, hardy, and of excellent quality. It is not quite so hardy as some of those above described, but it is considered the hardiest of its size, and hence desirable for cultivation.

Common White Cabbage Lettuce, alias White Cabbage, Royal Cabbage, Hardy Honey, is not to be preferred to those already recommended.

Black-seeded Gotte, alias Laitue Gotte ou Gau, Gotte à graine noire ; and the *White-seeded Gotte*, Gotte à graine blanche, resemble the Tennis Ball, from which they differ in their leaves being more curled and of a lighter green colour ; a variety called *Gotte lente à monter* does not run so quickly to seed as the other Gotte Lettuces. *Laitue Passion, ou de la Passion, Grosse Crêpe, Petite Crêpe, Dauphine, Morine, Coquille à graine blanche, Coquille à graine noire, Laitue George*, are small varieties of winter Cabbage Lettuces, differing but slightly, and scarcely worth distinguishing. We observed the Laitue George was one of the sorts employed for early forcing in the kitchen garden of the palace of Versailles.

§ 2. Summer Cabbage Lettuces.

5. *Neapolitan Cabbage Lettuce.* This is, unquestionably, the best of all the summer Cabbage Lettuces ; it is large, firm, white, crisp, and of excellent quality ; it Cabbages early, yet it is longer in running to seed than any other. The seeds are white.

4. *Versailles*, aliàs Laitue de Versailles, L. de Versailles blonde. Leaves paler green than those of the preceding ; Cabbages white and crisp ; of excellent quality.

5. *Large White Cabbage Lettuce*, aliàs Swedish or Sugar, Saxony, Late White Cabbage, Princesse, Fine Large Mogul, Royale à graine blanche, Blonde Paresseuse, Blonde d'Eté ou Jaune d'Eté. Leaves smooth, head large, compact, rather flat ; not so early as the two preceding, but a good summer Lettuce, not running quickly to seed in hot weather. Seeds white.

Black-seeded Yellow, aliàs Blonde à graine noire, Royale à graine noire, Blonde de Berlin. Closely allied to the preceding, differing chiefly in the colour of the seeds.

White Silesian, aliàs Drumhead, Imperial, Spanish, Large Green Head or Cabbage, Batavia blonde ou Silésie. This is one of the largest ; leaves undulated on their margins, pale green, slightly tinged with reddish brown on the outside ; apt to acquire a bitterness in dry weather. Seeds white.

6. *Malta*, or Laitue de Malte, a superior variety of the preceding ; leaves pale green, smooth ; head flat, compact, blanching white and tender. Seeds white.

Imperial, aliàs Union, Impériale ou Grosse Allemande, and which differs only from the Laitue Turque or *Turque à graine noire* in having white, instead of black seeds ; is a good Lettuce, of large size, but not equal in quality to the Neapolitan, Versailles, and Malta.

Mogul, aliàs Superfine New French, Laitue de Hollande, Grosse brune paresseuse, Grosse grise ; the *Méterelle*, aliàs Nonpareil ; *Blonde Trapue ; La Cocasse à graine noire*, and *à graine blanche ; Palatine*, aliàs rousse, ou Petite brune ; *Sanguine ou Flagellée à graine blanche*, and *à graine noire* are names of Summer Cabbage Lettuces possessing less merit than the sorts above indicated.

Class B.—Cos Lettuces.

7. *White Paris Cos*, or Romaine blonde Maraichère. This is the very best Cos Lettuce ; very large, light green, leaves hooded at the top so that they close in without tying, blanching white, crisp, so excellent that one would suppose no higher degree of perfection could be attained as regards a summer Lettuce. Seeds white.

8. *Green Paris Cos*, aliàs Romaine verte Maraichère, Chicon, ou Romaine verte Maraichère, Kensington Cos, Sutton's Superb Green Cos, Ady's Fine Large Cos. This very much resembles the preceding ; but is of a darker green, and hardier, therefore is preferable for sowing early in spring, and also for autumn use ; in warm, sheltered situations, it will stand the winter, if the latter prove mild. For the generality of winters, however, a hardier Cos is required ; such is the following, the

9. *Brown Cos*, aliàs Bath Cos, Brown Bath Cos, White-seeded Brown Cos, Sutton's Berkshire Brown Cos, Wood's Improved Bath Cos. This is the best Cos for standing the winter ; it is large and of good quality, blanching very crisp, therefore its brown outside should not be considered objectionable.

10. *Artichoke-leaved Lettuce*, or Romaine à feuilles d'Artichaut ; leaves long, erect, much cut, somewhat resembling those of an Artichoke, the plant forming a large tuft, the central portions naturally blanching tolerably well ; but when the process is assisted by tying, it becomes exceedingly tender and excellent, retaining its qualities even after the first frosts have deteriorated other kinds. It is a new sort, which should be sown in June and July. The seeds are black.

The above are considered the best kinds of Cos Lettuces ; others in this class are the *Early Green Cos*, aliàs Egyptian Cos, Brighton Cos, Brighton Green Cos ; *Alphange Cos*, aliàs Alphange blonde à graine noire, and Alphange à graine blanche ; *Golden Cos*, aliàs Florence Cos ; *Romaine blonde de Brunoy*. There are also several varieties spotted or streaked more or less with red, amongst which may be enumerated the *Spotted Cos*, aliàs Aleppo, Bloody, Sanguine, ou panachée, Romaine panachée a graine blanche, *Romaine rouge dorée*. *R. T.*

Home Correspondence.

Boronias.—Most of the species of Boronia require great attention to grow them well ; and in consequence of this, except at the London exhibitions, they are rarely seen in a condition that would entitle them to the name of a perfect specimen. Taking the different species in alphabetical order, we have first the old Boronia alata, whose pinnated dark glossy green foliage emits a peculiar odour. Its growth is dwarf and bushy, and it forms naturally a compact plant, the dark foliage contrasting beautifully with the pale rose-coloured flowers. B. anemonefolia has the same pinnated foliage, of a dark purplish green. The flowers are pink, outside rusty in appearance, and rather small, compared with those of B. pinnata and serrulata. But it is nevertheless a pretty and conspicuous plant. It is a strong grower, but will, by frequent and judicious stopping, easily assume a bushy character and form a fine specimen. B. crenulata is a species of erect growth, whose weak and slender branches gain an unsightly length before they produce flowers ; this renders the plant unfit for specimen culture, for even by frequent stopping no favourable results can be obtained. B. denticulata, like the foregoing, cannot claim a place in a choice collection. It is of herbaceous character, likes a loamy soil, and differs in many respects from all other Boronias, except B. polygalæfolia and viminea, which are its natural allies, as regards character and treatment. B. ledifolia is still a rare plant, owing chiefly to its extreme tenderness, for it often dies suddenly, and without any apparent cause, even under the most careful treatment ; it is, however, just the kind of plant to attract the attention of such gardeners as wish to excel in growing choice specimens, not for their individual beauty, but in order to produce a proof of their skill in plant growing. B. pinnata is one of the finest plants of its kind. Its pale rose flowers are larger than those of any other Boronia, and it has a handsome foliage ; its young shoots are, however, very liable to damp off, and mildew frequently attacks and destroy the whole plant. It also soon drops its leaves if exposed to a dry heated atmosphere, and it is no small task to steer clear of these two extremes, in order to bring a full grown specimen safely through the dull and dreary months of an English winter. B. polygalæfolia, if I am not mistaken, is identical with B. spathulata ; at all events it is very much like it, and is a plant of no great beauty. It requires the same treatment as B. denticulata. B. serrulata, like B. pinnata, on account of its beauty, deserves all the attention that can be given it. In cultivating it the chief difficulty is to preserve the healthy green colour of the foliage, which is extremely liable to turn brown. This is occasioned by exposure to intense sunlight, by drought, by sudden atmospherical changes from hot to cold, or from dry to wet, by overwatering or extremes of dryness—in fact every too sudden change or check will act with surprising rapidity on its colour. These must, therefore, be avoided. After flowering, all long and straggling shoots should be cut back, and the plant allowed to rest, by gradually withdrawing water and keeping it cool. In spring a moist and warm atmosphere will greatly accelerate a free breaking of the side shoots, and a frequent but gentle syringing now and then will be of great benefit. As the new growths ripen, of course all these stimulants should be gradually withdrawn. B. tetrandra or microphylla is a new plant, said to have been obtained by crossing B. anemonefolia with pinnata, and indeed its general appearance verifies this assertion, for it is exactly intermediate between the two. I have as yet only seen it in a small state, but no doubt it will prove an acquisition, if it combines the more robust habit of B. anemonefolia with the graceful foliage and superior beauty of the flowers of B. pinnata. B. trifoliata or triphylla, like B. ledifolia, is one of the most capricious and whimsical of plants, yielding only to the most skilful and persevering cultivator. Its leaves are very liable to curl, even on vigorous plants, giving them a sickly appearance. This is a serious drawback to its beauty, but the bright deep colour of the flowers renders it a very interesting plant. B. trifoliata often suffers from the attacks of mildew ; it must be kept in winter as near the glass as possible, and very sparingly watered. It will require frequent stopping to keep it bushy; it likes a light fibrous peat, mixed with a liberal quantity of silver-sand. Lastly, B. viminea is a neat plant, though not strikingly beautiful, but it well deserves the little attention it requires. The minute foliage emits a Fennel-like odour, and its pale rose-coloured flowers are produced in great profusion nearly all the year round. It is more easily grown than most of the other Boronias. *E. Ortgies, Chatsworth.*

Origin of Hamburgh Grapes.—It is stated in your last *Chronicle* that the Black Hamburgh Grape may have taken its name from the Alhambra. I think the question easier of solution by supposing it derived its name from the port from which the Grapes might have been originally shipped. I ground my conclusion from an observation I made many years ago when I landed at Barcelona. I expected to see the neighbouring country covered with Barcelona Nuts ; it was quite the contrary. In my rambles in the vicinity, I never saw a Nut bush, and I found on inquiry, that they were called Barcelona Nuts from the port they were embarked from. *T. G. C.* [Surely our correspondent cannot have read the statements lately printed in our columns.]

Worthlessness of Spanish Chestnut, as Timber.—"U. L.'s" condemnation appears so sweeping a one, upon the experience of a couple of trees only, that my woodman suggests that these Chestnuts may have been

shaken in their growth, as Oaks frequently are, by the wind, or other causes, and so rendered of little value. The roofs of Westminster Abbey, the Parliament House in Edinburgh, and many other ancient works, are said [This statement has been shown over and over again not to contain a word of truth; it is one of the most vulgar of errors] to be constructed of it, and the character of the timber to have been too well established during so many ages to be now shaken by its present assailant. Professor Martyn, however, and Daines Barrington, according to Loudon, state, that what is by many taken for Chestnut is only Oak of a different grain. [Certainly.] *T. H., Feb.* 25.——I have read "U. L.'s" remarks, p. 102, and have to state that my experience of the wood of the Spanish Chestnut is quite contrary to his. I have it in buildings 17 years old quite as good and sound as when it was placed there. Many years ago I made a collection of transverse specimens of woods. That of the Spanish Chestnut is $1\frac{1}{2}$ inch thick and 11 inches in diameter, including the white wood and the bark. The white wood is an inch wide, and has been a little worm-eaten, but the rest of the wood is quite firm and sound, as is the bark. The white wood in my specimen of Oak has suffered more from worms than my specimen of Spanish Chestnut. I have lately made farming gates, with their posts of Spanish Chestnut, and about a year ago put up several planks for Vines to climb, and which are as much exposed to the weather as they can be. The Spanish Chestnut has very much less of white wood than an Oak of the same diameter. I would not recommend that they should be planted on damp soil, as my experience is against it; the young trees having died when thus treated. My Spanish Chestnut trees grow on a deep sandy soil, and are very much superior to Oak trees planted at the same time, viz., 1810, and in the same plantation. In Hunter's notes on Evelyn's "Sylva," it is stated that "This beautiful tree deserves to be ranked with timber trees of the first class, whether we consider its ornamental appearance when growing, or its uses when felled." "It is superior to the Oak for the making tubs to hold liquor, because when seasoned it will not shrink or swell. For smaller purposes it has its superior advantages. Poles of this tree for Hops or Vines will last longer than any other; and stakes of the underwood will last nearly twice as long as those of any other sort." I suppose "U. L.'s" failure must have arisen from the peculiar nature of the soil in which his trees grew. From what I know of this tree, if I could pass my life over again, I would make large plantations of the beautiful and useful Spanish Chestnut. *C. A. A. Lloyd Oswestry.*

The Circulation of the Sap.—The circulation of the sap in plants is intimately connected with vegetable development. It is not a mere botanist's question, but concerns the gardener in a more eminent degree. The existence of an upward current of sap, is established. The question is, do the elaborated materials out of which the plant is to build up every part of its structure form a descending current. I would not attempt to decide this; but my own opinion is, that it does not. The apparent descent is the mechanical action of a dense fluid-gravitation. There are so many examples, furnishing apparent proof on both sides of the question, that in the present state of botanical knowledge, I think it would be difficult to decide. Two plants of Melia Azedarach were growing in one pot. It was thought advisable to cut down one to the surface of the soil. As it was in the spring, a protuberance was in a few days perceptible immediately between the bark and alburnum. This gradually increased, as if to cover the wound with new wood. But in the course of the summer a bud was organised, which produced, not a shoot, but a raceme of flowers, without a leaf. A Horse-Chestnut tree of a foot in diameter was cut down in the winter, leaving a small portion of the old trunk above the collar, but no branch or leaf. In the following summer new wood was produced, rising in a protuberance from between the bark and the alburnum, and with which it held no connection, at the surface of the soil, both being dead for more than an inch from the surface. As I am interested in such inquiries, I detached a portion of the tree and preserved a drawing of it. From the new wood sprang several shoots, perfect in every part, and the pith disappeared at the junction with the wood from which it sprang. This was very confused in its organisation, being exactly similar to that produced where a branch is removed or a trunk injured. Now in these two instances there could be no descent of the sap, neither could the shoots or flowers spring from pre-organised buds. If there is a descent of the proper sap from the leaves of a plant to its roots, why does not the trunk of a grafted tree, below the point at which the union takes place, assume the character of the part producing leaves, and in which the elaboration of fluid is said to take place? *George Lovell.* [This question has been repeatedly answered.]

Peas.—I beg to inform you that I have had great experience with various new sorts, and that I consider the best three to be, Warner's Early Emperor, Fairbeard's Champion, and Ward's Incomparable. I suppose you will not think it strange that the last of the three is an old Pea with a new name. I have grown it for 10 years, and obtained it at Cambridge in 1840 with the name "Green's Superb Tall Marrow." I am quite confident it is the same Pea, and it has peculiarly good qualities as a late variety. *Clericus Rusticus.*

Strawberries succeed Planted on Onion-beds, and by this system a season in their growth is saved, an important point where land is scarce or high-rented. My plan is as follows: when I have sown my Onions (broadcast in March), and the beds are raked and finished, I take a line and dibble and plant the Strawberries in the usual way, regardless of the Onions, leaving 2 feet between the rows, and 18 inches between the plants in the row. Both grow very nicely together, but care must be taken to keep the beds free from weeds and Strawberry runners. When the Onions are ripe and removed, the beds are cleaned and some good rotten manure forked in; the plants, by this time, will have become well established, and in a fit state to produce a full crop the following season. If they bloom the first year, the flowers should be nipped off with the finger and thumb, in order to make the plants healthy and strong. *An Economist.*

Rain which fell at Cobham Lodge, Cobham, Surrey, in 1849, as measured by Howard's rain guage:

January	1.44	August	0.69
February	1.47	September	2.42
March	0.88	October	4.70
April	3.15	November	1.00

Henry H. Treby.

To make Skeleton Nests for Canaries to Build on.—Get a piece of wood turned so as to fit exactly the inside of a nest, then procure a piece of soft cow hide. The in-sole leather or belly part is the best, and cut it to the size required; put it into warm water to soften, and after that place it on the block, pulling it up and stretching it well, then tack it to the block all round, and rub the creases in with a round piece of wood or bone. When the creases are all well smoothed down, leave it near the fire to dry. After it is dry, cut it round to the depth of 2 inches, put a hoop of No. 12 wire round its mouth, and bind it round with a hazel binding. You may ruff the inside and line it if you please. When finished this nest has the appearance of half a nut shell, and canaries find much more pleasure in making their own nests when supplied with proper materials to build with, in the above shell nests, or nest shells, than they experience under any other method of treatment. *John Pell, Athlone.*

The Ageratum cœlestinum is, I fear, a much neglected plant, except, perhaps, for bedding out purposes. I have this season proved it to be a valuable winter-flowering conservatory plant, its beautiful blue flowers forming a pretty contrast with those of Salvia splendens, scarlet Pelargoniums, &c. Being deficient in winter-blooming plants last autumn, and being anxious to make up for the loss as far as possible, I took up many plants from the borders, and amongst them A. cœlestinum, and potted them in good-sized pots. I then placed them in a shady situation for few days, and afterwards put them into a cool house, removing them to the conservatory as they came into bloom. Previous to taking them up from the borders, I cut off all the old and crooked branches, leaving only those which appeared healthy and likely to produce a continuous bloom. They are now in full flower, and have been so for nearly three months past. *H.*

The Scarlet Runner.—In November of the year 1830, when I was at Lord Canterbury's, I saved a number of roots of Scarlet Runner, and stored them in moderately damp mould away from frost. These same roots were planted out in single rows, 1 foot asunder, some time in March or early in April, the crowns being placed half an inch below the surface. Beans (Scarlet Runners), were sown in rows at the same time. The transplanted roots came into bearing just one month before the sown seed. This afforded me a lesson which I did not forget; I have had several roots three years old, but one in particular I grew for seven years, and this one I exhibited at the May show at Chiswick in 1834. Many were surprised to see a Scarlet Runner 10 feet high full of flowers and Beans, the produce of a plant forced in a Vinery. From this little experiment I would infer that if cottagers saved their roots in autumn, and put them carefully by, they would have this valuable vegetable a month earlier on their tables than they now do. Another way of saving the roots is to leave them in the ground all winter; but this plan is not to be recommended, the plants will have exhausted the ground very much during the summer, therefore they should be replanted in fresh ground. I should mention here that if fine roots are wished for in autumn, care should be taken not to allow many seed pods to ripen, as the ripening process robs the roots of much of the returning and elaborated sap. I find another point worth recording with respect to dwarf French Beans. A few pans not wanted for potting were by chance placed out in a corner; this was in the beginning of April; they had been nearly killed by frost and red spider, &c.; ground was prepared for them on a south border, the plants before planting were dipped in strong brimstone water, in case any spider should be alive on them; two rows were planted, and two rows were sown with the early Dun Beans, the transplanted ones looked badly for a fortnight or so, but almost as soon as they began to grow they showed blossom, and came into bearing three weeks before those from seed. This was in a warm garden on the banks of the Thames belonging to the under secretary of war. *James Cuthill, Florist, Camberwell.* [Care must be taken that these roots are not eaten. They are poisonous.]

Begonias.—B. manicata, like other Begonias, is a very desirable plant, on account of its flowering in winter. I have several specimens of it now beautifully in flower, one more especially is a complete garland, bearing upwards of 100 spikes; this plant is about three years old. The merits, too, of Begonia fuchsioides cannot be too often pointed out; for it is nearly always in flower. I have plants of it here in beautiful bloom, and they have been in the same condition ever since last summer; two of them stand above 6 feet high. B. nitida and B. insignis are very desirable plants on this account, and ought to be in every collection. *C. Hewson, Newton-house.*

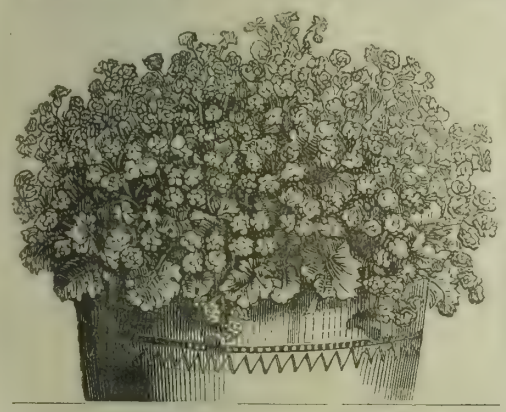
The Forcing of the common Laburnum, for the decoration of the conservatory during winter, is not so much practised as it should be. It is a most desirable plant for this purpose. I have three plants of it in beautiful bloom, one of them bearing about 150 racemes of flowers. The plants are young, and about 4 feet in height, dwarf standards. *C. Hewson, Newton-house.*

Vipers.—The fact of vipers casting their skins in an inverted state, may be satisfactorily proved by the inspection of one which has recently come into my possession, obtained from the Zoological Gardens in London. It was shed by a Cobra capello, and is 47 inches in length, and 6 inches in circumference in the largest part. The markings on it present a most beautiful appearance, and it does not present a fracture of any description. The delicate scale that covered the eyes, appearing concave on the outside, will decide the manner in which the reptile discharged his cast garment from his body. *E. M. B., Brighton, January* 31.

Johnson's Gardeners' Almanack.—It is curious to observe the various errors which creep into books, written by those who profess to be masters of the subjects on which they address the public. Thus Johnson, in his "Gardeners' Almanack" for the present year, gravely states, at page 22, that by planting Cabbages 3 feet apart, there will be 7400 required to plant an acre. Now as Cabbages standing 3 feet apart, will occupy each 9 square feet, or 1 yard; it follows, there being 4840 such yards in an acre, that the writer's imagination has added 2560 Cabbages to the quantity an acre will really contain! *A. B.*

Mistletoe on the Oak.—Some time ago there was a good deal said on this subject. A few years since fine bunches of it grew on an Oak in Saint Dials' farm, in the parish of Monmouth. This Oak was of the pedunculata or Robur kind; and although its branches were intertwined with those of other Oaks of the same sort, the Mistletoe confined itself to the different parts of the same tree, and would not travel beyond it. As the mosses which grow on the pedunculata Oak are very different from those which live on the sessiliflora in this district, I think it right to name the kind of tree which carried the Mistletoe. This was the only instance in which I ever noticed this parasite on the Oak. *U. L.*

Societies.



BOTANICAL OF EDINBURGH, *Jan.* 14.—Professor Fleming in the Chair. Specimens were exhibited from Lieutenant Robert Maclagan of Sorinjan tulk and Sorinjan sheeren, being the corms of Indian species of Colchicum, which are used as cures in rheumatism; also, a peculiar root, known in India by the name of Kaleekootkee, and used by the Hakeems in nervous diseases. Mr. M'Nab exhibited the flowering rachis, with terminal bracts of the red-fruited variety of Musa sapientum, or Banana. The fruiting plant was 14 feet 6 inches in height above the tub, exclusive of its leaves, which were 10 feet long and 2 feet 6 inches broad; the stem was 35 inches in circumference at its base. The weight of the head of fruit, when in its perfect state, was estimated at from 75 lbs. to 80 lbs. The plant is one of the largest in cultivation, and also one of the most prolific, the fruit ripening successively over a period of two months. The following papers were read:—1. Notice of some of the rare plants observed in Orkney during the summer of 1849. By J. T. Syme, Esq. 2. On the Embryogeny of Hippuris vulgaria. By J. S. Sanderson, Esq. 3. Account of an excursion from Simla to the Burenda Pass, and other parts of the Himalaya in July and August, 1847. By Lieutenant R. Maclagan, Bengal Engineers.

Garden Memoranda.

MESSRS. HENDERSON'S NURSERY, PINE-APPLE PLACE.—The show-house here is gay with Hyacinths, Narcissus, Tulips, Crocuses, Single-fringed Chinese Primroses of the white and pink kinds, Cyclamens, Cinerarias in great variety and perfection, Indian Azaleas, Camellias, Spring Heaths, as regerminans, gracilis, Willmorei, &c.; Kalmia glauca, Rhodora canadensis, the yellow-flowered Linum trigynum, Fairy Roses, Persian Lilacs, Acacias, such as armata and juniperina, and various plants, which, by a little forcing, prove ornamental at this season of the year. In the stove were one or two varieties of Hippeastrum aulicum, the last of a fine display of this showy Amaryllid, than which few things are more handsome during winter, and by a

little management it may be had in flower for several months in succession. The dark variety of Barbacenia squamata was in bloom here, in company with the pretty white-flowered Oldenlandia Deppeana, which keeps in blossom the whole winter through, and Bilbergia zebrina, whose beauty consists in the large pink floral leaves rather than in the little greenish-yellow flowers, was just going out of bloom. It generally flowers here twice a year—in spring and in autumn. In the Heathery we noticed a good plant of the rose-coloured Indian Daphne (D. indica rubra), whose fragrance perfumed the whole house. This is one of those plants which everybody might cultivate who possesses a cool greenhouse, for it is as easily managed as a Camellia, and its sweet scent will be sure to render it an universal favourite. Some small plants of it, apparently newly grafted, forming, as it were, little bouquets of pink flowers backed up by some half dozen bright green leaves, were very attractive.

In the specimen house there were some admirable examples of the different varieties of double Chinese Primrose, viz, the purple, white, and fringed white—the latter having an agreeable tinge of blush in it. Than these we have seldom seen better or more graceful specimens of this fine winter flower. One of the double red measured upwards of two feet across, and, although insufficiently in bloom, it had 130 fully expanded blossoms on it, of large size and fine colour. The latter is obtained by keeping the plants in a cool well aired house. It was in a 14-inch pot by 9 inches deep, and had been grown in about equal parts of fibry loam and flaky leaf-mould, mixed with a little sand. Our wood-

cut will give some idea of the appearance of a well grown specimen of one of the white-flowered kinds; the red sort is more diffuse and graceful in habit. The way in which these plants are cultivated here is to strike them from cuttings in spring, keep them growing slowly till August, when they are liberally shifted and more generously treated, and they blossom about Christmas. After they have done flowering they are placed near the glass, and kept rather dry and cool, so as to give them a season of rest, till the beginning of August, when they are repotted, their branches spread out, and pegged down; and under this kind of management they blossom in the second year, in the manner above described, beginning about Christmas, and continuing on in perfection till the following May. The old plants are thrown away after they have bloomed the second year, and their places are supplied by one-year-old plants. The latter are allowed to blossom the first season, but they are not so large and fine as they are the second year. In the same house were Hovea pungens major, a kind remarkable for its beautiful deep purple colour; but difficult to cultivate; a good specimen of Mirbelia grandiflora; Styphelia tubiflora, which has been in flower all the winter; Bossiæa lenticularis; the variety of Correæa called "Brilliant;" and last though not least, Eriostemon intermedium, one of the best of all greenhouse shrubs. Among the Orchids, which were in excellent health, there were in flower Phalænopsis amabilis and grandiflora, Phaius Wallichii, Odontoglossum pulchellum, some Oncids, and Dendrobes.

Reviews.

Paxton's Flower Garden for March. By John Lindley and Joseph Paxton. London: Bradbury and Evans.

The following memorandum published with the first Number of this new periodical explains the authors' views:

"The design of the work now offered to the public is to supply, in Monthly Parts, as full an account of all the new and remarkable plants introduced into cultivation as is necessary to the gardener, and as the price and extent of a periodical will permit. The history of such plants will be sought in the Botanical Works published on the Continent, to which English cultivators have little access, as well as in those of our own country, and in the Gardens or Herbaria from which they are derived. It is expected that by this means the English reader will be able by degrees, by mere reference to the indexes of matter which will accompany each Number, to ascertain the real horticultural value of the numberless so-called novelties with which the lists of dealers are crowded. The infinite number of double names, which botanists call synonymes, but which in common parlance are termed *aliases*, will also, it is hoped, be gradually referred to their true denomination, and the purchaser thus be spared the mortification of finding that after procuring half a dozen different names he is still in possession of but one species, and that perhaps one with which he was previously familiar. To effect this purpose it is proposed to separate each Number into two distinct parts. In the First Part will be found Three Coloured Plates of Plants, which from their beauty or remarkable tints especially demand this expensive style of illustration. Here it is not proposed to introduce any species which can be as well represented without colour; by which means a large part of the expense of Botanical periodicals will be saved for the purpose of being applied to the embellishment of the Second Part. Nor will the public be in any respect a loser by this arrangement, for it is doubtful whether more than three really fine New Plants appear in a month in this country, on an average. The title of the Second Part, 'Gleanings and Original Memoranda,' fully explains its purpose. It will consist of Notices, long or short, according to the importance of the subject, of as many plants published in contemporary publications, or observed by the authors, as can be enumerated in eight or ten pages. Unimportant species will be merely mentioned; those of higher interest will be described at greater length; and of the most remarkable there will be introduced Woodcuts, in which an attempt will be made to combine accurate representations with some pictorial effect. The effect of this arrangement is to introduce into the present number an account of 35 species, of which 11 are figured. Supposing each number to contain a similar amount of species, a yearly volume will include 420 accounts of plants, of which 132 will be illustrated; by far the largest number yet comprehended in any Scientific English Botanical Periodical.

"In the selection of species for full illustration, it is intended to divide the plants as nearly as possible between Stove, Greenhouse, and Hardy Plants; so that each department of the Flower Garden may be equally cared for. The editors, however, anticipate some occasional difficulty in accomplishing this part of their plan, in consequence of the much larger number of novelties annually introduced to the hothouse and greenhouse than to the open borders. In the present Number the species figured are, Stove three, Greenhouse two, and Hardy six. On no occasion will there be more than one coloured Orchid in each Number.

"Since this work is intended for English readers, the English language will be adopted, as far as possible, in all familiar names and descriptions. English names of the plants represented in the coloured plates will be given in preference to technical Latin ones, in the hope that by degrees the ear may be relieved from the necessity of dwelling upon sounds, which, even to the learned, are often harsh and unpleasant. There seems to be no valid reason why the system of talking Greek and Latin, without understanding it, may not be banished from familiar Natural History. At the same time, for the convenience of Foreign Naturalists, and of those who prefer technical to familiar words, the names employed in strict science are also given, and the distinctive characters of the species are added in Latin.

"The Proprietors also wish to state, that in order to spare their Subscribers the necessity of continuing to purchase a book of this nature for an unlimited series of years, and of thus incurring an expense of unknown amount, it is intended absolutely to terminate the present work with the tenth volume. But with the cessation of the present work it is intended that another, with a new title but upon a similar plan, shall immediately succeed it; so that those who may wish to extend their subscription will have the opportunity of doing so, while those who may be desirous of discontinuing their purchase will be in the possession of a complete work. In this way the necessity of breaking up a periodical into what are called series, or new issues—which are merely thin disguises, intended to conceal the purchase of fragments of a work—will be entirely avoided."

Personal considerations prevent our adding any remarks of our own, except that the coloured figures consist of Drummond's Side-saddle Flower (*Sarracennia Drummondi*), the glittering gland-bearing Trumpet-flower (*Adenocalymna nitidum*), and Walker's Cattleya (*Cattleya Walkeriana*), which, together with a pictorial title-page, confirm the opinion entertained of M. Constans' talents. The woodcuts represent *Aristolochia picta*, the fine new Berberries called *loxensis*, *Darwinii*, *tinctoria* and *japonica*, *Grammanthes gentianoides*, *Spiræa decumbens*, and *Calandrinia umbellata*.

A Short Treatise on the System of Wire Fencing, Gates, &c. With explanatory Copper-plate Engravings. By C. D. Young. Burness, Edinburgh.

The volume before us, although in some measure explanatory of the various articles manufactured by the eminent firm of which Mr. Young is a partner, enters into the history, adaptation, and qualities of the subjects represented by the illustrations. Mr. Young treats at length on the universal application of wire fencing in the arrangement of park and garden scenery. There can be no question that the use of iron fencing in the division of grounds, and in protecting masses of trees, is a very great improvement in a pictorial point of view, as compared with the old practice of protection by means of hedges and ha-has or stone walls. Cases, however, occur, in the vicinity of almost every mansion of any pretensions, in which we would by no means employ wire fencing, as for instance in gardens of an ornamental kind; propriety and good taste would suggest something different. Therefore Mr. Young's views and ours are at issue on this point. Many of his arguments, especially those that relate to the saving of land, durability, and economy of first erection, are invulnerable; and one of the most important uses of Mr. Young's treatise will be the aid which its numerous illustrations afford to country gentlemen, in enabling them to determine the kind of fencing or gates most eligible for their requirements. The prices, too, of all the forms of fences, gates, bridges, &c., are given in the catalogue annexed to the work—an important item, by which gentlemen, however remote, can ascertain to a shilling the expense of any work he may contemplate having executed, before he begins operations. On these, as well as on other grounds, we consider that Mr. Young's treatise will prove of much service to all landed proprietors. *R. G.*

The Catalogue of Seeds sold by J. C. Wheeler and Co., Gloucester, appears to us to deserve notice, because of the stand which its authors make, in common with ourselves and others, against the useless incomprehensible seed lists of the day. In this, as in all matters of taste, there will be a difference of opinion as to the relative quality of varieties; yet the mass of buyers, who have no fancies, but who dislike being perplexed, and are satisfied with what is excellent, will greatly prefer a short, select seed list to an interminable labyrinth of names, which, for the most part, represent nonentities, or rubbish. Messrs. Wheeler's little book will do something to satisfy their expectations.

Miscellaneous.

Death of Mr. Scott, gr. to Charles Barclay, Esq., of Bury Hill, Dorking.—We regret to announce the death of this intelligent and excellent gardener, which took place on the 22d ult. Some months before his decease he had an attack of paralysis, which so unfitted him for business that he had to leave Mr. Barclay's service, after he had lived with him nearly 20 years. The immediate cause of death was apoplexy. Mr. Scott bore an excellent character and was much respected by all who knew him.

Sale of Orchids.—A small importation, from central India, was sold the other day by Mr. Stevens, at the following prices:—Dendrobium Devonianum, from 1*l.* to 2*l.* 2*s.*; Cœlogyne maculata, a new kind, with flowers as large as C. Wallichiana, white and yellow, with large blotches of crimson purple on the lip, from 2*l.* to 3*l.*; the rare Dendrobium Cambridgeanum, from 2*l.* to 3*l.*; a large mass of Cœlogyne cristata, 5*l.* 10*s.*; smaller examples of the same, from 1*l.* to 5*l.*; C. Wallichiana, from 2*l.* 10*s.* to 6*l.* 10*s.*; Dendrobium Farmerii, from 2*l.* to 4*l.* 10*s.*; D. Dalhousianum, from 1*l.* 18*s.* to 2*l.* 4*s.*; D. Griffithianum, from 2*l.* to 4*l.* 10*s.*; D. Paxtonii, from 2*l.* 10*s.* to 4*l.* 5*s.*; D. Gibsonii, 1*l.* 10*s.*; "a new species of Cœlogyne," from 2*l.* 10*s.* to 4*l.*; ditto Cymbidium, from 1*l.* to 2*l.* There were in all 232 lots.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Plants in general are now about to commence their new growth, and with the gradually increasing light will require a proportionate increase of heat and moisture. Encourage their healthy development by sufficient room, and by placing them as near the glass as circumstances will allow. Admit sufficient air at all times to ensure a circulation, and as much more as the weather renders necessary, but carefully avoid cold currents during the growing season. In repotting, be guided more by the state of the roots than by the tops, as the latter, when exposed to a disproportionate heat, are liable to start into growth without the roots progressing in a corresponding ratio, and they are therefore not so well prepared to take advantage of the new soil as those whose roots are in motion; these last may be repotted with safety and propriety, and when the plants are passing through your hands for this purpose, let everything needful in the way of pruning, tying, or freeing them from insects be done at once, that your work may progress in the most economical manner. Before any plant is potted the state of the soil should be carefully examined, and if the ball is dry it should be soaked in a pail of water, not too cold; after which it should stand long enough to allow the superfluous moisture to drain away. A sowing should now be made of Thunbergias, Ipomœas, and other stove annuals required for the decoration of the conservatory in summer and autumn; the two first, with others of a similar character, should be sown in three-inch pots, two seeds in each, and the rest in ordinary seed-pans; the whole should be plunged in a hotbed, and shaded till they make their appearance above ground. As the majority of plant houses are better adapted for small and moderate sized plants than for large ones, and as the same description of plants are most generally useful for placing in ornamental China vases in the drawing room, &c., it is important that, at this season, a young stock be raised of all the choice things which are ornamental and interesting as small plants. And this matter should be particularly attended to with reference to such as will be useful next winter; of a few of these we subjoin a list. Euphorbia fulgens, Gesnera elongata, Manettia bicolor, Begonia nitida and B. insignis, Abutilon venosum, Poinsettias, Polygalas, Francisceas, Tremandra verticillata, and T. Hugelii, &c. Such well-known favourites as Chrysanthemums, Cinerarias, Primulas, &c., will suggest themselves to every mind. All plants of which it is desirable to increase the stock should be propagated as soon as they

make shoots fit for the purpose; these should be watched and slipped off with a heel, when 2 or 3 inches long, as they will strike with great facility in that stage. The most suitable circumstances are, a temperature resembling as nearly as possible that in which they have been grown; taking care to keep them close, to shade them from sunshine, and to guard against damp, or excessive dryness.

FORCING DEPARTMENT.

VINERIES.—It is too common a practice to crop Vines to a greater extent than they are able to bear. It is thought that by leaving rather more than enough, even though some of them do shank, the greatest possible weight of good fruit will be obtained. This is of course a great mistake, as the portion of fruit which does not come to perfection has exhausted a considerable proportion of the strength of the plants to no purpose; besides which, their entire energy is monopolised by the fruit, and thus no stored up accumulation can be made to furnish the future crop. This evil should be prevented by reducing the bunches to a number consistent with the present and future strength of the plants. In the first place, the spurs should be limited to a number which will allow of their leaves being freely exposed to the influence of the sun and air; and of this number not more than half should be allowed to produce fruit this year; nor should any one of these be allowed to mature more than one bunch. The remaining half of the spurs ought to be confined to making wood for next year's crop. Weak spurs which are not to produce fruit this season should be encouraged, by allowing them to produce six or eight leaves before they are stopped; this practice will be particularly useful with Vines which are weakly from excessive cropping last year, or from other causes. To expose the foliage as much as possible to the action of light, the spur shoots should be tied at right angles with the main rods. Any plants in pots, under the Vines, will by this be much shaded; but if good Grapes be the chief object, other considerations must not be allowed to interfere with whatever is necessary for their perfect development. PEACHES.—In disbudding Peach trees it is desirable to retain as many of the side or even fore-right shoots as will fill with leaves any parts of the tree which would otherwise be bare; all the young shoots so retained, with the exception of those required for laying in, should be stopped above the third leaf, as in spurring. By this means the appearance of the trees will be improved, and a supply of fruit-bearing spurs secured, where there would otherwise be nothing but naked wood; and if at any time it be found necessary, they will be available for the production of young wood to fill up where old worn-out branches have been removed. We have generally found the largest and finest fruit in our Peach-houses upon these spurs; and sometimes on those situated very near the main stem of the tree. This is a new idea in Peach management, and it is one that when once known will be readily adopted in all fan trained trees. Constant attention must be paid to tying in the young shoots nearly parallel with those they proceed from, as much of the beauty of fan-trained fruit trees depends on early attention to this matter.

FLOWER GARDEN AND SHRUBBERIES.

If the soil of any of the beds or clumps for masses has not been prepared for its summer occupants, it should be immediately done. Where the same description of plants is grown successively in the same beds, it is advisable to remove the whole, or a large portion of the old soil, once in two or three years, and to fill up with new material. For some plants, however, as scarlet Pelargoniums, this practice would be injurious, unless the soil were very poor, for they generally grow too luxuriantly. Many mass plants, however, particularly annuals, take more from the soil than can be supplied to it in a moderate top-dressing. Where a certain kind of plant suits a particular situation, there is no impropriety in placing it there every year, provided the soil is frequently renewed. Pay extra attention to the propagation of the more excellent bedding plants, preferring those which combine a compact habit and hardy constitution with a decided colour. Dwarf, compact, blue beds will be best furnished by the different varieties which have originated from Lobelia gracilis; they are increased with great facility by cuttings or seeds; the latter should be sown immediately in boxes or pans, and pricked out into a frame of soil, as soon as they are large enough to handle. The best variety is the L. Erinus compacta grandiflora, than which a more beautiful plant for dwarf dense masses of a deep blue or violet colour does not exist. For a taller bed of pale blue the Ageratum mexicanum is not surpassed; and in damp situations, where many other things would prove a failure, nothing surpasses the late-flowering Forget-me-not (Myosotis scorpioides). Verbenas will supply beds of all shades and colours except yellow and good blue, but the greater portion of the varieties in cultivation are too diffuse in habit to make compact effective beds. These are plants of which gardeners are very liable to get too many varieties; if about a dozen of the most distinct, free-flowering, compact-growing kinds are selected, the rest may be very conveniently discarded. White is one of the most difficult colours to do satisfactorily; of flowering plants for this purpose, Verbena Mount Blanc is one of the best; and next to this, we may mention, the varieties of Pelargoniums with variegated leaves, or the variegated Alyssum; the latter planted thickly answers the purpose very well, as the flowers and leaves are both white. With these may be mentioned Lobelia Erinus compacta alba, which makes a nice dwarf bed if planted thickly. Get the fancy varieties of Pelargoniums as strong and bushy as possible, previous to planting out, so that they may begin to bloom evenly. They all flower in such abundance that there is little doubt of their continuing to make a good display throughout the season, particularly if the soil is light. Sandy peat, a little loam, and leaf-mould suit them best.

FLORISTS' FLOWERS.

The beautiful, the sweet-scented Auricula first claims our attention. They are now moving, and every day the foliage appears to freshen. Then comes the truss of flowers. To the amateur who exhibits, this is a most critical and interesting period; for as it rises, should a frost occur, a check inevitably takes place. To guard against this, as soon as the formation of the buds is perceptible, a careful covering of the frames is requisite, for we have, during a series of years that we have cultivated this beautiful spring flower, known the whole stock to be seriously damaged by a casual neglect. Every one knows that in windy and frosty weather, the lights should be kept on the frames, but we would advise that when they are of wood and easily moved, that, at the end of this week, a brick should be placed under each corner, so that, though the lights are down, a free circulation of air should take place; in fact, both for Polyanthuses and Auriculas, this is a *sine qua non*. In CARNATIONS AND PICOTEES we would pot off if the weather is suitable; and now let us advise those who are really fond of a first-rate Picotee to get Duchess of Sutherland, Lorina, and some few others that are offered by first-rate cultivators. We are sure their money will be well laid out, and their satisfaction great. These flowers are fashionable, and well they may be, combining as they do beauty, symmetry, and fragrance. Dahlias, Pinks, &c., next week.

HARDY FRUIT GARDEN.

The winter covering should now be removed from Figs and Vines on outside walls, and the trees should be retrained; but, as entire exposure will be too much at first, it will be necessary to cover slightly with evergreens, or let down a canvas in front of the walls during night, especially in cold localities. As the Apricots on flued walls are coming into blossom, it will be well to go over them, to see that the winter covering of branches does not hang so thickly in any place as to form a serious obstruction to the sun's rays. A little labour will be well expended in going over the Apples, Pears, &c., painting them over with a mixture of lime, sulphur, and tobacco liquid, with as much soot added as will take away the glaring colour of the lime. This will destroy lichens and mosses, as well as any insects which may be about the branches; and as the genial spring weather will soon cause these depredators to creep forth, this is an excellent time for the operation.

Notices to Correspondents.

BACK NUMBERS. Full price will be given for Nos. 6, 18, 28, and 35, 1847.

OUR CORRESPONDENTS were, in one or two cases, accidentally overlooked last week, for which we beg to express our regret.

AQUILEGIA GLANDULOSA: *J O.* See Mr. Grigor's account of it at p. 420, 1848. He there states that the soil which he has found most suitable for it is a rich mellow earth, partaking a little of bog or peat earth, and rather cool and moist than otherwise—approaching to that usually termed swampy. He adds, however, that the age and condition of the plant is of more importance than the quality of the ground; for he has flowered young plants well for a few years on spots apparently very unsuitable for them.‡

ASPARAGUS KALE: *H B.* It has various names, as Egyptian, Jerusalem, and Buda Kale. It is a winter vegetable, and should be planted out in July and August, the second plantation being necessary only where late gatherings are required. Its treatment should be the same as that for winter Greens. We cannot recommend dealers. ‡

BOOKS: *J T.* No such book is accessible to you, unless you can read technical Latin, and have 20*l.* to spare. You had better be content with Loudon's "Encyclopædia of Plants."

BROCCOLI: *M.* Your Broccoli plants are affected by "club." Wood-ashes are largely used against it, and some have recommended nitrate of potash or salt-petre; but we are unacquainted with the effect of the latter, and would advise you to try it first on a small scale experimentally. ‡

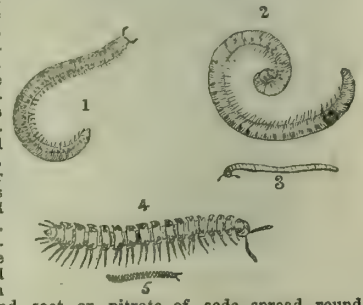
BURNT CLAY: *J W H.* This is the surface soil of heavy land, with the roots, &c., found in it, pared off, dried in the wind and sun, and then thrown into heaps and burnt. Nobody sells such stuff. Your Peas, or *ceci*, are the Chick Pea, Cicer arietinum, or Pois chiche of the French. They are used in the preparation of purées. What is the meaning of the word Ceci?

CRUSHED LIMESTONE: *Anon.* Although you may crush this as fine as silver sand, it will not be beneficial for potted plants, quite the contrary. Nothing will answer such a purpose except nearly pure silex, such as silver sand is. Shell sand and all such calcareous substances are to be avoided.

ELVASTON: *A Lover of the Coniferæ.* We cannot say. Enquire.

EPACRIS: *Tauntoniensis.* Our eyes are not good enough to discover in what respect this is better than 20 other trifling varieties of Epacris impressa.

EMIGRATION: *D J H.* We should much advise you to take some Australian colony, in preference to the United States, in your state of health. New Zealand would be best in that respect.



FORCED STRAWBERRIES: *W H.* Your employer is entirely wrong, as we will more particularly explain next week. The soot kill the plants! Oh! oh!

GARDENERS: *Old Sub.* The only "register for them" we know of is Messrs. Weeks'. (See an advertisement in another column.) But they may be had by applying to Messrs. Knight and Perry, Messrs. Henderson, or any other nurseryman.‡

GLASS FRAMES: *B D.* They may be attached to the wall by hooks and staples. The sooner they are on after the flower buds swell the better. When frosts are gone they may be removed. A fortnight or so before the fruit begins to colour they may be replaced; and after the fruit is gathered they may be allowed to remain till the wood is perfectly ripe—provided your season is wet or your climate a bad one.

GLASS PORCH: *G B K.* For training along the roof, try Bignonia grandiflora, B. capreolata, and Vitis odorata; but these are deciduous. If you must have evergreen climbers without heat, we have no idea what to advise. You might try Mandevilla suaveolens and Tacsonia pinnatistipula. ‡

INSECTS: *W G.* The larvæ sent to us, found in the bed of Rhubarb, are those of some species of two-winged fly, Musca, allied to the common house fly, which were probably bred in the decayed roots of the Rhubarb or in the manure. If in the latter, they are harmless; if in the former, the roots had better be examined, and the decayed parts removed. *W.*—*W D S.* The insects on the Salvia fulgens are a very minute frog-hopper (Eupteryx), whose habits are very similar to those of the common Thrips. The plant had better be removed apart, and then more carefully fumigated, either with tobacco smoke or pounded Laurel leaves, the fumes of which are a deadly poison to insects. *W.*—*J H.* The insects dug up at the roots of Endive are one of the species of Snake-millepedes (Julus). Figs. 2 & 3 in the annexed woodcut, are Julus pulchellus, natural size and magnified. Fig. 1 is the larger Julus terrestris of the natural size, and Fig. 4, Julus complanatus. The plants should be watered with lime-water, and soot or nitrate of soda spread round their roots; then water the plants. Those worst affected should, however, be pulled up and burnt. *W.*—*J C S.* Your Auricula roots are infested with the Julus pulchellus, described in the last answer. *W.*

NAMES OF PLANTS: *B L, Wrexham.* Leucoïum vernum, a rare and charming plant.—*A B.* We hardly understand what you proposed to send. Nothing could be found among the fragments except *seedling Ferns.*—*E D.* What a morsel! We believe it to be Senecio tussilagiuis.—*Amicus.* The fragments are in such a state, that we do not possess skill enough to name them. The Pinus is too young for determination, and the Oncid is as much dried up as if it had been in the engine-room of a steamer.

POULTRY: *Anon.* "Dixon, on Poultry," is reprinting, with additions and will be ready on the 21st inst.

PRIMROSES: *C C.* With us they were in flower about the 5th of February. You are therefore late, which is remarkable for Ireland.

RABBITS: *L N.* The only other hardy evergreen besides Rhododendrons that rabbits will not eat, is, we believe, the Spurge Laurel. In sowing the seeds of Mistletoe on the bark of trees, it is not necessary for the seeds to be fresh gathered, for if seeds gathered when ripe are kept about a month or so, they will grow very well.

RENANTHERA COCCINEA: *E K B.* This very common plant comes from Macao. It may be found in every nursery where Orchidaceous epiphytes are sold; and in all private collections where fine plants are kept.

ROOTS: *A Constant Reader* says, "Do the roots of a plant grow whilst the plant is blooming and ripening its seed?" Our answer is, Yes, but not so fast as when the plant is making wood; and not at all under unnatural circumstances.

RUSSIAN SUPERB VIOLETS: *Mr. R. Shackell*, of Bath, has sent us two or three times specimens of what he calls by this name. It is difficult to form a just opinion concerning Violets without growing them; but we should say that Mr. Shackell's have all the *appearance* of being a very fine robust variety, as we believe it to be.

TENANT RIGHTS: *T F A.* You should consult your solicitor upon a legal question. Newspaper opinions upon law are dangerous and generally bad. We believe the law to be against the tenant.

THE GOLYNOS OAK: *Diss.* Many thanks; but we have already pointed out the existence of the engraving, &c. What was wanted, was not the particulars attached to the engraving, but some proof of the truth of the particulars.

TOADS, LIZARDS, BLINDWORMS: *Anon.* These are not venomous; and that the toad can expel a poisonous liquor is a silly fable.

VINES: *Anxious.* You were too late in pruning. There is no help for it now. Get them into leaf as fast as you can, and the bleeding will cease.

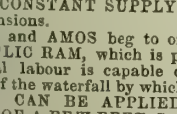
VINE BORDERS: *A K.* It is a bad plan to crop them at all; but if you must have something on them, then sow them with Mignonette or other annuals, or plant them with Verbenas. ‡

WIRE SYSTEM OF TRAINING: *C S.* See Mr. Fleming's paper at p. 435, 1849.‡

MISC.: *A B.* Orange trees may be obtained of any of the large nurserymen. We never recommend dealers.‡—*Sub.* It is not unusual for Stephanotus floribundus to produce seed pods.‡—*Ravenswood.* Just stop the point of your Glycine; nothing more. ‡

SEEDLING FLOWERS.

CINERARIAS: *W F.* 1, colour deep blue, size and texture good, outline a little deficient, a nice variety, and the best of its colour we have yet seen. 2, a shade lighter and a little thinner in the petals, but similar in properties to 1; a nice variety. 3, white, tipped with rosy crimson; a neat flower, but rather small, and too common in colour.*



BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses when completed charged from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; one principle, the roof being formed without wood or putty, and the other principle being wood ratters and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per ft.

HEATING BY HOT WATER.

HOT WATER APPARATUS AND HORTICULTURAL BUILDING.

W. HILL begs respectfully to announce that his improved "FLUE BOILER" may now be had in sizes to suit every description of Apparatus, from that of 100 feet to 2000 feet of 4-inch pipe. Improved STEAM BOILERS, from one horse-power and upwards, adapted either for stationary or portable engines, and guaranteed to be most effective.

Every description of Horticultural Building constructed upon the best principle. Buildings of any kind heated by hot water.

*** A liberal Discount to the Trade.

W. HILL, Horticultural Works, Greenwich.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

Corn and Grass Manure, per ton	£10	0	0
Clover Manure, do.	11	0	0
Turnip Manure, do.	7	0	0
Superphosphate of Lime	7	0	0
Sulphuric Acid and Coprolites	5	0	0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano (with an analysis), 9*l.* 15*s.* per ton, in dock. Sulphate of Ammonia, &c.

LAWES'S PATENT MANURE.

WILLIAM E. RENDLE AND CO., Plymouth, are Mr. Lawes's Wholesale Agents for the Sale of his MANURES, and can supply them at Mr. Lawes's prices, delivered at his Factory, Deptford Creek.—Apply to WILLIAM E. RENDLE and Co., Union-road, Plymouth.

GIBBS' GENUINE PERUVIAN GUANO, *warranted*, at 9*l.* 15*s.* per ton. In the Import Docks.

THE LONDON MANURE COMPANY beg to offer as under, and pledge themselves that every Manure shall be perfectly Genuine:—Corn Manure for Wheat, Barley, Oats, Clover—most strongly recommended from its success last year; it will be found cheaper than Guano, and bear the strictest analysis. Also URATE, Superphosphate of Lime, Sulphate and Phosphate of Ammonia, Nitrate Soda, Fishery and other Salt, Gypsum, Sulphuric Acid, &c.

GENUINE PERUVIAN GUANO.—To insure this free from adulteration, all purchasers, if they prefer it, can receive their warrants from Mr. Purser, and remove the Guano direct from the Warehouses of Messrs. A. GIBBS and SONS, the Importers.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.

Country Dealers and Agents supplied.

POTTER'S GUANO.—This effective MANURE, now greatly Improved, is confidently recommended as a Dressing for all Spring Crops. It is equal to Peruvian Guano, and 25 per cent. cheaper. Also SUPERPHOSPHATE of LIME, GYPSUM, and SULPHATE of AMMONIA, all of guaranteed quality, and Cheaper than at any other establishment in town or country.

Factory, 23, CLAPHAM ROAD PLACE, LONDON.

GUANO AND OTHER MANURES.

PERUVIAN GUANO of the finest quality (as imported by the Contractors) on Sale; also Superphosphate of Lime, Gypsum, Nitrate of Soda, Salt, and all other Manures of known value.—Apply to MARK FOTHERGILL, 201A, Upper Thames-street, London.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.

London, March 2.

TO NOBLEMEN and GENTLEMEN who require a plentiful and CONSTANT SUPPLY of PURE WATER at their Country Mansions.

Messrs. EASTON and AMOS beg to offer their improved PATENT HYDRAULIC RAM, which is perfectly self-acting, and without manual labour is capable of lifting water to 30 times the height of the waterfall by which it is worked.

THIS MACHINE CAN BE APPLIED WHEREVER A FALL OF WATER OF A FEW FEET CAN BE OBTAINED, and its cheapness and durability, with the fact that upwards of 500 of them erected in England and other countries by Messrs. EASTON and AMOS have now been at work many years, afford ample proof of its great value and efficiency.

Estimates of the expense of the Machine, Pipes for the conveyance of Water, Tanks, and Reservoirs, may be had on application to Messrs. EASTON and AMOS, CONSULTING ENGINEERS to the ROYAL AGRICULTURAL SOCIETY, at their office in Orange-street, Trafalgar-square, or at the Works in the Grove, Southwark, London.

IMPORTANT TO AGRICULTURISTS.—COLLECTION AND DISTRIBUTION OF MANURES.

STRATTON'S AGRICULTURAL REPOSITORY, BRISTOL.

STRATTON, HUGHES, AND CO., have now ready their PATENT TUMBLER CART for the collection of Night-soil and other offensive matters; also their Iron Mill, to be worked by horse-power, water-power, or steam, for mixing and incorporating Nightsoil with Charcoal and other deodorisers. The Tumbler Cart has an iron body with a close cover; can be fitted if required as a Watering-cart, with a Valve and Delivery Pipe for distributing water or liquid manure, and also with an Apparatus for distributing dry manures in any given quantities per acre.

STRATTON, HUGHES, and Co.'s Tumbler Carts are used for scavenging purposes in Manchester, Bristol, Worcester, Harwich, Rochford, Cardiff, &c., and they are now building them for Chester, Oxford, Huddersfield, &c., besides many for Agricultural Colleges and private individuals. STRATTON, HUGHES, and Co.'s new illustrated Catalogue of Carts, Waggons, and Agricultural Implements will be forwarded to any address on receipt of 1*s.* 6*d.* in postage stamps.

GENUINE PERUVIAN GUANO, direct from the Importer's Stores, LINSEED CAKES, and all kinds of Artificial Manures, may be had at London prices, for Cash, of Messrs. ODAMS and PICKFORD, 15, Mark-lane, London.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

TRUE ITALIAN RYE-GRASS.—A fine Stock of Italian Rye-Grass, clean and true, price 6*s.* 6*d.* per bushel, carriage free to London, Bristol, or Basingstoke. Also best new Clover, Mangold Wurzel, Swede Turnip, Belgian Carrot, and other Agricultural Seeds, at lowest market prices.—For particulars app'y to JOHN SUTTON and SONS, Reading, Berks.

The Agricultural Gazette.

SATURDAY, MARCH 2, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, March 6—Agricultural Society of England.
THURSDAY, — 7—Agricultural Imp. Society of Ireland.
WEDNESDAY, — 13—Agricultural Society of England.
THURSDAY, — 14—Agricultural Imp. Society of Ireland.
FARMERS' CLUB.—March 4: London.

It is a hopeless attempt so to regulate the circumstances of any individual agricultural experiment, as that its result shall represent an agricultural truth capable of more than merely individual application; the only way to arrive at *that* is to ascertain the average of a large number of facts in farming which have occurred under all sorts of conditions, so that the special influences of these may be neutralised in the general result. And if this be the case with facts regarding soils, manures, plants, or farm profits generally, it must be especially true of experiments regarding animals, where, in addition to all those sources of error which affect all agriculture alike, we have that undefinable cause of difference which exists in the peculiarities of temperament. In comparing different breeds, very large numbers indeed must be described, or the conclusions arrived at will be of very little value. And we would, therefore, put the following more in the form of suggestions or questions than as professing any absolute truth.

At the late exhibition of fat cattle in Baker-street, under the auspices of the Smithfield Club, 11 short-horn oxen, in their fifth year, were shown; they had not been restricted as to food; their average dimensions were—girth 9 feet 1 inch, length 5 feet 8½ inches, their average weight, according to CARY'S cattle gauge* was 113 stones. Thirteen short-horn oxen in their fourth year were shown; their dimensions were—girth 8 feet 3 inches, length 5 feet 3½ inches, weight, therefore, 86 stones. Six short-horn oxen in the third year were shown; their dimensions were—girth 7 feet 10½ inches, length 5 feet 1½ inch, weight 76 stones. The question we would ask here is, whether the average in the first and second cases above may be supposed true for sufficiently large numbers to justify any inference from them as to the average growth in the last year of animals of that age and quality so fed. The growth was 27 stones of beef, which would fetch in the market, at present prices, probably one-third of the cost which during that year those animals incurred. We do not ask any such question of the second and third cases mentioned, for the number of animals in each is neither equal nor sufficiently great.

There were also exhibited on that occasion eight Hereford oxen in their fifth year—girth 8 feet 9 inches, length 5 feet 7½ inches, weight 104½ stones: and eight in the fourth year—girth 8 feet 1⅛ inch, length 5 feet 3½ inches, weight 83 stones: and three in their third year—girth 8 feet, length 5 feet, weight 79 stones. The difference between the three and four-year-old oxen is here only 21 stones, yet these animals, so far as one can judge from the printed statement regarding each, were fed as expensively as the short-horns. Compare the two breeds at similar ages: the average weight of the 4-year-old short-horns was 113 stones, of the 4-year-old Herefords 104½ stones, of the 3-year-old short-horns 86 stones, and of the 3-year-old Herefords 83 stones. The Devon breed did not appear in sufficient numbers to render any useful comparison possible. There were, however, eight 3-year-old Devon oxen exhibited; they measured—girth 7 feet 9 inches, length 5 feet ½ inch, and therefore weighed about 72½ stones; considerably less, it will be seen, than either Herefords or short-horns.

May we judge anything, as to the relative precocity of these breeds, from the numbers of the different ages shown? Of the short-horn oxen, 37 per cent. were in their fifth year, 43 per cent. in their fourth year, and 20 per cent. in their third year. Of the Herefords, 42 per cent. were in their fifth year, 42 per cent. in their fourth, and 16 per cent. in their third year. Of the Devons too few were present to render any such statement useful. This appears somewhat in favour of the short-horns; and the result, such as it is, was borne out by the figures obtained at Birmingham, where, of eight short-horn oxen, six were in their fourth year, while of 10 Herefords, eight were in their fifth year. In both of these instances the numbers were sufficient to confer a slight value on the averages of measurement and weight, which were, of the 3-year-old short-horn oxen, girth 8 feet 6 inches, length 5 feet 4½ inches, and weight 94 stones—greater by 6 stones than their weight at Baker-street; and of the 4-year-old Hereford oxen, girth 8 feet 3 inches, length 5 feet 5 inches, and weight 89 stones—less by nearly 6 stones than their weight at Baker-street.

We may also compare the cows of the different breeds. At the Smithfield Club exhibition nine cows or heifers, of the short-horn breed, under five years old, were shown; their average girth was 8 feet 6 inches, their length 5 feet 5 inches, their weight 94 stones: and 13 cows, over five years, measuring 8 feet 2 inches in girth and 5 feet 6 inches in length, weighing therefore 88 stones. Hardly any Hereford cows or heifers were exhibited. At Birmingham, again, of the cows and heifers shown, 16 were short-horns and nine Herefords; but excepting the short-horn cows over five years old, which numbered 10, none of the ages were present in numbers sufficient to compare. Those 10 cows averaged 8 feet 2 inches in girth, 5 feet 3½ inches in length, and were therefore 84 stones in weight—4 stones less than the weight of those shown in Baker-street.

The comparison of the breeds as to prizes is given merely as historically true of the last exhibition, and without any desire to draw inferences from it as to the quality of the breeds; for a single year is certainly no sufficient test. We remark, by the way, that the Smithfield Club is the only society under which this competition between breeds remains possible. All others keep the individuals of each breed to its own class; but if it be at all possible to obtain an unprejudiced judgment of merits in such a rivalry, it is very desirable that the competition between different breeds be extended; and we certainly regretted that the Midland Counties Society had not followed the example of the Smithfield Club in that particular. We find that among 5-year-old oxen, the 1st and 3d prizes, with the gold medal, for the best ox shown, were gained by the Hereford; and the 2d prize was gained by the short-horned breed. Among 3-year-old oxen, the 1st, 2d, and 3d prizes were gained by the short-horn, the Devon, and the Hereford breeds respectively; among 2-year-old oxen, the 1st and 2d prizes were gained by short-horns, the 3d by a Devon. These were the classes in which the three breeds came into fairest competition, and they seem to have effected a pretty even partition of the premiums. It may be interesting, as evidencing how far weight influences the award of the judges, to observe that in Class I., that is, among 4-year-old oxen, the 1st, 2d, and 3d prize animals weighed 111, 132, and 89 stones respectively, the average of the whole that were shown being 102 stones. In Class II. again, among 3-year-old oxen, the 1st, 2d, and 3d prize animals weighed 89, 89, and 82 stones respectively, the average of the whole shown in this class being 88 stones. And in Class III., among 2-year-old oxen, the 1st, 2d, and 3d prize animals weighed 85, 71, and 64 stones respectively, while the average of the whole class was 65 stones. It thus appears that it is held to be a defect not to come up to the average dimensions of the class: but that that alone will not destroy the exhibitor's chance is shown by the facts that in Class I. the third prize was won by what with one exception was the lightest ox there—that in Class II. the three heaviest oxen received no premium, while in Class III., as in Class I., one of the prize animals was below the average weight of those that were shown.

We may also refer to the fact brought out by these measurements, that, in the two classes of animals in which weight is a qualifying condition for competition, some animals were exhibited which undoubtedly ought not to have appeared. The average weight of the class under 80 stones was about 70 stones, but one of the oxen shown in it weighed at least 84 stones, for CARY'S gauge gives results below the truth in the case of fat animals, and the average weight of the class between 80 and 95 stones was about 88 stones, but that there were

* CARY'S cattle gauge does not indicate sufficient weight in the case of very fat cattle.

at least two individuals above 95 and one under 80 appears from our measurements.

We give the above figures as indicative of the sort of truth which a more accurately quantitative report of these exhibitions of fat cattle might ultimately lead us to. It is a great pity that no such record exists of the past shows of the Smithfield club, which, excepting the immediate impulse they may have communicated to feeders and breeders of live stock at the time of their occurrence, have been useless displays, when they might, as the only authorities on such a subject, have by this time given us definite and decided information on the relative merits of our different breeds of cattle.

INSTANCES OF CATTLE FEEDING.—No. I.

1. Forty head of cattle, rising three and four years old; all bought in quite lean; breeds various, Fife, Angus, and crosses.

2. Put up the latter part of September, and sold through the winter and spring, beginning in December.

3. A few fed in stalls, the rest in boxes; three or four cattle put in together; should prefer single boxes; the space for each beast 70 square feet.

4. Cut Turnips or Swedes, 100 lbs. per day to each beast, given in two meals; and also 2 lbs. cake crushed small, and 2 to 3 lbs. of ground grain, consisting of Beans, Oats, Barley, &c., well mixed up with 10 lbs. of one-inch straw chaff which has been thoroughly wetted with cold water before the meal and cake is thrown amongst it, divided into two meals.

Cost per week, cake and grain	2*s.* 0*d.*
Attendance, including cutting chaff by horse-power	0 5
Turnips, at 8*s.* per ton	2 7
Total cost per week	5*s.* 0*d.*

I have adopted the above plan for four years, and find it answer well, but never have tried boiling.

5. Wheat and Barley straw; quantity varies according to its dryness; takes more straw for boxes than the stalls.

6. I have found three Fife cattle rising three years old, fed as above, increase, according to measurement, 122 lbs. each in dead weight during 12 weeks. No allowance made for extra quality.

7. Cattle are much more cleanly and comfortable in boxes than in stalls, if ordinary management is pursued.

Feeding cattle are considered to pay very well in this district if they leave 20*s.* per month when fed on Turnips alone, and even when they receive a small quantity of artificial food during the ripening stages. I have observed lean beasts eat 224 lbs. of cut Swedes daily, besides 5 lbs. of cake, when first put up. When cake and grain are mixed up with chopped straw, a great saving of roots is effected, nearly one-half for the two first months they are fed on Turnips. *R. Russell, Kilwhiss, Cupar, Fife.*

CHRONICLES OF A CLAY FARM.

SECOND SERIES.—No. V.

IT requires no small experience of life, to fully *realise* the often heard and often repeated truth, that everything in this world goes by comparison. When the philosopher tells us that we only know the true value of a thing by the want of it, he does but reassert the same fact, that things can only be known by their opposites A man who has lived all his life in England has no adequate conception of the *English climate*. Including with it that of Scotland and Ireland, it stands alone in the world—in that part of it at least which most travellers visit—the Continental world. Its sudden smiles and sudden tears are something perfectly hysterical. Like some fair maiden who weeps she knows not why—then stops and smiles a bit—a fickle smile—then falls to weeping again; there is no knowing when or where or how, to be up to all her moods. She is the very April among nations. The Barometer, a tolerably steady-going guide elsewhere, she turns into a perfect laughing-stock. *Fourteen* times out of *fifteen*, it is said, she makes him play the fool. He is like an old Pointer—always making a dead set—at nothing:—indicating that which *was*,—and *is* no longer.

Is it a Vice or a Virtue? It does not come for nothing. It has its meaning. It is not sent 'promiscuous-like' to worry and perplex "us fools of Nature," to no object or intent. In her trickiest and wildest and most fantastic frolics, Nature is full of soul, full of deepest, and aye! of most loving *purpose*, man-ward. Under hotter skies, where the flesh of beasts is not so much a food as an unhealthy stimulant to the blood, and where the cool vegetable and farinaceous diet are all that man's strength or warmth or appetite requires, 'cats and dogs' indeed do sometimes come rattling down for days together: but they come in a pack, full cry: or in equally expressive Indian phrase, it pours 'monkeys with their mouths open' when it pours at all. But the gentle English sky alone "rains Turnips:" and English Legs o' mutton, and 'English Roast-beef,' were assuredly concealed behind the veil of centuries, when the first daring mariner that the oldest of Historians tells of was scared back by the 'Fog and *falling feathers*' from the sacred coast of Albion. Far away in the thirsty regions of the South, as sun rolled after sun, in dry and blazing sameness through the sky, unscreened by the mercy of a single cloud, I have gasped and pined for an English *Wetting*—for one day in the most dripping covert—for the murkiest downpour—for the darkest clouds that ever gathered in gloomy Council over a November day, —till the very memory of it seemed, like a dream too delightful to have been *ever* true! And often since, when the very drainers—(and they stand the waters from above the firmament, and under it, pretty well)—have cast furtive eyes up out of their soaking trenches to see if 'the Master budged,' giving sundry hints that 'it's a'most time to *give in*,' I've stood my ground for hours against the welcome fog and shower and darkness, from the sheer inward force of well-remembered contrast, determined to *have it out* with Nature, and come to a final arrangement—a sort of *water-level* with her, for having been cheated out of two or three English Winters. And I sometimes think she has whispered me a secret, in return, about those dark and mis-abused November days—as she is prone to do to those who persevere with her—which have made me prize her, and them, and the land they love, and love, the better; and feel that there is a rough poetry and truth in its iron-grey mists and showers, which has made true of the Farmer what was said of the good and brave man under life's trials:

> "He does not run all helter-skelter
> To seek a temporary shelter;
> For well he knows, each trouble past,
> He's sure to find a HOME—at last!"

It was to some such inward thought I was indebted—and as a faithful chronicler I ought to tell it—for the courage with which, after tossing off the blankets an hour earlier than usual, I threw my window open to—*such* a Monday morning! pre-falsified by the brightest stars and clearest sky that ever closed the day of Christian Rest.

One universal soaking drizzle seemed to have taken secure possession of earth, sky, and the day. The small rain gathering on the trees dripped larger from leaf to leaf, falling in the most hopeless and measured way, taking it *easy* as though for a week's continuance, and no hurry at all about the matter. A single red streak, much too red, lay along one part of the horizon, like a long-drawn smile, pregnant with malicious warning for the afternoon, and killing the faint hope that clings to 'twelve o'clock' as an alterative.

Now for my promised trespasser among the Swedes! No need for man-traps to-day in that quarter, thought I, preparing to meet the foe, with a pair of gaiters that seemed made for the Slough of Despond. The turf-ground weezed and yielded under every footstep, plainly dating back the rain to an early hour of the night, as I made my way to the field; and as my eye scanned its whole space over, the victory of the 'early-bird' seemed assured—when suddenly close to me, from the other side of the hedge, just where the master-drain opened out,—came a ringing "Good morning, Sir!" into my very ear, and Mr. Greening, rising from the bent posture in which he had been scrutinising the Drain, *looked* with mischievous unconcernment the victory he had promised, and accomplished.

"Not deep enough!" quoth he; laconically.

"*Which?*"

"Oh—the Drain—not you: and as for me, I *was* deep enough! You thought the drop o' rain had stopped me: no, no. I like a rainy day, to see this sort o' land. These are laid at three foot? Four's better."

"You really think so?"

"I'm sure of it. But I thought you was all for the deep drain? I heerd so, long afore I tried it."

"And that's why these were laid at *three*. This lower part, up to yonder Oak-tree is the first field I drained: and if you had seen the work I had, to get down *three* feet——"

"Oh! ay, ay! I remember now you mention it. Well, I like the four-foot. But not too wide, mind! I'll allow any man to tell me how deep to drain, if he'll leave me, on my own sile, to say the width. It's a pity to spare a line or two of tiles, to run a risk."

"Well: this is three feet, by twenty-one in width: down the furrows, in fact. And the worst of it is, it drains extremely well."

"'The best,' you mean?"

"The worst!—The good done by the shallow drain has been, in practice, the longest enemy of the deep one. A man who finds his field *improved* by the shallow drain, holds that as *a fact*. When you tell him that double the depth would have more than doubled the improvement, he treats that as a —— a *theory*. A DREADFUL thing, that Theory! I wonder how many who use the word—ab-use it rather,—know the meaning of it. But what say you to the dibbing?"

"Well, they're very reglar: hardly one miss'd. But I don't like to see 'em quite so high out of the ground. I fancy it makes a tough skin, and a bitter one. The drilled uns don't look so reglar, but they seem to hold the ground better. How's it done?"

"By the acre; after the first ridging-up, unmanured; a boy goes first, pressing the dib in with his foot. You shall see it presently; it is held by both hands at the top, with a spoke out for the foot, just above the ball of the dibber, to mark the next distance as its point meets the ground, in drawing it out, sideways, in going along. The hole takes about a half-pint,—more it should be. The women follow with the manure in a sort of hopper, toss a can-full in, which fills the hole, and drop the seed in. It is done very quick; but the mixing of the manure is the great point. You must come and see it done."

"I should like it better for light soils. I doubt its answering so well on this kind," said Mr. Greening, thoughtfully, and poking his stout stick under a Turnip which rose very slowly and reluctantly out of its bed. "What is to be done, Sir, with these Clay Siles!—I like 'em—I own I like the strong sile best—but what 's the use o' liking what don't *pay*? The labour 's double: everything 's double expense on 'em, and the time less to do it in: for drain 'em how you will, you *can not* make winter-work on 'em, as you can upon the light. Now don't you confess that?"

"Ah: thereby hangs a long tale! Chemistry on the Light Soils—*Mechanics* on the Clays! When will that great 'Chapter the Second' begin to open? We have n't quite found out everything yet, Greening! There 's something *to come*, I suspect, upon the Clays, that will startle you and me—wise as we are—some day. 'A thing to dream of—not to tell.' But come—you must put the *Beans*, meanwhile, against the *Barley*."

"Well, that 's true: but that wo'nt match it, I 'm afeard; not by a great deal. Here 's Wheat now down at five-and-thirty! Egad, I *can't give it* away! and I remember my poor old father—and that 's five-and-twenty year ago, in the war-time—as the bushel o' Wheat dropped into the sack, saying to me, '*There 's a guinea*, Ben!' *and* 'There 's another!' as the next fell in; and so it went on. That was *farming*, that was! I 'm blest if I don't think they got their own price, and *ours along!*"

"You 've hit the very truth, I do believe: they forgot to take their share of the *per contra*, when the war was over. They made A WILL, bequeathing that to us; for that, I imagine, will be the end of it."

"What 's the use of making a Will, when you 've nothing to leave? They should have left us another war, and short harvests; that 'ould have done better than any laws, I fancy, to keep up prices."

"Postponed the change, perhaps; not prevented it: it was inevitable some day. The fairer course would have been to have accepted it when it fell due, and begun afresh, with some of those guineas in hand that you speak of."

"Well: it has been but a crumbling wall for twenty years, ever since the war ended, with now and then a bit of a check, in spite of all the laws to prevent it: and these three fair harvests have laid us now as flat as we could lie, if the worst had come to the worst."

"It seems then that to inherit a falling market is worse than to be born into a low one. You're but right. The latter admits of hope; the other is continued miscalculation, and disappointment:—and something worse than either."

"And what's that?"

"I won't tell you till after breakfast! Come you old Grumbler, it's the driest subject in Creation, and will take you three cups of hot coffee to get it down. You shan't come into my Sanctum with those boots—boots! why, they're like barges, sunk to water's-edge! You bring to mind a certain Mr. Demos of old—

> —"'Twas ask'd through all the quarter,
> Came you in *Boots*, Sir, or in *Boats*—
> By *Land*, Sir, or by *Water*?'

off with 'em! they shall be cooked, under the mutton chops, and come in again with the muffins. You're in close custody; so peel off that patrimonial-looking great-coat, and send it after the boots. Why—it's as heavy as—those same guineas! I'll be bound the lining's stuffed with 'em!" [Mr. G. eyed it over, and shook his head, smiling grotesquely.] Well! come along—you shall abuse the Foreigners and Free-traders over the first two cups, and we'll drink 'Better prices for '36!' over the third." *Talpa.*

BRICK AND TILE MANUFACTURE.

THE chief considerations in choosing the situation for a brick-yard are, that it should be central, near a good road for bringing coals, on a bed of good clay, and with an absolute command of water; if these four considerations are complied with, the situation is all but perfect; to make it quite so, let it be on the side of a declivity facing the south-east, and sheltered from all quarters but that. Among all these the only condition that I make compulsory is that implying good clay; water, if not issuing from a spring in the yard, may with a little foresight in the winter be secured in the pit for the summer months. A bed of sand is valuable, and a bed of limestone desirable also in a brick-yard; the sand is useful in making clay goods, and both are obviously necessary for building. Lime burning is carried on with much economy in a brick-yard.

Much need not be said of the external indications of a bed of good clay, as such as is fit for making seldom comes to the surface. The best clay for keeping to its size when burnt, and for smoothness of texture, is found generally under a sand or sandy loam—a day or two with a good drainer, spade in hand, digging trial pits, and a little exploring along side ditches, and on the sides of watering pits or ponds, and half an hour's conversation with the nearest well-sinker, will do all that is necessary. Having decided on what is considered the proper situation, a pit may be sunk into the clay for the purpose of giving it a more careful examination. For pipe-tile making it should be thoroughly free from stones, particularly lime-stones, however small they may be, even as small as Tare seeds, and it should be of a smooth texture when worked in the hand; no clay with square "dicey" dry lumps in it is proper for tile-making, unless ground, pugged, or washed, which adds materially to the expense of production.

The nearer brick-clay approaches to the character of tile-clay the better, but it need not be so smooth or so free from stones, save and except always lime-stones or fossil shells burning to lime. In many places, under the cultivated soil and subsoil, and between that and the clear clay, is found an intermediate vein, partaking in colour and texture of the nature

of both its neighbours; thus if a red oolitic soil be on the surface, and blue clay below, or green sand above and gault below, there will probably be found in either case, as an intermediate stratum, a yellow loamy clay of from 1 to 4 feet in thickness; if this is free from stone it is a treasure, not a pound of it ought to be wasted, though many brickmakers cast it all with the spoil or waste. It is desirable to keep all goods, when burnt, as nearly of the size they were made as is possible, but many clays shrink in drying considerably, and this intermediate vein generally furnishes the means of partially obviating the calamity. If then, in the trial pit, there is this loamy clay, and under that 5 feet of good clear clay, blue or otherwise, there exists all that can be required on the score of clay. The depth to which it may be thought advisable to remove it cannot and need not be here decided on; 3 feet of spoil to cast away and 6 feet of clay to use is a very convenient arrangement for private yards; it has the advantage of frequently allowing the land to be drained and cultivated after the removal of the clay.

Having fully ascertained the presence of the material, the next step is to make arrangements for working it. In coming to a decision as to the relative spots on which to place the kiln and tile shed, let the former, if the yard is on a declivity, be at the lower end, and the latter across the declivity, if it is a sharp one, and so placed as not to interfere with any future digging of clay. The shed ought not to be more than 22 yards from the kiln, and the side of it should form part of the fence to the yard. For the manufacture of 1,000,000 pipe tiles, and about 150,000 bricks, a plot of ground, with a bed of clay of 6 feet thickness, containing the third of an acre will amply suffice; for example, 33 yards wide and 66 yards long. The raising of the clay may be begun before any fence is put up at that end of the yard which is the farthest from the proposed kiln, and adjoining the proposed shed. Brickmakers are proper for the work, as it is one requiring great care and some knowledge of brick earths; and even brickmakers must be constantly watched, or the clay will not be found clean in the summer. The bottom clay will probably be that least proper for tiles, from its containing dicey indigestible particles; let that when dug be kept in the pit for brickmaking, and let the loamy clay, and all that is approved and desired for tiles, be barrowed across the top of this brick clay, and deposited two feet or a yard thick as near to the proposed shed as circumstances allow; the vacancy that will finally occur in the pit from the removal of the tile stuff, and from flinging the brick clay together on one side, will, if there be no spring issuing in the yard, hold the water for the summer. There will then be brick clay in the pit, and the tile clay will be on the surface, between the end of the pit and the shed.

It is hardly possible to give any general rules for tempering of clay in winter; common sense and observation on the spot must direct this. Gault and gault-like clay requires turning over (and watering in the process) twice to make a good brick; tile clay of this nature needs it but once, as it must afterwards go into the pug-mill. Water is the great digester of all clays, and it may be noted that in turning clay, by heaping it high (six feet, if possible), it will come down with the water almost as fast as it is flung up, producing a settling that has a crunching effect on the mass; occasionally the skirts of the heap should be cast into the middle. The best covering to protect the heap from summer sun is very old rotten thatch or rotten stubble. Sand has been suggested, though I have never tried it; which sand, if the clay is devoid of any material quantity, may be mixed with it to advantage. The object of winter preparation is to thoroughly wet the whole mass of clay raised, and so to soak it that in cutting it down with a shovel it shows a surface of even texture. If turning, watering, and the action of frost will not effect this, the summer preparation to be afterwards described will do so, though at greater cost. *A. P.*

(To be continued.)

MR. MECHI'S LIVE STOCK ACCOUNT FOR 1849.

Dr.			
Grazing stock in hand 1st Oct., 1848, valued at the then market prices	£621	0	0
Ditto, purchased from 1st. of Oct., 1848, to 1st of Oct., 1849	306	17	0
Corn, hay, straw, Linseed, &c., bought	1037	4	6
Coals, millers' wages, repairs to engine, &c.	128	2	9
Labour, feeding and attending stock	50	0	0
	£2143	4	3

Farm produce consumed in addition to the above.

17 acres of Mangold Wurzel, 340 tons.
6 acres of Swedes, 90 tons.
8 acres of Rye and winter Oats, fed off.
4 acres of winter Tares, fed off.
13 acres of spring ditto, ditto.
6 acres of Clover hay, 10 tons.
20 acres of Clover, after feed.
5 acres of poor pasture.

79 acres.

Cr.			
Grazing stock in hand 1st of Oct., 1849, valued at the then market prices	£569	18	0
Cash received for live stock sold and slaughtered	1067	16	3
Cash for wool	24	1	6
Butter, poultry, eggs, milk, and cream	25	0	0
Cash received for Barley-meal sold	84	4	11
Hay, corn, &c., consumed by two nag horses, visitors' horses, &c.	75	0	0
Keep of eight farm horses out of purchased corn and hay	210	0	0
	£2056	0	8
Charge against manure kept	87	3	7
	£2143	4	3

The foregoing account shows a charge of 87*l.* 3*s.* 7*d.* for the manure, to which must be added the cost of cultivation and charges on 84 acres of green and root crops, which cannot be estimated at much less than 336*l.*, making a total charge against the future productions of the farm of upwards of 400*l.* In ordinary seasons about 100*l.* might be taken from this, because there was a diminution for depreciated prices of stock to that extent between the valuation of 1848 and 1849. On the other hand, the interest for capital invested would be an additional charge of 50*l.*

I should observe that I have been very fortunate in the management of my live stock, my losses from disease for the year being under 10*l.*

Now, is this stock account a satisfactory or unsatisfactory one? Let us see. We have 56 acres of green crops fed off with corn and Linseed, therefore sufficiently manured for the rotation; and we have 23 acres of root lands to manure. But what have we besides to pay for the 87*l.* 3*s.* 7*d.* lost in feeding out corn, &c.? Let us see.

700 quarters of Barley, Beans, Peas, Linseed, &c.,	Tons.
5 quarters to the ton	140
80 acres Wheat straw	100
12 acres Pea and Bean do.	18
Straw purchased	35
Hay do.	19
Hay, home grown	15
Bran and pollard, about	15
Dry tons	342
Mangold Wurzel and Swedes	430
Tons	772

Besides the ashes of 30 tons of coals used by engine, and the blood, &c., of hundreds of pigs, &c. I am not calculator enough to say what quantity of manure this should produce, but judging from the quantity I have carted, it is not less than 1200 tons, or carts, besides a considerable quantity of liquid, not a hogshead of which has been allowed to run to waste. However, it is quite clear that the essence of 700 quarters of corn, and other good things, will *tell* for years to come. It is only those who have witnessed the durable effects of good unwashed manure on tenacious and deeply cultivated soils, who can appreciate its value. I do not believe I could purchase and cart an equal quantity and quality of manure for 600*l.* For instance, my neighbours pay 17*l.* to 20*l.* a freight for London dung or sweepings, which is 6*s.* to 7*s.* a ton, without carting. I need hardly say that my land is in condition to carry out good crops, and no doubt will continue to do so, although naturally miserably poor, and although I crop half of it every year with Wheat.

It appears by my statement that after deducting the cost of live stock bought, that the actual money value of meat made and sold during the year was 710*l.* Now, I was curious to know how much per cent. of this was realised by my bullocks, sheep, and pigs. I easily ascertained it as follows:

Bullocks.			
Valuation, 1848	£249	Valuation, 1849	£127
Bought, 1849, none.		Sold, 1849	129
			286
	£249		249
		Increase	£37

Sheep.			
Valuation, 1848	£153	Valuation, 1849	£195
Bought, 1849	179	Sold, 1849	232
			427
	£332		332
		Increase	£95

Pigs.			
Valuation, 1848	£218	Valuation, 1849	£247
Bought, 1849	128	Sold, 1849	676
			923
	£346		346
		Increase	£577

So that in fact,

346*l.* in Pigs, produced over and above their cost			£577
332*l.* in Sheep,	do.	do.	95
249*l.* in Bullocks,	do.	do.	37
			709
Wool from Sheep			24
			£733

A pretty serious comparison of investment, but a true one. If my 581*l.* capital, instead of being in sheep and bullocks, had been in pigs, it would have made a very enormous difference in my favour. Of course we cannot all keep pigs, but whence does this great discrepancy arise? The sheep and bullocks ate up nearly all my root and green crops, hay, &c., and in addition a large quantity of meal, &c. The pigs had only corn meal, with a few roots. The breeding sows, pollard, corn, and roots. I breed nearly all my pigs. The sheep were folded during the summer, but in winter on Mr. Huxtable's boards, where I mean for the future to keep them entirely, as I can find it makes all the difference in their progression. (By-the-bye, sheep on boards want shearing much earlier than in the open fields, or they will not do well in close quarters. They must also have water.) I assume that pigs, sheep, and bullocks all ate in proportion to their weight and value, as they were not stinted. We know there was a ruinous depression in bullocks, and a considerable reduction in sheep. I see a great deal of my pork was sold at 5*d.* and 5½*d.* per lb. during summer. All my pigs and breeding sows are kept close confined in the yards summer and winter, and I will take especial care henceforth that my other animals shall not have much exercise.

In conclusion, I am satisfied there is nothing like plenty of stock. Bullocks, as I said before, are ungrateful fellows, and I do not wonder at it, for no gentleman eats shoulders or necks of beef although they do of mutton. I am also quite satisfied that our root and green crops must be made secondary and subservient to the larger consumption of corn or cake. In fact, I sincerely believe, from my own practice, that Mr. Huxtable is right, both in keeping his animals without exercise, breeding them at home, and feeding them bountifully. I may perhaps some day trouble you with an account of my management of pigs.

My object in publishing the foregoing account, which is a faithful extract from my books, is to show the means I am adopting for bringing my land into a fertile state, and to elicit from others such information as may be useful. It is quite clear that the corn side of our farms, if charged merely with the expenses of the year, is satisfactory in its return; but when we cannot make the green and root crops pay their own expenses, the loss or difference is a heavy tax on the succeeding corn crops. I see in Mr. Hewitt Davis's farm-accounts, published in the "Royal Agricultural Society's Journal" (Vol. VII., Part II., page 532), he charges the loss on the Turnip crop, fed off, at 6*l.* 9*s.* per acre, and on the green crop, 1*l.* 9*s.* 6*d.* Whether by Mr. Huxtable's plan we shall succeed in reducing that loss remains to be proved—I am trying it. One thing is certain, that, as our liquid and solid manures are so costly to produce, the notorious national waste of them is a ruinous prodigality—scarcely an act of sanity, and certainly one of most miserable miscalculation. Landlords and tenants must really lay their heads together to remedy this defect. *J. J. Mechi, Tiptree-hall, near Kelvedon, Essex, Feb. 2.*

Home Correspondence.

Draining is a subject which may claim the attention of farmers at all seasons of the year, and no doubt any enterprising tenant who has the "wherewithal" to do it, or is assisted sufficiently by his landlord, does direct a very considerable portion of his regard to this fundamental part of his business; but, although nearly every farmer has dabbled in draining more or less, and labourers pretend to know how to execute the work, yet there is a lamentable want of knowledge of the first principles of the art shown by the greater part of those engaged in ordering, planning, or manipulating the process. Landlords are heard of who, having some cash to spare, firmly believe they are improving their own property, and acting like benefactors to their tenants, by undertaking a system of drainage for which the occupiers are required to pay 4 or 5 per cent. upon the outlay, and if the work was done properly it might prove a beneficial arrangement for all parties; but the landlords themselves rarely take much pains to master the subject so as to determine rightly what depth can or ought to be obtained, the distance between the drains or their direction, the size or quality of the tiles, how to cover them, and other material particulars. If the owner has not the ability or resolution to plan or direct the proceedings rightly, still less is it likely to be done thoroughly by the present race of stewards or agents, whose qualifications seemed to be too often summed up in keeping accounts, extracting rent, and evading all expenses until dilapidation increases the liability fourfold; it need not therefore be a matter of surprise to hear a tenant assert, when he was charged 4 per cent. upon the cost of drainage, that it was equivalent to more than 7 per cent., considering the difference in expense and efficiency if the management had devolved upon him. Still it must be admitted that the first attempts of tenants in the art of draining are rarely so successful as might be desired, however careful they may be to expend their money with a watchful eye to economy and efficiency; and who can chronicle the abortive efforts of ignorant men who storm at the capital they have engulfed by draining too deep (yes, Mr. Mechi, they would tell you at Wood, Walton, or Sawtry, in Huntingdonshire, that you *may* drain *too* deep in their unfathomable and impervious gault!) or too shallow, by using inferior or unappropriate material, by inattention to the outfalls, or by not securing a regular fall in the land experimented on, and so fail in reaping a benefit corresponding with the money expended, and then they ever after feel they have earned a right to abuse science, new-fangled notions, and book-farming! There are four parishes near Peterborough in which draining has been carried on for nearly 20 years, from thorns and turf to stone and tiles, improving in plan, increasing in extent, and dug by better men, with better tools, each succeeding year; and what have they arrived at now? after some of the farmers positively having laid drains twice over in the same fields, they have at last acknowledged that the brook connecting the parishes, and which acts as a common outfall, requires to be kept at a lower level; and a project was I believe agreed upon two or three weeks since to have a steam-engine erected, which will pump the surplus water of the brook into the Welland river when required, and so effect an immense improvement. How many parish drains are there requiring to be deepened, straightened, and drained, that now occupy in their sinuosities three times the space they should do, frequently swamping a deep and valuable alluvial soil, as choked with overhanging trees and briars, grass and rubbish; perchance a tunnel stopped up or other modes of obstruction; pity that some cheap process could not traverse a county and compel some amendment in the management of parish drains, and at the county's expense; for the accident of a parish being located at a lower level increases both the cost and the necessity of constant attention to the outfall. *J. W., Peterborough.*

Beer.—The best advice I can give your correspondent who complains of acidity in beer, is to procure Black on Brewing, a 7*s.* book, to study it attentively, and follow Mr. B's. directions precisely. A common glass saccharometer (costing about 7*s.*), is almost necessary to ascertain the progress of fermentation, as well as the original strength of the wort. I suffered long all the evils of which "Cerevisium" complains. I have now attained perfectly sound and very excellent beer. My success arises entirely from having sat in my brew-house book in hand, and carefully followed Black's receipt. "Cerevisium" would do well to see that his under-back and coolers are thoroughly sweet; if there be any doubt about this, they should be soaked for 24 hours with lime-water, and afterwards well rinsed. The raw hops introduced as finings, I suspect are mischievous; I never use them now, but they are a favourite nostrum with some old hands. Of course I do not mean to say that beer brewed according to Black's directions will resist the effect of thunder, but all I can say is, I never had sound beer till I adopted his receipt, and I have never had any unsound beer since. One suggestion I will make which I think does not occur in Black's book, viz., that the mash tun should have a close fitting wooden cover, this saves some 10 per cent. in malt, and may have other advantages. If there be any point to which attention should be directed more than another, it is to the completeness of the fermentation. I use a pint of strong yeast to every bushel of malt wetted, and ascertain by saccharometer that the fermentation has been carried far enough. Black's instructions on this head are very full, but it may be well to call attention to them. *Barleycorn.*

Norfolk System.—In your Paper of February 9, Mr. Davis proposes the 4-course Norfolk shift as an improvement on Mr. Watson's 5-course shift. As far as Scotland is concerned, he appears to overlook that there it is necessary to manure for Wheat as well as green crop. By the 5-course shift, say 15 loads for 40 acres of Wheat, and 25 for 100 acres of Turnip = 3100 loads at 3*s.*, = 465*l.*; by the 4-course, say 15 loads for 125 acres of Wheat, 1875 loads, and 25 do. for 250 acres of Turnip, 6250 do., = 8125, at 3*s.*, = 1218*l.* As under the 5-course there are 300 acres under labour, and Mr. Davis's 4-course there are 500, has he not under-rated the expense of keep and labour? *G.*

Hybrid Pheasants.—If "N. F." will take the trouble to write to the Duke of Buccleuch's gamekeeper, at Langholm Lodge, Dumfriesshire, he may be likely to get the proper information respecting the breeding of hybrid pheasants; let him not rest contented, by supposing that such a thing is impracticable. I can assure him that it has been done 30 years ago, by the late Mr. Hardie, who was then and had been for many years gamekeeper at Langholm Lodge. It can hardly be supposed that the birds which Mr. Hardie reared at that time are still to be seen there, but it is likely that his successors have kept up the stock, or may have made themselves acquainted with Mr. H's. plan. I remember the birds well, they generally kept amongst the poultry, and would often attack the domestic cock; one bird in particular, which was much stronger than the rest, would always come upon the cock unawares, and hit him nearly heels over head, the poor cock would turn round, but could never catch hold of his more agile assailant, who would put himself in a fighting attitude for a minute or two, but would never rise to strike at the same time with the cock, which always flew over the mule's head without touching him. They were of different colours, some speckled white and brown, others yellow on the back, with black necks, breast and tails, larger than the common pheasant, which they resembled more than the domestic hen. *W. S.*

A Steam Cultivator.—Please to insert these few lines in your *Gazette* as a foreshadowing of what a steam plough, or rather a steam cultivator ought to be, and, I make no doubt, will ultimately be. I am no mechanic, but I know enough of mechanics to be aware that there is nothing in my proposal which skilful engineers cannot contrive. I propose a machine, somewhat in the shape of the patent street-cleaner; it would, however, be much larger in front; on being moved forward, it would take up the whole of the soil, which is to be pulverised. This would be moved upwards into the body of the machine, to be reduced by means of cutters, rollers, sieves, and other appropriate contrivances, to the state most suitable for the growth of the intended crops. The manures proper for the occasion, according to the most scientific principles, might be mixed with the soil, and the latter would then be deposited at the other extremity of the machine, in one broad sheet or layer, on the land, somewhat in the manner in which cotton comes out of the carding machine. There would be no difficulty, if desirable, to mix the seed at the same time, with the soil in the machine, or to drop it from the machine, and cover it with a second sheet of earth, and press the latter down with rollers, all in one operation. This ponderous machine ought to be 8 or 10 feet wide. It would be pulled to and fro across the field by steam-engines, moving along the two opposite sides on temporary rails. The wheels on which the cultivator would move ought to be so contrived that they should cut ruts, serving at the same time as surface drains, and also as paths for the weeders, who would have to preserve crops—sown with so much care and at so great an expense—from all injurious vegetation. The business of ploughing, manuring, and sowing, would become a separate trade; the proprietors of these machines, with their men, would travel over the country, and hire themselves out, where wanted. Agriculture would then become, indeed, both an art and a science. Instead of decreasing, it would increase the demand for labour, and the labourer would be advanced in the scale of society. I repeat that all this can be accomplished, and I make no doubt it will. Progress is the order of the day. We cannot stand still. We may not retrograde. Here is a proposal to advance. *P. S.*

Steam Engine.—I am induced to send you an account of what, since my last communication, I have done to my steam-engine, and I shall be pleased if it should benefit any person that has or is about putting up one; but I must first give you the particulars of my threshing-mill, to enable you to judge of the improvement; it was at first worked by four horses (who felt more fatigued after a day's threshing than when in pairs they had ploughed 1¾ acre of lea land); its drum is 4 feet long, and 3 feet 3 inches in diameter, and made 290 revolutions per minute; the edge of the beaters then travelled at the rate of 35.525 feet per minute, the rollers being 5 inches in diameter, made 71 revolutions, or their circumference going over a space of 1115 feet. This speed I give to calculate how long a sheaf of a given length is being held to the beaters; the engine now drives the drum 440 revolutions and the rollers about 110; the edges of my beaters now go 53,900 feet per minute, yours at Whitfield about 50,000 feet. Would you advise me to take away the rollers, and adopt the most approved concave to suit my drum, or adopt the peg system, as you will see how much longer a sheaf is in contact with the beaters, and how much power the rollers take to hold it there. [What do you thresh now—How many cubic yards of a six months old rick?] My steam cylinder is 9¼ inches in diameter, and the ports at first were 4 inches by ¾, and there was no more lap on the valve than allowed the steam port to open, just at the time the eduction port opened; this caused great back pressure, and required the steam to be about 55 lbs. pressure to work the mill, the passages being 4 inches by 1, the ports were enlarged to that size, and put as much lap on the valve, that when the steam port was opening, the eduction port was two-thirds open; the engine worked much better with only 40 lbs. pressure. From its success, I had new passages and ports made, 6 inches by 1¼, and the middle port 6 by 2, when its work was improved when only working with 30 lbs. pressure, and a further saving of fuel; but I found that to lift the enlarged valve when the pressure was 25 lbs. on the inch, it took 380 lbs., and to remedy which I had a 4-inch cylinder with a packed piston screwed on to the front of the valve chest, so connected that it pulled against the back of the valve; this so far relieved it that the engine started well to its work with 25 lbs. pressure, the adopted piston so far relieved the pressure on the valve that it took 190 less to lift it. The pressures mentioned were what I was obliged to get before the engine would work for any length of time, but after a short time the pressure decreased, and the engine went slower; but at my yesterday's trial I commenced when the steam was at 25 lbs., and it gradually increased to 30 lbs., when I opened the communication to the bone steaming boiler, and was steaming bones all the time I was threshing. *Richard Nicklin, Isle of Man, Feb.* 9.

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

Professor Way, the Consulting-Chemist to the Society, delivered a Lecture "on Guano and its adulteration," before the members of the Society, at their House, in Hanover-square, on Wednesday last, the 27th of February; Mr. Raymond Barker, Vice-President, in the chair.

LECTURE ON GUANO.

Mr. Way commenced his lecture by observing that he had been induced to make guano the subject of a lecture, partly because the present was the season when farmers were purchasing their supplies of the manure, partly on account of the insufferable extent to which the adulteration of guano was now carried, and which had been brought before the attention of the Council of the Society in so circumstantial a manner at a previous weekly meeting, as to induce them to refer the whole question to the serious consideration of a monthly meeting. Mr. Way would carefully avoid any remarks which should have the appearance of prejudging the case, or of dictating to the Council the line of conduct they should pursue; but he considered it his duty, as the Chemist of the Society, to bring the facts before them.

He should confine himself to Peruvian guano, the other varieties having comparatively ceased to be of importance; and 1st, he would endeavour to establish the fact, that the true Peruvian guano, as it reached this country, was not subject to much variation. By the examination of more than 30 specimens last year, he had found that the per-centages of ammonia and phosphate of lime, the most important ingredients of guano, were confined within narrow limits. A diagram before the meeting showed this plainly.

VARIATION IN THE COMPOSITION OF PERUVIAN GUANO.
(32 specimens examined.)

	Lowest.	Highest.	Mean.
Water	8.88	22.68	13.09
Organic matter and salts of ammonia	37.78	58.82	52.61
Sand	1.17	2.95	1.54
Earthy phosphates	19.46	34.45	24.12
Ammonia yielded by 100 parts	15.98	18.94	17.41

The specimens alluded to were carefully taken from ships in the river. Since the publication of these results in the Journal of the Society, he had made many more analyses of good guano, and was more than ever convinced of the uniformity of its composition. But whilst the authenticated specimens were very similar in composition, samples were continually reaching the laboratory, which, upon analysis, exhibited every shade of chemical characters—that these samples were adulterated, there could be no doubt. While good guano, when burnt, gave an ash almost entirely soluble in acids, and leaving only 1½ or 2 per cent. of sand, these adulterated specimens contained often from 25 to 35, or more, of insoluble matter—sometimes sand, sometimes clay. In proof of this, he submitted, in a diagram, the analysis of six specimens which had reached him within the last few weeks from different localities.

ADULTERATED GUANOS.

	1.	2.	3.	4.	5.	6.
Water	7.77	6.64	...	10.92	12.32	11.22
Organic Matter and Salts of Ammonia	36.18	29.42	...	32.44	34.86	34.68
Sand, &c.	23.14	7.84	25.34	32.50	27.23	5.44
Earthy Phosphates	6.80	10.24	16.40	10.60	13.30	21.09
Ammonia	10.10	8.37	12.20	10.29	8.96	27.57

In many cases these specimens had been sent to him in the belief that they were genuine, but there could be no hesitation in pronouncing them spurious. Of the loss to the farmer in the purchase of such sophisticated manures it was difficult to speak with any great degree of accuracy—the loss was not confined to that of the purchase-money—it was the disappointment and failure in the crops resulting from their use which constituted the severity of the evil. Of the loss on purchase-money, some notion might be formed by a calculation founded on the value as manures of ammonia and phosphate of lime. He estimated the ammonia at 6*d.* per lb., and the phosphate of lime at ¾*d.* per lb.; but it would be necessary to make a deduction from the value so obtained, inasmuch as guano at 10*l.* per ton furnished these substances at about one-sixth less than the above-named prices.

MONEY VALUE OF ADULTERATED GUANOS.

		Per cent.	Price. £ s. d.	Value. £ s. d.	Loss to Buyer. £ s. d.
1.	Ammonia	10.10	8 10 0	5 9 0	3 1 0
	Earthy Phosphates	6.80			
2.	Ammonia	8.37	7 10 0	4 10 0	3 0 0
	Earthy Phosphates	10.24			
3.	Ammonia	12.20	9 10 0	6 12 0	2 18 0
	Earthy Phosphates	16.40			
4.	Ammonia	10.29	.....	5 18 0	.....
	Earthy Phosphates	10.60			
5.	Ammonia	8.96	.....	5 14 0	.....
	Earthy Phosphates	13.30			
6.	Ammonia	8.14	.....	6 4 0	.....
	Earthy Phosphates	21.09			

The diagram which was formed from the analysis of the specimens just described, proved that whilst the dishonest dealer reduced the value of the guano by sand and other admixtures, to one-half, he only lowered the price by one-fourth. For 7*l.* 10*s.*, the farmer obtained, therefore, a guano which was intrinsically worth 5*l.* or less. It could not be too widely known that it was impossible in the general way of business that they should buy good Peruvian guano for less than 9*l.* 5*s.*, because the importers, Messrs. Gibbs, Bright, and Co., who had an exclusive agency from the Peruvian Government, never sold any sound guano below that sum. It was true indeed that there were sales now and then of damaged guano; that is, of the parts of the cargoes that had been subject to leakage on the voyage; but the competition for these lots was so great that they generally fetched a higher price than their intrinsic value justified; they were often mixed with some substance to dry them up, and then the farmer paid the cost. Nothing was a greater delusion than a cheap guano; if the farmer could not afford the full price, let him buy half the quantity.

Mr. Way then went on to mention the substances generally employed in the adulteration, and to remark that at present the methods employed were very gross, and comparatively easy of detection — yellow sand, ground limestone, yellow marls and clays, gypsum and ground coprolites; all and each of these had been detected in the analysis of samples he could bring forward. The adulteration was not confined to 10 or 15 per cent., which itself would seem to offer a fair remuneration for the fraud, but it was in most cases above 25 or 30 per cent. The use of ground coprolite was a certain step of refinement in this nefarious trade, because the coprolite consists in great measure of phosphate of lime—itself an ingredient of genuine guano. By-and-bye he feared that those who adulterated, being more closely watched, would become more clever in their calling, and the little chance (for unfortunately it was little) that the farmer, unaided, had of discovering the imposition would be still further diminished. He wished he could make known some easy and simple method by which the buyer could, for himself, make an examination of his purchases; but there would seem to be none short of chemical analysis, which met all cases.

The lecturer then went on to show, by specimens on the table, the difficulty of deciding between a good and bad specimen by external indications. The colour was usually considered a criterion, but a sample exposed for a short time to damp air, became dark and of a suspicious appearance, although in truth perfectly good, and really only containing 2 or 3 per cent. more water

On the other hand, guano adulterated with 40 per cent. of yellow clay, was in no respects distinguishable by its colour from the pure article. On the table were specimens purposely mixed with 10, 20, 30, 40, and 50 per cent. of white sand. This was a gross falsification, and yet he thought that gentlemen in that room would have a great difficulty to distinguish between any one of them containing less than 30 per cent. of sand and the pure guano lying beside them. The character of smell was also very deceptive. No doubt the pungency was reduced by mixture with most substances; but even good guano was not all alike in this respect; and if by accident it became slightly damp, the smell was greatly increased. The driest and the best, would therefore frequently have the least odour. Perhaps of all practical tests that of specific weight was the best. Adulteration was happily at present practised with substances heavier than guano, and therefore a great weight compared with equal bulk was a suspicious circumstance. By a great many weighings made under the directions of the importers, he was able to say that the average weight of a bushel of good Peruvian guano was about 68 lbs. The variation on these trials was, however, somewhat great—a bushel sometimes weighing as much as 73 lbs., at others not more than 61 lbs., a circumstance due to the lumpy and unequal character of guano, and to different methods employed by various persons in the experiment. A bushel of guano adulterated with 40 per cent. of any of the substances he had before named, would, however, greatly exceed the above weights, although he could not state the precise difference. Some value was, therefore, to be set on this method of judging, although eventually he feared it would not serve the purpose. Some simple experiments were in the reach of every farmer, and would serve to protect him against the more flagrant modes of falsification. Thus, when pure guano was burnt on a hot shovel till the blackening had gone off, the ash ought to be white—not yellow or brown: these latter appearances indicated an admixture of clay or coprolite. The ash, too, ought almost all to dissolve up in muriatic acid, leaving little residue insoluble.

A still better plan was to burn 100 grains of the sample with twice its weight of powdered nitre, and when the mass had ceased to swell up to dissolve the nitre in water. If pure guano had been used, the white phosphate of lime would easily float off in the water when decanted. On the other hand, a mass of yellow or black heavy stuff at the bottom of the glass would lead the experimenter to suspect adulteration. Having expressed his regret that the circumstances did not admit of an easy and certain test of good guano, to be applied by the farmer himself, Mr. Way said that it was some satisfaction that the fraud was open to detection by the aid of chemistry. There were numbers of chemists throughout the country quite competent to decide in these cases, and the farmer who purchased largely of guano without having recourse to the unerring guidance of analysis, was himself partly to blame if he lost his crops and his money. The Council of the Society had made arrangements by which the cost of analysis of all sorts to its members had been considerably reduced. If they should be able to strike out any plan by which the access of farmers to chemical aid would be facilitated and cheapened in regard to this particular manure, he was prepared on his part to co-operate with them in any way that his professional assistance might be useful.

Lastly, Mr. Way would advert to the practical result which might flow from a more general employment of analysis in the case of guano. Could the farmer refuse payment for an adulterated guano? or, could he recover from the fraudulent dealer for loss of money and loss of crop? These were the great questions. He did not profess to understand the law of the case, but he could not conceive that, in a common-sense country like England, deliberate fraud affecting the vital interests of a mass of the community could be allowed to flourish unchecked, and he believed, sooner or later, whatever the difficulties, the farmer would find his redress. Mr. Way stated that it had always appeared a difficulty to him how, in case of his being called upon to give evidence in a court of law, he should answer such a question as this, "You say that this guano has a different composition to the average cargoes, and therefore it is adulterated—have you analysed every cargo that has reached England during the last year?" This would be a troublesome question to answer, however much he might morally be convinced of the adulteration. This difficulty had, however, been entirely removed by a promise which he was authorised to make on the part of the importers—that samples of each cargo of Peruvian guano reaching England should be reserved with all proper authentications—not by persons in their employ, but by independent witnesses producible in a court of law, and that portions of these samples should be available for the establishment of any case of fraud. This arrangement was a great step. Let the farmer always insist upon knowing from the dealer the name of the ship, and the date of importation, and with a power of reference to the original cargo, the links of legal evidence would appear (at least to him, as a person unlearned in the law) to be complete.

Before he sat down, Mr. Way wished to say that in attacking the unprincipled dealers, he would distinctly express his conviction, that there were very many honest and upright men from whom guano could be purchased, and it was hard that the just should suffer for the unjust. The dealers had in great measure introduced this valuable manure into use, and should not hastily be deprived of their rightful advantages, because there were some black sheep amongst them.

On the motion of the Rev. James Linton, seconded by Mr. Slaney, M.P., the best thanks of the meeting were voted to Professor Way for his kindness in lecturing before them on that occasion. Colonel Challoner, Captain Wentworth Buller, Mr. Miles, M.P., Mr. Parkins, and Dr. Calvert, offered remarks to the meeting on topics connected with the lecture, and Mr. Barugh Almack suggested that an authorised list should be published of those dealers who had never been known to offer adulterated guano for sale.

Review.

The Plantation Scheme: or the West of Ireland as a Field for Investment. By James Caird, Farmer, Baldoon. Blackwood and Sons.

Mr. CAIRD spent the greater part of last autumn in examining the condition of Irish land, and Irish cultivation in the west. The idea and prosecution of this investigation were entirely his own; he obtained indeed the character of Sir Robert Peel's commissioner, by newspaper report. But he neither possessed, nor did he profess any claim to the title. This examination of estates in the counties of Mayo, Galway, Clare, Limerick, Kerry, and Cork, was undertaken originally for his own information, and the tour proved so interesting and instructive to himself, that it was thought its publication might in some degree supply the agricultural information in which other "tours" had been deficient, and hence the present volume. We do not mean just now to give any lengthened description of it, though we shall publish occasional extracts from its pages. It must suffice for the present to say, that it is a simple unpretending detail of what was seen by an intelligent practical farmer, who by introductions from the Lord Lieutenant, Sir Robert Peel, and others, enjoyed opportunities of information which other travellers have not experienced, and that it will no doubt be read with interest by any who may propose investing English capital in Irish soil.

Miscellaneous.

Atomic Character of the Food Manufacture.—It is not merely that the extra manuring induces the extra crop—the manuring furnishes the very building material out of which the increased produce is made. Those very atoms of nitrogen and of phosphorus you are adding in guano—those very particles of potash and soda you are detaching from impracticable positions in the soil by the influences which drainage has brought to bear upon them—those very atoms of carbon which your plants, vigorous owing to more thorough cultivation, are extracting from the air in the sunshine, may travel various roads, but they will come to an ultimate residence side by side in the flesh and the blood of the fattening animal. The various additions you make to your soil, the fertility you extract from it, may indeed be said to "occasion" the increased produce of meat which succeeds them, but it is in the same way as the stone and the lime occasion the buildings of which they are the very substance and material. *English Agricultural Society's Journal.*

Calendar of Operations.

FEBRUARY.

SUSSEX FARM, *Feb.* 25.—The weather being fine our horse teams are engaged harrowing in Tares, and drilling Peas, 9 inches apart. If fine, we shall continue drilling Peas and Beans all the week; the Beans we drill 15 to 18 inches apart; our ox teams are engaged ploughing Turnip land for Barley, and preparing the land for the Potatoes, part of which we shall plant this week. We plant all early sorts in the field now, as they are not so liable to be diseased as the late sorts. We have a good stock in hand for seed, and they keep much better than they have done for two years past. Men are engaged threshing and cleaning Wheat, turning mixens, digging Hops, and draining, &c. *J. B.* [Can you give us a comparison of ox and horse labour as to expense?]

Notices to Correspondents.

ACIDITY IN BEER: *Humulus* says, "'Prevention is better than cure!' Is not there a fault in the mashing? Except in very cold weather, the water should not remain on the malt, for the first mash, longer than half-an-hour; even at the end of that time, litmus paper will be turned pink by what runs off. In warm weather, 1½ lb. of Hops should be used to each imperial bushel of malt, exclusive of what are put into the barrel; 2 lbs. would not be too much in hot weather. Let air circulate freely in the cellar, except when the beer is working. Try this and speak again."

BONES, &c: *T Halford.* The way to reduce the time during which bones will act—that is, to increase their immediate efficiency—is to increase their solubility. You should either apply bone *dust*, first fermenting it in heaps soaked with liquid manure; or you should dissolve them in acid before application. The latter would be the best way in the case of one who has only a year's interest in the land. It ought to be applied at once to benefit this year's crop.—As regards your Clover plant, you may top-dress with manure, sow some perennial seeds, harrow in, and so procure a permanent sward; and as to manures, guano and superphosphate of lime for Turnips, guano and sulphate of ammonia for Barley and Wheat, at the rate of about 3 cwt. per acre, are most likely to answer.

DAIRY PRODUCE: *Dairy Maid.* One pound of butter is yielded by from 9 to 12 quarts of milk, according to the breed of the animal.

DISEASES IN PIGS: *Constant Reader.* Next week. Manningtree is in Essex.

EGYPTIAN WHEAT: *F G.* You had better apply to Mr. Wilkins; he may possibly have a little to spare.

HAND DIBBLE: *Minimus.* Dr. Newington's. See advertisement. About wire fences we cannot help you. Perhaps the advertisers on that subject would inform you.

HOSE PIPES: *M S.* Gutta percha is probably the best. Prices may be ascertained of the Gutta Percha Company, London.

HYBRID PHEASANTS: *A W* says: "I heard several gentlemen speak of some they saw upon the estate of Mr. Bate, of the Leasows, Penn, in Staffordshire. They were not named as beauties, for they were said to have pheasant's bodies and hen's tails, and were the progeny of a hen pheasant."

INDIAN CORN: *A Constant Reader* should procure Mr. Keen's tract, entitled "Facts for Farmers." He will find that the profitable cultivation of the plant is impossible in our climate.

ITALIAN RYE-GRASS: *Amateur.* We cannot say whether, if sown now, it would furnish anything like a swathe before the scythe by Midsummer; but it would, no doubt, be ready for soiling in autumn, and again before Turnip seed time next year. If you sow two bushels in the end of April or beginning of May among your Wheat, and hoe it in, you will have a good crop early in spring.

KOHL RABI: *W A C.* Sow in beds in early April; 2 lbs. of seed will furnish an acre of plants. You may transplant in rows 2 feet wide, at intervals of about 28 inches in the rows; the plants will be ready for transplanting in June. The land should be prepared as for Turnips.

LIME AND MANURE: *W W.* Do not put both on the same year. Try bones or superphosphate of lime, applied broadcast, in March. Feed sheep on it during summer, and apply lime in autumn. Turnips, chaff, and oilcake will make cheaper beef than chaff and oilcake alone. Galloways of 50 stones weight will eat 1 cwt. of Turnips, 5 lbs. of chaff, and 4 lbs. of oilcake a day; or probably 20 lbs. of chaff or 4 lbs. of oilcake a day. In both cases the oilcake will cost about 2*s.* 4*d.* a week. In the one there is a balance of, say 14 lbs. of hay against 1 cwt. of Turnips in the other. At 3*l.* and 10*s.* respectively per ton, the latter costs about 1*s.* more per week than the former. More straw is used as fodder in the former case.

LUCERNE: *E D.* In mid April sow in shallow drills, 18 inches apart, on a deeply tilled well manured loamy soil, about 10 lbs. of seed per acre. You had better not attempt to grow Barley too.

MADDER: *M.* Could any of our readers, acquainted with the cultivation of this plant, give us the details?

MALTING: *X Y Z.* What is the best book on this subject?

MOSSY PASTURE: *M A.* Slake lime with brine, and spread it over the field at the rate of 50 or 60 bushels per acre.

PARSNIPS: *A Sub.* Sow in shallow rows, 18 inches apart, on deeply tilled well manured clay loam soil, about 5 lbs. of seed per acre. They should be sown *now*—they ought to have been sown before this. Carrots may be sown similarly in all respects in the first week of April. Mangold Wurzel should be sown in April just as Turnips are, only the seed should be dibbled in about 18 inches apart.

PIGS: *A Constant Reader.* The late Mr. Youatt published a work on the subject; and there is a shilling volume by Richardson—M'Glashan, Dublin.

SHOULDER LAMENESS: *B A Clericus.* Next week.

SMALL FARM: *New Forest.* It is necessary that we should know what are the most saleable articles in your neighbourhood. Have you a good market for dairy produce?

WHITE POPPY: *J Sylvester* asks for information on the culture of the White Poppy. Can any of our readers state their experience?

WORCESTER AGRICULTURAL SOCIETY: *Somerset* may see a sample of the guano made use of by Mr. Oldacre, at the Office of the Editor, 5, Upper Wellington-street, Covent-garden. If "Somerset" has not yet received a reply from Mr. Oldacre, "H. Webb" will direct his attention to the inquiry, and no doubt the information will be immediately furnished.

Markets.

COVENT GARDEN, MARCH 2.

Vegetables are plentiful, but many kinds of Fruit are scarce. Hothouse Grapes, with the exception of the Barbarossa, are over, and Pine-apples are anything but plentiful; as are also Pears and Apples. Walnuts, and Chestnuts are abundant, more especially the latter, and Oranges and Lemons are sufficient for the demand. Amongst Vegetables, Turnips and Carrots are good, and there is some fine Cornwall Broccoli in the market. Potatoes are unaltered since our last account; foreign ones fetch from 50*s.* to 80*s.* a ton. Lettuces and other salading are cheaper, and so are Mushrooms. French Beans, Asparagus, Seakale, and Rhubarb may be obtained at about last week's prices. Cut Flowers consist of Heaths, Pelargoniums, Bignonia venusta, Primulas, Camellias, Cinerarias, Christmas Roses, Azaleas, Lilacs, Lily of the Valley, Epacrises, Acacias, and Roses.

FRUITS.

Pine-apples, per lb., 6s to 9s	Almonds, per peck, 6s
Grapes, Portugal, p. lb., 9d to 1s	— sweet, per lb., 2s to 3s
Pears, per doz., 6s to 10s	Walnuts, p. 100, 1s 6d to 2s
Apples, kitchen, p. bsh., 4s to 6s	— p. bush., 16s to 24s
Lemons, per doz., 1s to 2s	Nuts, Bar., p. bush., 20s to 22s
— per 100, 6s to 12s	— Brazil, p. bsh., 12s to 16s
Oranges, per doz., 9d to 1s 6d	Kent Cobs, 65s to 75s p. 100 lbs
— per 100, 5s to 12s	

VEGETABLES.

French Beans, per 100, 3s to 5s	Carrots, per bun., 4d to 6d
Seakale, per punnet, 1s to 2s	Spinach p. sieve, 2s to 3s
Asparagus, p. bund., 1s 6d to 6s	Onions, p. bushel, 2s to 3s 6d
Rhubarb, p. bundle, 6d to 1s	— Spanish, p. doz., 1s 6d to 4s
Savoys, per doz., 6d to 9d	Shallots, per lb., 4d to 8d
Cauliflowers, p. doz., 1s to 4s	Garlic, per lb., 4d to 8d
Broccoli, p. doz. bundl., 8s to 12s	Lettuce, Cab., p. sc., 4d to 9d
Greens, per doz., 2s to 3s	Endive, per score, 1s 6d to 4s
Brussels Sprouts, p. hf. sieve, 1s 6d to 2s	Mushrooms, p. pot., 9d to 1s 3d
	Small Salads, per punnet, 2d to 3d
Sorrel, p. hf. sieve, 1s to 2s	Watercress, p. 12 bun., 6d to 9d
Potatoes, per ton, 60s to 120s	Fennel, per bunch, 2d to 3d
— per cwt., 3s to 7s	Savory, per bunch, 2d to 3d
— per bush., 2s 6d to 3s 6d	Thyme, per bunch, 2d to 3d
Turnips, p. doz. bun., 1s 6d to 2s 6d	Parsley, p. doz. bun., 2s to 3s
Red Beet, per doz., 9d to 1s	— Roots, p. bdle., 9d to 1s
Horse Radish, p. bdl., 1s to 4s	Marjoram, per bunch, 2d
Cucumbers, each, 3s to 5s	Mint, green, per bunch, 9d to 1s
Leeks, per bunch, 1d to 1½d	Corn Salad, p. hf. sieve, 9d to 1s
Celery, p. bundle, 8d to 1s 3d	

POTATOES.—SOUTHWARK, Feb. 25.

The Committee report that there have been many arrivals this week, both coastwise and Continental, and a large supply by rail, which, with mild weather, has tended to lower prices in nearly every description of Potato. The following are this day's quotations:—Yorkshire Regents, 80*s.* to 110*s.* per ton; Wisbeach do., 70*s.* to 90*s.*; Scotch do., 70*s.* to 80*s.*; Scotch cups, 65*s.* to 75*s.*; French whites, 70*s.* to 80*s.*; Belgian do., 70*s.* to 75*s.*; Rhenish, 65*s.* to 70*s.*

HOPS.—FRIDAY, March 1.

Messrs. PATTENDEN and SMITH report that the market continues about the same, but if there is any difference there is a better demand for speculation. We expect as the spring advances the demand will increase.

HAY.—Per Load of 36 Trusses.

SMITHFIELD, Feb. 28.

Prime Meadow Hay	66s	to 72s	Clover	60s	to 84s
Inferior ditto... ...	50	63	New Clover	—	—
Rowen	50	60	Straw	23	28

Inferior ditto ...	50	55	Inferior ditto... ...	55	63
New Hay	—	—	Straw	24	28
Old Clover	80	85			

SMITHFIELD, MONDAY, Feb. 25.

The supply of Beasts is very large, and the quality of it good. Trade is dull, and prices are lower; 3s. 8d. is an extreme quotation. Several remain unsold. The number of Sheep is rather larger than of late; the demand is limited, and prices remain about the same. Calves are plentiful. Trade is slow at Friday's rates. From Holland and Germany we have 388 Beasts, 90 Sheep, and 53 Calves; from Spain, 42 Beasts; from France, 9 Beasts and 210 Sheep: from Scotland, 400 Beasts; from Norfolk and Suffolk, 2600; and 300 from the midland counties.

Per st. of 8 lbs.—	s	d	s	d
Best Scots, Herefords, &c.	3	6 to 3	8	
Best Short-horns	3	4 — 3	6	
2d quality Beasts	2	8 — 3	0	
Best Downs and Half-breds	4	4 — 4	6	
Ditto Shorn				

Per st. of 8 lbs.—	s	d	s	d
Best Long-wools	3	10 to 4	0	
Ditto Shorn				
Ewes & 2d quality	3	0 — 3	6	
Ditto Shorn				
Lambs				
Calves	3	0 — 4	0	
Pigs	3	0 — 4	0	

Beasts, 3922; Sheep and Lambs, 19,440; Calves, 108; Pigs, 185.

FRIDAY, March 1.

The supply of Beasts is not large; however, it exceeds the demand. The amount of business done is very small, at about Monday's quotations. Trade is exceedingly dull for Sheep; prices are fully 2d. per 8 lbs. lower. We have several shorn, which are readily sold at fair rates, owing to the present favourable weather. The supply of Calves is large; there is a fair demand for them, at advanced rates. From Holland and Germany there are 66 Beasts, 100 Sheep, and 113 Calves; from Spain, 29 Beasts; from France, 120 Sheep; from Scotland, 100 Beasts; and 119 Milch Cows from the home counties.

Best Scots, Herefords, &c.	3	6 to 3	8	
Best Short-horns	3	4 — 3	6	
2d quality Beasts	2	4 — 3	0	
Best Downs and Half-breds	4	2 — 4	4	
Ditto Shorn				

Best Long-wools	3	8 to 3	10	
Ditto Shorn				
Ewes & 2d quality	2	10 — 3	4	
Ditto Shorn				
Lambs				
Calves	3	4 — 4	4	
Pigs	3	0 — 4	0	

Beasts, 794; Sheep and Lambs, 3470; Calves, 239; Pigs, 204.

MARK LANE.

MONDAY, FEB. 25.—The supply of Wheat from Kent by land carriage samples to this morning's market was good, but small from Essex; the latter sold freely at fully the terms of this day se'nnight. The demand for foreign Wheat was limited, but the prices are unaltered.—The value of Barley and Beans remains the same.—White Peas are 1s. per qr. cheaper. —The Oat trade is not worse, and sweet old foreign rather more inquired after.

Foreign		8362	—	—	762	2875	—

FRIDAY, March 1.—The arrivals of foreign grain during the week have been very trifling. To-day's market was but thinly attended, and in the few sales made of Wheat prices must be considered nominally the same as on Monday.—We observe no alteration in the value of Barley, Beans, Peas, or Oats, and but a limited business doing in either.—The Wheat trade during the week in the principal markets of the kingdom has been extremely languid, with rather a tendency in prices to decline. Spring Corn has also continued very dull. By the last accounts the frost seems to have returned in the Baltic, and there appears little probablity that the ports of Memel, Konigsberg, and Dantzic will open prior to the beginning of April; the supplies there found buyers as fast as they arrived, at fully former prices. In Stettin, Anclam, Stralsund, Greifswald, and Rostock, the supplies continue too small to admit of any decline in prices, and 62—63 lbs. Wheat cannot be bought below 35s. to 36s. per qr., f.o.b. Prices in the French markets are too high to admit of profitable exportation to this country. In Holland the markets are firm at former prices.

ARRIVALS THIS WEEK.

LIVERPOOL, TUESDAY, FEB. 26.—The supplies of grain and Flour during the past week are on a small scale, but our demand has been quite as limited, and no change of consequence has occurred in the price of any article. On Flour there was a marked decline of 6d. per barrel and 1s. per sack on the rates of this day se'nnight. Oats were ½d. to 1d. per bushel lower. Oatmeal declined 3d. per load, and Beans 6d. per qr. Indian Corn was also 6d. per qr. lower.

HARTLEY'S PATENT ROUGH PLATE GLASS FOR CONSERVATORIES, &c.

See Article in THE GARDENERS' CHRONICLE of Saturday, December 8, 1849.

"Continued experience leaves us no room to doubt that this is the best material yet produced, and that it will in time supersede glass of all other kinds for the greater part of Gardening purposes." . . . "As for the article substituted for Rough Plate . . . it is wholly unfit for any horticultural purpose." . . . "The best sample of it which we have yet seen was Manufactured by Messrs. HARTLEYS, AND SOLD BY MESSRS. JAMES PHILLIPS & CO., 116, BISHOPSGATE STREET."

CROWN, SHEET, AND ROUGH PLATE GLASS FOR HOTHOUSES, CONSERVATORIES, &c.

Of every manufacture FIT FOR USE, including the make of Messrs. CHANCE, HARTLEY, SWINBURNE, and others.

100 and 200 feet cases of large Sheet Glass, from 2½d. per foot. Small ditto, 10s. 6d. per 100 feet, packed in boxes ready for immediate delivery. Curators of Botanical Societies, Florists, Railway Agents, and others requiring large quantities, will, on sending dimensions, receive estimates at the lowest prices.

GLASS MILK PANS, CREAM POTS, Lactometers, Bee Glasses, Fish Globes, and all kinds of Dairy Glass, Propagating Glasses, Hyacinth Dishes, Cucumber Tubes, and every other description of Garden Glasses.

PATENT GLASS PENS, self supplying, never blot, never soil the ruler, and will write continuously for 12 hours.

Also, Glass Rulers, Glass Inks for office-stands, desks, &c. Stationers and Schools supplied. Wholesale Warehouse for Ornamental Shades, Lamp Shades, Gas Glasses, Genuine White Lead, Paints, Colours, and Pumps for Farm purposes.

Our Catalogue of 18 folios is the most complete ever published. No Gardener or Farm Bailiff should be without one. May be had Gratis on sending two postage stamps to Messrs. COGAN and Co., 48, Leicester-square, London.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, &c.

HETLEY AND CO. are supplying 16-oz. Sheet Glass, of British Manufacture, packed in boxes containing 100 square feet each, at the following REDUCED PRICES for cash, A reduction made on 1000 feet.

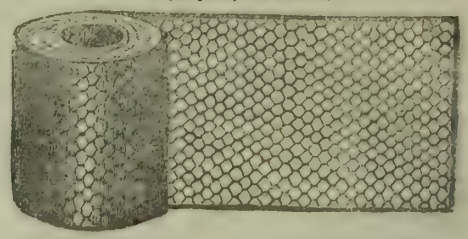
Wasp Traps.—Lists may be had, on application at the Warehouse, 87, Bishopsgate-street Without, same side as the Eastern Counties Railway.

FLEXIBLE INDIA-RUBBER HOSE PIPES.

JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING. These Pipes are well adapted for watering Gardens, conveying Liquid Manure, for Breweries, Gas Fittings, Chemical and all purposes where a perfectly sound WATERPROOF and FLEXIBLE PIPE is required. Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently flexible in all temperatures, and are therefore particularly suitable for Fire-Engines; and from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes. Being extremely portable, stowing closely without danger of injury, resisting the influence of climate, insects, and vermin, frequently so injurious to such articles on board ship, and retaining their virtues though long out of use, render them particularly adapted for exportation.



N.B.—VULCANISED INDIA-RUBBER GARDEN HOSE, fitted with Roses, Jets, and Branches, complete, with Union Joints, ready to attach to Water Cisterns.

All letters or Orders addressed to J. L. H. at the Manufactory and Warehouse, Goswell-mews, Goswell-road, London, will meet with immediate attention.

EMIGRATION to the AUSTRALIAN COLONIES. —For ADELAIDE, PORT PHILLIP, and SYDNEY, the fine, 1st-class, teak-built ship ORIENTAL, Capt. J. P. TAYLOR, 1000 tons, coppered and copper-fastened; will sail from the St. Katharine's Docks about the 5th March, calling at Plymouth. This very superior ship is fitted up expressly for the comfort and accommodation of passengers, with separate enclosed cabins of an extra size for families and married couples. She has upwards of 8 feet height in the 'tween decks, which are thoroughly lighted and ventilated. The passage money 20 guineas each adult, including bedding and mess utensils. There will be a library on board. She has a most magnificent poop and saloon, with elegant accommodation for cabin passengers. A skilful surgeon will proceed in the ship. For freight or passage apply to JOHN WHITTAKER, 78, Mark-lane; or to W. R. BRUFTON & Co., Great Tower-street, London.

GALVANISED WIRE GAME NETTING.—

7d. per yard, 2 feet wide.

		Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide	...	7d. per yd.	5d. per yd.
2-inch ,, strong ,,	...	9 ,,	6½ ,,
2-inch ,, extra strong ,,	...	12 ,,	9 ,,
1½-inch ,, light ,,	...	8 ,,	6 ,,
1½-inch ,, strong ,,	...	10 ,,	8 ,,
1½-inch ,, extra strong ,,	...	14 ,,	11 ,,

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3d. per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING

Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

STALLIONS FOR SALE.—Two five-year-old Suffolk Stallions, the property of T. BEALE BROWNE, Esq., Hampen, Andoversford, Gloucestershire. One is 17 hands high, the other over 16. They are sure foal getters, and were much admired and highly commended by the Judges at the Royal Agricultural Society's Show at York.

Also two very fine five-year-old Suffolk Geldings.

TO THE LOVERS OF FLOWERS.

COLES'S SOLUBLE COMPOUND ALKALINE POWDER.—Confidently offered as a most efficacious application for promoting the healthy growth and beauty of all kinds of HARDY OR TENDER PLANTS AND FLOWERS, requiring merely A SMALL TEASPOONFUL of it to be dissolved in every ENGLISH PINT OF WATER USED, and the solution to be applied occasionally, by means of a common rose watering-pan.

Sold, in GLASS BOTTLES of 1s. 6d., 2s., 2s. 6d., 3s. 6d., and 5s. each, by HENRY COLES, Seedsman, &c., 32, Cranbourn-street, Leicester-square, bearing his seal, signature, and address upon the corks and labels (without which none is genuine), of whom also may be had the celebrated

CARBONIZED ANIMAL MANURE,

prepared, in like manner, specially for FLOWERS, perfectly free from smell, to be used in a DRY STATE, and sold in TIN CANISTERS of 1s., 1s. 9d., and 2s. 6d. each, or COMPACT WOODEN BOXES of 5s., by taking which, a considerable saving in price is obtained.

Wholesale Orders for the above, and the same prepared in a LESS REFINED STATE for AGRICULTURAL PURPOSES, FRUITS, AND VEGETABLES, also punctually executed, to any extent, upon application to the MANAGER at the MANUFACTORY, Middle Yard, Great Queen Street, Lincoln's Inn Fields, where may be seen analyses of the various sorts, made by Professor WAY (analytical chemist to the Royal Agricultural Society of England), and other eminent authorities.

AUSTRALIA, NEW ZEALAND, CAPE OF GOOD HOPE, NATAL, &c.

PASSENGERS to the COLONIES generally may obtain their OUTFITS from S. W. SILVER and CO., CLOTHIERS, &c., 66 and 67, CORNHILL, at wholesale prices. SILVER and CO. make nearly the whole of the articles comprised in an outfit, to secure durability, so that the Cabin Folding Furniture may become permanent Household Furniture on arrival in the colony.

They also engage PASSAGES, and give ship sailing INFORMATION, but they neither receive nor pay a commission—their object being to give PASSENGERS who place themselves in their hands every benefit; and they forward small packages for their customers (gratis) through their AGENTS in the COLONIES.

SILVER and CO. give DRAFTS on AUSTRALIA at sixty days' sight of 100l. for every 100l. paid here.

The EMIGRANT Fitting-out Branch is at No. 4, Bishopsgate-street, opposite the London Tavern, where a comfortable fit-out for male or female, including bedding, may be obtained for FOUR POUNDS.

A Branch of each at ST. GEORGE'S-CRESCENT, LIVERPOOL.

MESSRS. LODDIGES' CELEBRATED ARBORETUM FOR SALE BY AUCTION.

TO NOBLEMEN, GENTLEMEN, AND NURSERYMEN.

MR. J. C. STEVENS is favoured with instructions from Messrs. LODDIGES, of Hackney, to submit for unreserved competition, on the premises, on MONDAY, 4th March, and five following days, at 11 for 12 precisely, in consequence of the decease of the Senior Partner, the FIRST PORTION OF THEIR UNRIVALLED ARBORETUM, comprising many thousand well-grown specimens of the rarest and most beautiful Trees and Shrubs, affording to noblemen and gentlemen engaged in Ornamental Planting an opportunity which has never before occurred. — Catalogues are preparing, and will be ready for delivery 10 days prior to the sale, on the premises, and of Mr. J. C. STEVENS, 38, King-st., Covent-garden, London.

AMERICAN PLANTS.

MR. J. C. STEVENS begs to notify that two days of the Sale at Messrs. LODDIGES will be devoted entirely to the American Plants, which comprise Azaleas full of flower-buds and well adapted for forcing, Kalmias, Andromedas, Ledums, &c.

CHOICE CAMELLIAS.

FOR SALE BY AUCTION, AT MESSRS. LODDIGES NURSERY, HACKNEY.

MR. J. C. STEVENS is directed by Messrs. Loddiges to sell by Auction, on their Premises at Hackney, on TUESDAY, the 19th, and WEDNESDAY, the 20th of March, at 12 for 1 o'clock, a selection of about 1000 CAMELLIAS, from 3 to 12 feet high, beautifully formed plants, well furnished with bloom-buds, and comprising many Double White, Candidissima, Donckelarii, Aulica, and other choice sorts; also a few fine specimens of Araucaria excelsa, 4 to 5 feet, Rhododendrons robustum and campanulatum, 3 to 5 feet. Handsome Plants of Andromeda floribunda in flower, and some Limes in fruit.—May be viewed the day before the Sale, and Catalogues had on the Premises, and of Mr. J. C. STEVENS, 38, King-street, Covent-garden.

AMERICAN PLANTS, STANDARD ROSES, ORNAMENTAL TREES, EVERGREENS, &c.

MR. D. A. RAMSAY has been favoured with instructions, from an eminent Firm, to sell by Auction, on the premises, Brompton Nursery, Fulham-road, Brompton, on MONDAY, March 11th, and following day, at 12 o'clock each day, without reserve, a further consignment of choice AMERICAN PLANTS, comprising 700 Rhododendrons, 2 to 4 feet, 200 Scarlet Rhododendrons, a quantity of Azaleas, Andromedas, Hardy Heaths, Sedum, &c.; a quantity of strong Grape Vines, Figs, Standard and Dwarf-trained Fruit Trees, a choice assortment of Clematis, Jasmine, and other Creepers, 500 Standard, Dwarf, and Climbing Roses, 5000 large Evergreens in variety, 3000 Limes, Acacia, Willow, Poplar, and other ornamental Trees, with a quantity of Deciduous Shrubs, and other Nursery Stock.—May be viewed three days prior to the Sale, and Catalogues had, 6*d.* each, returnable to purchasers, at the usual Seed Shops, and of the Auctioneer, Brompton Nursery, Fulham-road, Brompton.

FOR PUBLIC SALE, on MONDAY, March 4, at the New Corn Exchange Tavern, Mark Lane, at 2 o'clock precisely, by Order of Messrs. ANTONY GIBBS and SONS, the Importers, about 250 Tons of damaged PERUVIAN GUANO, in warehouses, ex sundry ships.—Catalogues, and further particulars in due time, from L. A. RUCKER and BENCRAFT, Brokers, 26, Commercial Sale Rooms, Mincing-lane, London.

TURNIP AND BARLEY FARM.

TO BE LET, and entered on at Lady day next, a desirable BARLEY and TURNIP FARM, in Gloucestershire, of about 160 acres, with a comfortable House for a small family, 30*s.* per acre and tithe free. About 50 acres more may be had. The South Wales Railway will pass through the Parish.—Apply by letter to Mr. WM. MIDDLETON, Post-office, Stamford, Lincolnshire.

TO BE LET, for a term of years, on a CORN RENT, a FARM, in one of the Midland Counties, within two miles of a Market Town and Railway Station. It consists of about 200 acres, 18 of which are in Water Meadow, 28 in Pasture, and the remainder are excellent Turnip and Barley soil. The whole is of a first-rate quality. The Farm Buildings have been lately erected, are on a most complete and comprehensive plan, and are in excellent repair; and the Farm-house possesses every convenience and accommodation required by a respectable family. This Farm is in an excellent state of cultivation. All the interior hedge-rows and timber have been grubbed up; and the arable land is formed into four fields, divided by excellent roads. The Farm is, and has been for some time, under the 4-field system of cultivation. To a gentlemen possessing the requisite capital and ability, who can carry out a good system of agriculture, this Farm is well adapted. Entry at Lady-day. Apply to Mr. JOHN MORTON, Whitfield, Berkeley, Gloucestershire.

TO AGRICULTURAL MACHINE AND IMPLEMENT MAKERS, MILLWRIGHTS, AND OTHERS.

TO BE LET, by Private Contract, with possession at Lady-day next, an old established and well-connected BUSINESS of the above description, with an excellent Residence and extensive ranges of Shopping, a Seven-horse power Steam Engine, large Yard, and every convenience for carrying on an extensive trade. The situation of the property is in the midst of an agricultural district in South Staffordshire. The business has been carried on very successfully for the last 35 years; and the Proprietor, who is retiring, has very extensive connections in most of the surrounding counties. The stock of Timber, Tools, and Machinery may or may not be taken, at the option of the purchaser.—For further particulars, and to treat, application is requested to be made to Mr. THOMAS PAGE, House and Estate Agent, Darlington-street, Wolverhampton, Staffordshire.

HAMPSHIRE.

TO BE LET, by tender, a good ARABLE FARM, of 680 acres, with immediate possession. It is within three miles of a railway station, and at an easy distance from Basingstoke, Andover, and Newbury Markets. Tenders, stating the amount of rent offered, and containing references as to the experience and capital of the applicants, must be sent in previously to the 20th of March next.—For particulars, and to view, apply to Mr. H. RAYNBIRD, Laverstoke, Andover-road.

TO BE LET, in the County of Surrey, a NURSERY, nine miles from town, containing nearly seven acres of land, well stocked with Shrubs, &c., a good Dwelling-house, five Greenhouses and three ranges of Pits, all in excellent repair.—Direct to R. C., at Messrs. Noble, Cooper, and Bolton, Seed-merchants, 152, Fleet-street, London.

THE BIRMINGHAM CATTLE SHOW, 1850.—The Prize Lists for Cattle, Sheep, Pigs, and Poultry are now ready, and may be had on application to the Honorary Secretary.
T. B. WRIGHT, Hon. Sec.
Union-street, Birmingham, March 2.

CORN MANURE.

BLASHFIELD'S PATENT COPROS.—A new Manure for Corn and other Crops, prepared from the nitrogenous matter deposited on the banks of the Thames, in combination with other substances essential for the growth of corn, &c., price 8*l.* per ton. Sold, in a finely ground state, at No. 3, New London-street, Mark-lane; also, at the Works, Mill-wall, Poplar; Waterloo Dock, Lambeth; and No. 1, Praed-street, Paddington Basin.

PATENT COPROS, for Corn crops, also for Turnips, &c.; Superphosphate of Lime, Gypsum, calcined and saturated with liquid manure. CEMENT for Liquid Manure Tanks, Malt House Floors, and Barn-floors, manufactured by J. M. BLASHFIELD, successor to Wyatt Parker and Co., Original Patentees —Parker's Cement. Established 1796. Drain Pipes, Tiles, &c.

MANURE IS MONEY.—MOST IMPORTANT TO LAND PROPRIETORS, FARMERS, GRAZIERS, GARDENERS, AND OTHERS. A new and excellent Treatise.

THE FARMER'S FRIEND AND COMPANION; showing how to farm to meet the times, and save money, by introducing, for the benefit of the agriculturists, a new and most valuable receipt for the manufacturing of the New Patent Manure, which will be sent gratis, and can be manufactured without a license by every farmer, as the preparation is most simple and cheap, and suitable for all seasons, soils, and crops, at the trifling expense of 1*l.* per acre, warranted equal to 12 loads of farm-yard manure, and a perfect substitute for all foreign manures. Also showing how to fatten every description of Stock and Poultry, at one-third the cost now adopted, the best and cheapest method of draining, &c. This valuable Treatise on Farming and Grazing, registered and entered at Stationers' Hall, contains also a collection of 150 of the most valuable receipts ever discovered in agriculture for profit, &c., with full directions for use, by the late celebrated agriculturist, Mr. Ellman, and others, and patronised and highly recommended by H. R. H. Prince Albert, at Windsor Farm, the Royal Agricultural Society of England, their Graces the Dukes of Richmond, Portland, and Bedford, &c., and will be forwarded, without fail, by return of post, free, to any part of the country, by enclosing 12 postage stamps, addressed, pre-paid, to Messrs. MORGAN and Co., Post-office, Lisson-grove, Marylebone, London. Mind the address.

N.B. The receipt for manufacturing the Patent Manure can be had alone, by forwarding six postage stamps.

SUPERIOR BOLIVIAN GUANO.—This Guano is of a very superior quality, of a pale straw colour, and in the highest state of preservation. For the last five years the Worcestershire Agricultural Society has awarded the prize for the best 2 acres of Swedes grown with Guano only, to parties who have made use of this description of Guano. It has been analysed by Dr. ANDREW URE, London; and WM. HERAPATH, Esq., Bristol.

Dr. ANDREW URE remarks: "The best Peruvian Guano is inferior in power and value to this Guano as 17 is to 24. It is the pure excrement of the birds."

W. HERAPATH, Esq., states: "One pound of this Guano is equal in fertilising power to nearly 40 lbs. of Farm-yard Dung. Judging from its nitrogen alone, it is a very rich Guano."

Apply to H. and G. WEBB, Merchants, Worcester, who also hold a cargo of the same kind of Guano in Liverpool and in Glasgow.

MR. EDWARD RYDE, LAND SURVEYOR, DRAINAGE and AGRICULTURAL ENGINEER, LAND AGENT, &c. will send free, on receipt of 14 postage stamps, "A READY RECKONER, with plain instructions for Measuring and Valuing Hay-ricks." Surveys, Maps, Sections, Specifications, and Estimates for Land Improvements. Agencies conducted by yearly contract. Estates sold or let.—Address, 14, Upper Belgrave-place, Eaton-square, London.

JAMES PHILLIPS AND Co., 116, BISHOPSGATE-STREET WITHOUT, LONDON.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

BOILERS OF ALL SIZES TO BE SEEN IN OPERATION, WARRANTED THE BEST.

J. WEEKS AND Co., King's-road, Chelsea, HORTICULTURAL ARCHITECTS, HOTHOUSE BUILDERS, and HOT-WATER APPARATUS MANUFACTURERS, solicit an inspection of their various Works completed and in progress. Horticultural Buildings of every variety. BOILERS of all sizes to be seen in operation, and which they warrant to be the most effective and economical of any in use. The largest size Boiler is now effectually heating three extensive ranges of Forcing-houses, 230 feet by 22 feet, all Span Roofs and lofty, containing upwards of 50,000 cubical feet of air. Also various small and intermediate size Boilers, some of all sizes in operation. The consumption of fuel is very moderate, and the fires will continue from 10 to 15 hours without attendance. The extensive arrangements now in full operation on their premises, enables them to build to any extent, and at very moderate prices. Hothouses, Greenhouses, Conservatories, Forcing-pits, Frames, Glass Lights, &c. A very extensive collection of Stove and Greenhouse Plants, which are sold at very low prices. Plans, Estimates, and Catalogues forwarded on application.
J. WEEKS and Co., King's-road, Chelsea.

MANGOLD SEED. — About 100 stones of the Yellow Globe MANGOLD WURZEL SEED for Sale, of last year's growth, carefully selected, and all transplanted.—Apply to Mr. GEO. JOHNSON, Morton, near Retford, Nottinghamshire.—March 2.

POULTRY.—For Sale, two pairs of pure American WILD TURKEYS, four GAME COCKS, bred in 1849 from a Japanese Jungle Cock and English Game Pullets; five BLACK SWANS.—Apply to the Superintendent at the Gardens of the Zoological Society, Regent's Park, London.

SILVER SAND, PEAT, &c.—REMOVAL.

EDWARD KEMP begs to thank his numerous friends for their kind support during the last seven years, and informs them that he has removed to No. 16, Ann's-place, East-street, Old Kent-road, where he respectfully solicits a continuance of their favours.

BRITISH SILK CULTIVATION.

WHITE MULBERRY TREES, & SILK-WORMS' EGGS.—The Advertiser begs to announce to the Public that he has on hand a most healthy Stock of White Mulberry Trees, the only proper food for the rearing of Silk Worms, at the following low prices:—1 year's growth, 10*s.*; 2 years', 15*s.*; 3 years', 25*s.*; 4 years', 30*s.*; and 5 years', 35*s.*, per 100. Silk-Worms' Eggs, best quality, 1*s.* 6*d.* per 1000. Orders, inclosing Post-office order, punctually executed.—Address JOHN RICHARD EVANS, 8, Cork-street, Bond-street, London; or GEORGE BALCHIN, Spring-place, Godalming, Surrey.

WIRE STRAND FENCING, as fixed by R. S. NEWALL and Co., is cheaper, stronger, more durable and elegant than any other Fence hitherto introduced.
COPPER WIRE HOTHOUSE SASH LINE.
LIGHTNING CONDUCTORS.
Office, 130, Strand, London; Warehouse, Brunswick-street, Blackwall; Manufactory, Gateshead, on Tyne.

IRON AND WIRE FENCING, AND METALLIC BEDSTEADS.

THOMAS PERRY AND SONS, 252, OXFORD-STREET (NEAR HYDE PARK), And Highfields Foundry and Wrought-iron Works, Bilston, Staffordshire, Manufacturers of all descriptions of PLAIN AND ORNAMENTAL IRON AND WIRE FENCING, Park Entrance, Carriage and Field Gates, Wickets, &c.; Deer, Sheep, and other Hurdles; Hare and Rabbit-proof Wire Fencing; Iron Bedstead Makers to the Board of Ordnance; And Government Contractors.

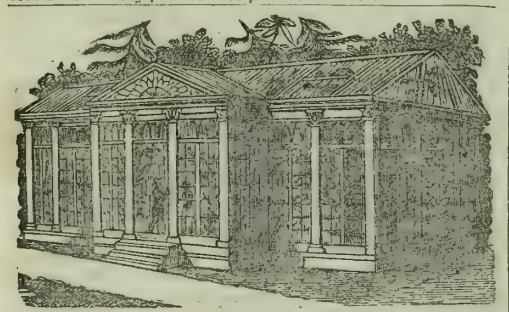
The works of Messrs. PERRY being situated in the heart of the best iron district, they are enabled to execute all orders with the greatest facility, and on the most moderate terms. Drawings made and estimates prepared, if required. The show rooms contain an immense variety of every description of Iron and Wire-work, and are the largest in London. An Illustrated Catalogue of Bedsteads, with dimensions and prices, sent on application, post-free.

LOANS TO FARMERS AND OTHERS.

MONEY TO BE ADVANCED, to any amount, in large or small sums, not less than 150*l.*, at interest varying from 4 to 5 per cent., and for long and short periods, to be secured upon FARMING STOCK personal securities &c., or upon Freehold, Copyhold, or long Leasehold property, to the extent of 30,000*l.*, upon Reversions to money in the Funds, Life Interests &c. Applications to be addressed, prepaid, in the first instance, to the care of Mr. Charles, 9, Great College-street, Westminster, London. All communications held strictly confidential, and to prevent unnecessary trouble it is requested that applicants send full particulars.

MARQUEES, SUN BLINDS, RICK CLOTHS, &c.—Manufactory, Old Kent-road (facing the Bricklayers' Arms Railway Terminus), and 17, Smithfield Bars, London.

The guests are arriving; my villa has got
Quite a park-like appearance—a beautiful spot;
The band on the lawn, in the spacious marquee;
This tent for our dinner, and that for our tea.



Marquees and temporary rooms superbly fitted up for Fêtes, &c., on most moderate terms, by THOS. EDGINGTON and Co. Tents of every description, Rick Cloths with Poles, &c. Tanned Netting for the protection of fruit trees from frost, blight, and birds, and for the security of fresh sown seed, either in gardens or fields, at unprecedented low prices, viz., 1*d.* per square yard, or 200 yards for 14*s.*, or 500 yards for 30*s.*, or 1000 yards for 58*s.* New Archangel Mats and Scrim Canvas for wall fruit. Tarpaulings for houses under repair on hire. Orders and inquiries per post immediately attended to.

CROSSKILL'S PRIZE AGRICULTURAL IMPLEMENTS, kept in stock for delivery from Hull to London, Southampton, Bristol, Liverpool, Leith, and all parts of the Kingdom. On receipt of six penny stamps, to cover postage, a *new* Illustrated Catalogue of CROSSKILL'S Field, Road, and Barn Implements of the newest and best construction, will be sent *gratis per post*. The new prize portable Farm Railway is expressly and admirably adapted for agricultural purposes, and will pay its cost the first year.

Address—Mr. CROSSKILL, Iron Works, Beverley.

PATENT SPADES, DAISY RAKES, SCYTHES, Draining, and other Garden Tools. Mole Traps, 6*s.* per dozen; Carpenter's and Smith's Tools, &c. Ladies' Garden Tools, 7*s.* 9*d.* a set. Sword-scrapers for gardens, 1*s.* 2*d.* each. Dr. Arnott's Ventilating Chimney-valves, plain, 5*s.*; Ornamental ditto for Drawing-rooms, at J. H. BOOBBYER and Co.'s (late STUNCH and BOOBBYER), Ironmongery, Brass-foundry, Nail and Tool Warehouse, 14, Stanhope-street, Clare-market, London. Established nearly 200 years for the sale of goods from the best Manufactories at the lowest prices. Goods forwarded to any part on receipt of remittance.

GRAY, ORMSON, AND BROWN, Danvers-street, Chelsea, solicit the attention of the Nobility, Gentry, and Gardeners, to their superior manner of Erecting and Heating every description of Building connected with Horticulture. The work done by them at the Right Hon. the Earl of Kilmorey's, to which they have had the honour of referring so long, still continues to give perfect satisfaction. Mr. Kinghorn will be happy to show the work and give any information.

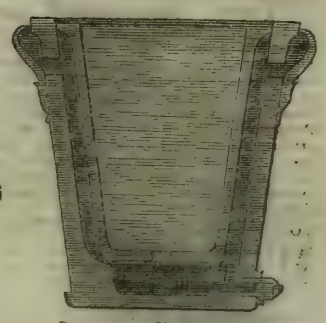
They also beg to refer to the houses built by them during the past season, for the Worshipful Apothecaries' Company of London, in their Botanic Garden at Chelsea. Mr. Moore, the Curator, will kindly show the work, and answer any enquiries. They beg also to say the Building only is referred to, as the Heating Apparatus was not erected by them.

GRAY, ORMSON, and BROWN have also the honour of referring to many of the nobility and gentry in the country, and to several of the London Nurseries.

N.B. Plans and Estimates furnished free.

FLOOR CLOTHS.—
Best quality, warranted..... 2*s.* 6*d.* per sq yd.
Persian and Turkey pattern..... 2*s.* 9*d.* ditto.
Common Floor Cloth..... 2*s.* 0*d.* ditto.

COCOA-FIBRE Mats and Matting.—JAPANNED-FOLDING Screens from 32*s.*



JOWETT Manufacturer, 532, New Oxford-street, London.

METCALFE'S ALKALINE TOOTH-POWDER will be found to be the best that has yet been produced; it contains no acids, nor anything that can injure the finest enamel; it thoroughly removes the tartar and all impurities, produces that beautiful white appearance so much to be desired, and its fragrant perfume tends to sweeten and purify the breath. M. and Co., from the many years they have been celebrated as Tooth-Brush Makers, have had opportunities (that occur to few) of testing the relative merits of those powders that have been brought before the public. They have now succeeded in procuring the receipt from which the above Powder is prepared, and confidently recommend its universal adoption. Wholesale and retail at METCALFE, BINGLEY, and Co.'s, Brush-Makers to H.R.H. Prince Albert, 2*s.* per box. Caution.—The genuine Powder will have the Royal Arms, combined with those of H.R.H. Prince Albert, on the lid of the box, and the signature and address of the firm, thus: "METCALFE, BINGLEY, and Co., 130 B, Oxford-street, London."

REGISTERED.

THE GRADUATED PLUG
FLOWER POT.

SECTION OF FLOWER POT.

MANUFACTURERS,

OLIVER and Co., 210, Regent Street,
LONDON.

IT has been a source of great regret among Horticulturists that the most eminent manufacturers of Porcelain have failed to produce Flower Pots, in which the useful has been successfully blended with the ornamental, or in which perfect drainage and constant moisture are combined.

THE GRADUATED PLUG FLOWER POT will effect these desiderata. It is formed of two pots, joined at the bottom, and made perfectly water-tight. The inner one is of highly-porous clay. A hollow double plug or tap fixed on the outer side graduates the supply of water. A second plug forming part of the first, by being withdrawn, ensures the most perfect drainage when required.

NEW WORK ON GARDENING AND BOTANY.

Just published, price 2*s.* 6*d.*, No. 1. of

PAXTON'S FLOWER GARDEN.

EDITED BY DR. LINDLEY AND JOSEPH PAXTON.

AND LLUSTRATED BY HIGHLY FINISHED PLATES AND WOODCUTS.

This Work, for which Monsieur CONSTANS, a French Botanical Draughtsman of great taste and skill, and a pupil of Mons. Decaisne, has been expressly engaged, will be confined to the proper business of an illustrated book, namely the representation and description of all new plants which may appear in gardens. The species which are of most importance will be illustrated by coloured plates, one species or genus only to a plate, with a leaf or more of letter-press, explaining the principal scientific and horticultural facts which belong to each plant. The species of less importance will be treated of more briefly, and will be illustrated when necessary by copious woodcuts and vignettes. The object, in short, will be to combine Scientific Botany with Gardening, and exact delineations of plants with pictorial effect. It is believed that by such means this periodical will not only be indispensable to the BOTANIST and GARDENER, but be also a mine of invaluable hints by which the ARTIST and MANUFACTURER will be able to profit.

It is not intended to admit any other kind of matter than such as is now described. All special treatises on cultivation, and all disquisitions respecting subjects incidental to gardening, will be transferred to the *Gardeners' Chronicle* and similar periodicals, in which there is ample space for such discussions, and to which they have now become better adapted than to a pictorial work.

London: BRADBURY AND EVANS, 11, Bouverie-street.

NEW FLORICULTURAL PERIODICAL.

Now ready, PART II., price Half-a-Crown, of

THE MAGAZINE OF BOTANY,

HORTICULTURE, FLORICULTURE, AND NATURAL SCIENCE.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

KANE'S ELEMENTS OF CHEMISTRY IMPROVED.
Second Edition, in 1 large vol. 8vo, with 230 Woodcuts of the most approved Chemical Apparatus and Machines, 28*s.* cloth.

ELEMENTS of CHEMISTRY, Theoretical and Practical; including the most recent Discoveries and Applications of the Science of Medicine and Pharmacy to Agriculture, and to Manufactures. By Sir ROBERT KANE, M.D., M.R.I.A., President of the Queen's College, Cork; Director of the Museum of Irish Industry, &c.

"We have taken some trouble in order to ascertain what work could be recommended as the most suitable text-book of chemistry for the use of such parties as wish to make themselves acquainted with the science, mainly for the sake of understanding its practical applications to agriculture. The result of our inquiries is, that we feel inclined to recommend this work by Sir Robert Kane as, on the whole, the most full and complete, and what, for our purpose, is an essential requisite, the most practical in its bearing of any elementary treatise on chemistry that we at present possess."—*Scottish Farmer*, Jan. 4, 1850.

London: LONGMAN, BROWN, GREEN, and LONGMANS.
Dublin: HODGES and SMITH.

NEW JUVENILE WORK BY MRS. DAVID OSBORNE.

PRIMULA ALTAICA,
Figured in the August No. of "Paxton's Magazine of Botany."
C. TURNER has a few strong plants left of the above Hardy Winter Flowering Plant (which is now in bloom), at 3*s.* 6*d.* each.—Royal Nursery, Slough.

SELECT CULINARY SEEDS.

J. WEEKS AND CO., King's-road Nursery, Chelsea, begs to offer to the Public this condensed selection of really distinct good varieties of CULINARY SEEDS, in one collection, for 18*s.*, sufficient for a moderate-sized garden.
PEAS.—Prince Albert, British Queen, Champion of England, Knight's New Early Improved, fine flavour; Bishop's Long-podded, very dwarf; Improved Marrow.
BEANS.—Prolific French Dwarf Kidney, Scarlet Runners, Johnson's Wonderful Windsor, Green Windsor, New Royal Dwarf Cluster, Long-pod.
BEET.—Weeks's superb Blood-red, dwarf.
CAULIFLOWER.—Cyprian, late; London, early.
KAIL.—Dwarf green curled.
PRUSSELS SPROUTS, Imported.
BROCCOLI.—Walcheren, Early purple Sprouting, Willcove, Mammoth.
CABBAGE.—British Queen, Spotsboro' Improved, Early Cornish, Dutch Red for pickling.
SAVOY.—Green Curled, Large Drumhead, Yellow.
CARROT.—Dutch Horn, earliest; Long Surrey, Altringham.
CELERY.—Myatt's Superb Solid, Coles' Superb Solid.
CRESS.—Curled. MUSTARD.—White.
CHILI.—True, for vinegar. [open ground.
CUCUMBER.—Great Britain, Syon House, Long Prickly for
KOHL RABI.—Hardy Green. LEEK.—London Flag.
LETTUCE.—Brown Cos, black seeded; White Cos, Drumhead Cabbage.
MELON.—Fleming's Hybrid, Windsor Prize Green. [pickling.
ONION.—White Spanish, James's Keeping, Silver-skinned for
PARSLEY.—Weeks's Triple Curled, for garnishing.
PARSNIP.—Improved Hollow-crowned.
RADISH.—Red and White Turnip, New Olive long. [Zealand.
SPINACH.—Round, for summer; Prickly, for winter, New
TOMATOES AND NASTURTIUMS, for pickling.
TURNIPS.—Red Stone, American; Snowball.
VEGETABLE MARROW.—White, Green.
SQUASH, used in preference to Vegetable Marrow.
SALSAFY, for soups and stews.
HERBS.—Thyme, Sweet Basil, Savory, Knotted Marjoram, Hyssop, and Dill.
Various Catalogues of Stove, Greenhouse, and other Plants; also Kitchen Garden and Flower Seeds, can be had on application.—March 9.

BEAUTIFUL FLOWERS.—100 packets for 6*s.* 6*d.*; 70 for 5*s.*; 60 for 4*s.* 6*d.*; 30 for 2*s.* 6*d.*; 12 for 14 penny stamps (all post free), warranted new and genuine; also packets of Garden Seeds, free to any part of England, at 5*s.*, 10*s.*, 15*s.*, and 20*s.* each and upwards.—Address, with money order, to JAMES BETTS, Florist and Seedsman, 7, George-street, Brighton.

NOTICE.—One Hundred packets of FLOWER SEEDS for 5*s.*, 50 for 3*s.*, or 32 for 2*s.* 6*d.*, sent free by post on receipt of Money Order. The Advertiser, having a very large Collection of really new and genuine Seeds, begs to offer them at the above very moderate prices; a small packet of 12 kinds will be sent for 12 stamps. A List of Flower Garden and other Seeds, with a sample packet, may be had for two stamps, from which the selection may be made. Also packets of Garden Seeds, free to any railway station in London, at 5*s.*, 10*s.*, 15*s.*, and 20*s.* each.—Address JOSEPH GOLDING, Seedsman, Hastings, Sussex.

RICHARD SMITH begs to call attention to the following New and desirable Plants, which will be sent out by him early in April.
PETUNIA ECLIPSE.—This is a very beautiful variety, which will give general satisfaction. The flower is large and of good texture; ground colour pale rosy flesh, very fully marked with rich crimson maroon veins, forming in their density and peculiar shape a perfect star in the centre of the flower; it is a free bloomer, of good habit, and unquestionably the most beautiful light variety hitherto sent out.
CACTUS (EPIPHYLLUM) MAXIMUM.—This is a hybrid, of enormous size, between Speciosissimus and Ackermanii major, of a bright deep red colour, slightly tinged with purple in the centre; it is very showy, an opinion of which may be formed when it is mentioned that the flower when expanded measures 10 inches across. See Notice to Correspondent "S.," *Gardeners' Chronicle* of July 5th, page 460.
Price of Petunia and Cactus, 5*s.* each. Where three or more are ordered of either or both they will be charged 3*s.* 6*d.* each.
Nurseries, Worcester, March 9.

FUCHSIAS AND VERBENAS, NEW AND FIRST-RATE.

WM. RUMLEY AND SONS have to offer 12 of the following newest and very best FUCHSIAS for 12*s.*, 20 for 18*s.*, or 6 for 7*s.*, fine strong plants, true to name, free by post, securely packed: Elegance, Eastern Beauty, Fire King, Elegantissima, Newtoniensis, President, Model, Chateaubriand, Royalist, General Negrier, Incomparable, Perfection, Challenger, Shylock, Gem, Tricolor superba, Julia, Grisi, Lord Nelson, The Rajah, Splendida, Snowdrop, Sir Charles Napier, &c. Spectabilis, 5*s.* each.
VERBENAS.—12 of the following newest and very best varieties for 6*s.*: Eclipse, Lord of the Isles, Attraction, Louis Napoleon Buonaparte, John Salter, Madame Ravencon, Marquis de Rodolfi, Madame Gabrielle de Vendeuve Marganyou, Princess Alice, Queen of Summer, Beauty of Stow, Napier, Cyclops, Julia, Magnificent, General Lamoriciere, Royal Purple, Iphigene, Lady of the Lake, &c.
GERANIUMS.—12 of the following extra fine varieties for 10*s.* 6*d.*, fine strong plants, hamper and package included: Blackmore, Beauty of Kent, Conflagration, Celestial, Geraldine, Prince Albert, Chef d'Ouvre, Lady of the Lake, Mayor of Yarmouth, Mayoress of Yarmouth, British Queen, Maid of Anjou, Princess Alicia, Favourite, Magog, Unit, &c.
The above will be forwarded to any part on receipt of a Post-office order, payable at Richmond. A Descriptive Catalogue of Fuchsias, Verbenas, Geraniums, Dahlias, Pansies, Stove, Greenhouse, and Bedding Plants, &c., may be had on application.—Gilling, Richmond, Yorkshire.

RENDLE'S TRUE WILLCOVE BROCCOLI.—*This superior variety has been proved by thousands to be the best late sort in cultivation, and can be recommended with much confidence. We have saved a small quantity this season on our own grounds, from some of the finest heads ever seen; price 1s. per packet, free by post.*
*** Twenty packets to the Trade for 12*s*, or 50 for 2*l.* 10*s.* It will give the most complete satisfaction.
Our commercial stamp is on each packet.
COLE'S SUPERB RED CELERY, 1*s.* per packet.
Apply to WILLIAM E. RENDLE and Co.,
Seed Merchants, Plymouth.

CHOICE FLOWER SEEDS.

W. P. AYRES begs to inform his friends that he supplies the whole of his FLOWER SEEDS in Ayres and Moore's Envelopes, with proper cultural directions. Free by post.

Brooklands Nursery, Blackheath, March 9.

THE TRUE "DURMAST" OAK OF THE NEW FOREST.—A large quantity of fine stout Plants of this esteemed species of Quercus, 3 to 5 and 6 feet high, 40*s.* to 80*s.* per 1000, may be obtained of WM. ROGERS, Nurseryman and Contracting Planter, Red Lodge, near Southampton, this being now the best season for transplanting them.

DWARF PEAS.

HAIRS'S Dwarf Green MAMMOTH KNIGHT'S MARROW PEA is perfectly distinct from any other in existence; grows 2 feet, is 3 weeks earlier than the old dwarf Green Knight's, and the Peas and pods are twice the size. 5*s.* per quart.
BISHOP'S LONGPOD.—Grows 2 feet high, early as Early Frames, pods as large as Scymetars, and 20 to 24 per stem. 2*s.* per quart.
LURBIGE'S ECLIPSE.—Grows 1 foot high, pods larger than Imperial, greater bearer, and altogether superior to that variety. 1*s.* per quart.
The above are three of the best Dwarf Peas ever introduced. Full particulars can be had of DUNCAN HAIRS, Seedsman, &c., Wholesale and Retail, 109, St. Martin's-lane, Charing-cross, London.
Catalogues can be furnished on application, and every article connected with the trade supplied on terms to defy competition. Garden Tools, Nets, Mats, Mushroom Spawn, and Potatoes saved from selected stocks at moderate prices.

Best English Red and White Clovers, Trefoil, and all other Agricultural Seeds of the best stocks at the lowest market prices. PRICED CATALOGUES of AGRICULTURAL SEEDS sent prepaid on application; also prices to the trade.

Post-office orders payable to BASS and BROWN, or to STEPHEN BROWN. Remittances required from unknown correspondents.

BASS AND BROWN, SEED and HORTICULTURAL ESTABLISHMENT, Sudbury, Suffolk.

RARE FLOWER SEEDS.

HIBISCUS SPECIOSA, A STOVE SHRUB.

Bears a profusion of scarlet blossoms, measuring 6 inches across.

ÆTHIONEMA MEMBRANACEUM, HARDY PERENNIAL.

Pink blossoms, which succeed each other in great profusion all the summer months.

MYOSOTIS AZORICA, SUMMER BEDDING PLANT.

This is the most beautiful of the "Forget-me-nots," dwarf habit, profuse bloomer, and flowers of a brilliant deep amethyst colour.

PENTSTEMON MURRAYANUM, HARDY PERENNIAL.

This is the most beautiful of all its genus. Flowers of a long tubular shape, and bright scarlet colour. Very scarce.

CALANDRINIA UMBELLATA, HARDY PERENNIAL.

Dwarf habit, flowers profusely, claret colour blossoms, which spangle in the sun like a Mesembryanthemum. Quite new, and most beautiful.

The above may be had of Messrs. HURST and Co., 6, Leadenhall-street; W. DENYER, 82, Gracechurch-street; Messrs. NOBLE and Co., Fleet-street; and the growers, Messrs. JEYES and Co., Northampton.

Messrs. JEYES and Co., have also to offer a fine stock of Dwarf Trained Moor-park Apricots, Standard Greengage Plums, seedling Berberis aquifolia, common Laurels, and Evergreen Privet, at very cheap prices.

BOTANICAL EXPEDITION TO OREGON.—The Committee are glad to announce that the state of the Subscriptions is such as to warrant their engagement of a Collector. They have succeeded in securing the services of a young Botanist of zeal and talent, and one who has already proved his capacity to deal with and overcome difficulties. In doing this they have trusted to the remaining shares being speedily taken up.

The Committee are also glad to state that their Subscription List embraces the name of Prince Albert, and of many distinguished persons in both parts of the United Kingdom.

The Lords of the Admiralty have been pleased to give instructions to the commanders of her Majesty's vessels in the Pacific to give every facility to the expedition.

Names of Subscribers will still for a short time be received by Prof. BALFOUR, Chairman; Mr. A. MURRAY, W.S., 15, Nelson-street, Edinburgh; and Mr. C. M'INTOSH, Dalkeith Gardens. No Subscriber will be liable beyond the amount of his Subscription. The Subscription is 5l. per share, but any number may be taken, and the Seeds sent home will be divided in proportion to the number.—Edinburgh, March 9.

KITCHEN GARDEN AND FLOWER SEEDS.

DESTRUCTIVE ANIMALCULÆ.

READ'S GARDEN ENGINES AND MACHINES.—As spring approaches, the larvæ of destructive insects are propagated in infinite multitudes, and impregnate with millions of insects the very air we breathe, to the great injury of the young shoots of trees, Vines, plants, and every species of vegetation put into motion and growth by the genial influence of the season.—RICHARD READ, Instrument Maker (by special appointment) to Her Majesty, begs to inform Amateur and Practical Gardeners, &c., that he has made considerable improvements in his Garden Engines and Machines, which are now so perfect that he will warrant the valves to keep in repair during the term of the patent. Manufactured only at 35, Regent-circus, Piccadilly.

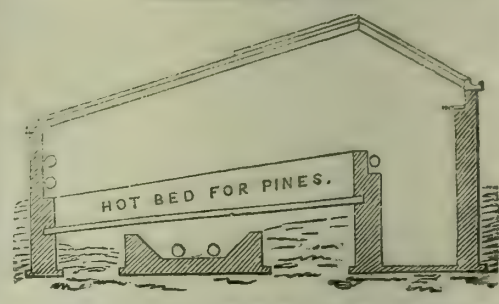
MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND Co. beg to notice their mixtures for laying Land down to Permanent Grass are now ready. The general satisfaction they have given for many years past, and the present low prices of 32s. per acre, allowing 2 bushels and 12 lbs. to each acre, they trust will ensure a continuance of orders. Mixed Seeds for improving old Grass Land, 1s. 3d. per lb.; fine sorts for forming Lawns, 1s. 4d. per lb. Their Priced List for the season of Turnips, Mangold Wurzel, and other Farm Seeds, will be forwarded on application to 26, Down-street, Piccadilly, London.

TO THE LOVERS OF FLOWERS.

COLES'S SOLUBLE COMPOUND ALKALINE POWDER.—Confidently offered as a most efficacious application for promoting the healthy growth and beauty of all kinds of HARDY OR TENDER PLANTS AND FLOWERS, requiring merely A SMALL TEASPOONFUL of it to be dissolved in every ENGLISH PINT OF WATER USED, and the solution to be applied occasionally, by means of a common rose watering-pan.

Sold, in GLASS BOTTLES of 1s. 6d., 2s., 2s. 6d., 3s. 6d., and 5s. each, by HENRY COLES, Seedsman, &c., 32, Cranbourn-street, Leicester-square, bearing his seal, signature, and address upon the corks and labels (without which none is genuine), of whom also may be had the celebrated



CARBONISED ANIMAL MANURE,

prepared, in like manner, specially for FLOWERS, perfectly free from smell, to be used in a DRY STATE, and sold in TIN CANISTERS of 1s., 1s. 9d., and 2s. 6d. each, or COMPACT WOODEN BOXES of 5s., by taking which, a considerable saving in price is obtained.

Wholesale Orders for the above, and the same prepared in a LESS REFINED STATE for AGRICULTURAL PURPOSES, FRUITS, AND VEGETABLES, also punctually executed, to any extent, upon application to the MANAGER at the MANUFACTORY, Middle Yard, Great Queen Street, Lincoln's Inn Fields, where may be seen analyses of the various sorts, made by Professor WAY (analytical chemist to the Royal Agricultural Society of England), and other eminent authorities.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

BOILERS OF ALL SIZES TO BE SEEN IN OPERATION. WARRANTED THE BEST.

J. WEEKS AND Co., King's-road, Chelsea, HORTICULTURAL ARCHITECTS, HOTHOUSE BUILDERS, and HOT-WATER APPARATUS MANUFACTURERS, solicit an inspection of their various Works completed and in progress. Horticultural Buildings of every variety. BOILERS of all sizes to be seen in operation, and which they warrant to be the most effective and economical of any in use. The largest size Boiler is now effectually heating three extensive ranges of Forcing-houses, 230 feet by 22 feet, all Span Roofs and lofty, containing upwards of 50,000 cubical feet of air. Also various small and intermediate size Boilers, some of all sizes in operation. The consumption of fuel is very moderate, and the fires will continue from 10 to 15 hours without attendance. The extensive arrangements now in full operation on their premises, enables them to build to any extent, and at very moderate prices. Hothouses, Greenhouses, Conservatories, Forcing-pits, Frames, Glass Lights, &c. A very extensive collection of Stove and Greenhouse Plants, which are sold at very low prices. Plans, Estimates, and Catalogues forwarded on application.

J. WEEKS and Co., King's-road, Chelsea.

CUCUMBER AND MELON BOXES AND LIGHTS.

One hundred 1, 2, and 3-light Boxes and Lights of all sizes ready for immediate use. Warranted best materials, packed and sent to all parts of the kingdom; 2-light Boxes and Lights from 1l. 4s. Garden Lights of every description, Conservatories, Green and Hot-houses, made and fixed in all parts of the kingdom. References given to the Nobility, Gentry, and the Trade, in most of the counties of England. JAS. WATTS, Hothouse Builder, Claremont-place, Old Kent-road, London.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street.

SLATE WORKS, ISLEWORTH.—The following articles, manufactured in Slate for Horticultural purposes by EDWARD BECK, may be seen in use at WORTON COTTAGE, upon application to the Gardener, Sundays excepted. Orange Tubs, Plant Boxes, Tanks, Cisterns, Shelves, Garden Path Edging, Hot Water Tank Covers, Flower-beds for Baiconies, Shelves fitted to hold water for Orchidaceous Houses, &c.

Estimates given for Work as shown upon Drawings and in Specifications. A large stock of Slate Slabs, of all sizes and thicknesses, kept on sale.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water, Drawings and Estimates made.—FREEMAN-ROE and HANSON, Hydraulic and Gas Engineers; Office, 70, Strand, London.

Works, Sumner-street, Southwark-bridge-road.

GLASS FOR CONSERVATORIES, &c.

HETLEY AND CO. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2d. to 3d. per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded, on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

VERBENA—"WONDERFUL."

G. MOORE begs to refer the readers of this Paper to his Advertisement of the 2d ult.

Perry Barr, near Birmingham, March 9.

HOLLYHOCK SEED, &c.

J. CHATER AND SON have for sale a few packets of Hollyhock Seed saved from their best named Flowers, at 2s. 6d. and 5s. per packet. Ditto mixed, from second rate flowers at 1s. 6d. and 2s. 6d. per packet.

Also One show PANSIES, 6s. to 9s. per dozen.

Nursery, Haverhill, Suffolk, March 9.

UNDER THE DISTINGUISHED PATRONAGE OF

SEVERAL INFLUENTIAL MEMBERS OF THE ROYAL AGRICULTURAL SOCIETY.

RENDLE'S DESCRIPTIVE CATALOGUE OF AGRICULTURAL SEEDS IS JUST PUBLISHED, and can be had on application, GRATIS (for one penny stamp).

It contains a descriptive list of all the best Field TURNIPS, *with the lowest market prices, also a full descriptive price current of all the best sorts of* CARROTS, MANGOLD WURZEL, CLOVER, *&c., as well as all the best varieties of Permanent Pasture Grasses.*

The following is an extract from the Catalogue.

Rendle's Imperial Purple-top Swede Turnip	...	per lb. 0s. 8d.
Ditto ditto	...	per qt. 1 0
Skirving's Liverpool Swede ditto, per lb., 8d.		per qt. 1 0
Laing's Improved ditto ditto, per lb., 8d.		per qt. 1 0
Purple-top Scotch ditto ditto, per lb., 8d.		per qt. 1 0
White and Green Globe per lb., 6d.		per qt. 0 10
White Belgian Carrot	...	per lb. 0 10
Yellow Globe Mangold Wurzel ...	...	per lb. 0 8
True Italian Rye-grass		per bush. 7 0
Best English Red and White Clover		per lb., 5d. to 0 7
Large Cattle Parsnip		per lb., 1s. to 1 6

With every other kind of Agricultural Seeds at the lowest market prices. (See Catalogue.)

PERMANENT PASTURE GRASSES, sold in mixtures to suit various soils, at 30s. per acre, allowing two bushels of light seed and 12 lbs. of heavy seed to each acre.

All orders above 2l. will be delivered free of carriage to any station on the Great Western, Bristol and Gloucester, Bristol and Exeter, or South Devon Railways; or to any town in Devon and Cornwall; or to Cork, Dublin, or Liverpool, by Steamers.

Railway and Steam communication to all parts of Great Britain and Ireland.

For Catalogues and further particulars apply to

WILLIAM E. RENDLE & CO., Union-road, Plymouth. ESTABLISHED 1786.

SEED POTATOES.

CHARLES SHARPE has much pleasure in announcing that he has got the under-mentioned sorts of POTATOES to offer again this season, which have for the last four successive years given general satisfaction in all parts of the kingdom. The first six sorts are very early and productive; those marked thus * are the best sorts for Frame Forcing; they are offered at the following prices, packing included:

Per bushel of 56 lbs.		Per bushel of 56 lbs.	
*Early Oxford Potatoes ...	8s.	Early Manleys	7s.
*Early Round Frame ...	8s.	Early Cockneys	7s.
Early Ash-leaved Kidney	8s.	Fox's Seedling	7s.

Second Early Potatoes for Winter and Spring use:

American Native Potatoes	5s.	Kentish Pink Kidney ...	4s.
York Regents	5s.	Forty Fold	4s.

Orders will be forwarded on the receipt of a Post-office order, and great care will be taken to ensure their safe delivery. A liberal allowance to the Trade.—Wisbeach, Cambridgeshire.

A. VAN GEERT, NURSERYMAN and FLORIST, Ghent, Belgium, begs to inform his friends and the trade generally, that his New Catalogue of Plants for 1850, is just published, and may be obtained on application to his Agents, BETHAM and BLACKITH, Cox and Hammond's Quays, Lower Thames-street, London.—Ghent, March 9.

TO NURSERYMEN, FLORISTS, AND OTHERS.

BETHAM AND BLACKITH (late JOHN BETHAM), CUSTOM-HOUSE, SHIPPING, INSURANCE, and GENERAL FORWARDING AGENTS, beg to inform the above that they continue to receive and forward consignments of Plants, Seeds, and General Merchandize, with due regard to economy and expedition. Constant communication maintained with all the Continental Nurseries, and information given respecting the arrival and departure of the vessels.—Address, Cox and Hammond's Quays, Lower Thames-street, London.

CEDRUS DEODARA OR HIMALAYA CEDAR. — The Subscribers beg to inform the admirers and planters of the above hardy Tree, that they have upwards of FIFTY THOUSAND, from one to five years old, in pots, grown from seed, constantly in the open ground, which they are now supplying on such terms as will induce their general introduction into all plantations, being of rapid growth, highly ornamental, and of great value as a Timber tree.

WM. MAULE and SONS, Stapleton-road Nurseries, Bristol.

GRIGOR'S AQUILEGIA GLANDULOSA.—The Subscribers beg to offer strong plants of this beautiful Columbine, post free, at 2s. 6d. per pair, or 9s. per dozen, and Seeds at 1s per packet, or for stamps of that value.

In the *Gardeners' Chronicle* of the 17th June, 1848, Dr. LINDLEY says, "This plant is perhaps the handsomest hardy perennial in cultivation."

True native Highland PINE and LARCH plants at unusually low prices. Early Prolific POTATOES for Seed, at 20s. per sack of 4 bushels, free on board.

JOHN GRIGOR and Co., Nurseries, Forres, N. B.

ORANGE, LEMON, LIME, CITRON, AND SHADDOCK TREES.—The first importation of the above Trees, in most excellent and healthy condition, has arrived from Italy. They are from 2 to 4 feet high in the stems, very straight, and possess strong grafts, and will make splendid trees in two or three years; from 12s. to 25s. each. They may be seen at A. COBBETT'S Italian and Foreign Warehouse, 18, Pall-mall, London. Also Catalonian, Azorian, and Arabian Jessamine Plants. The Double Italian Tuberose Roots are still on sale, 4s. per dozen.

UNIVERSAL CATALOGUE OF VERBENAS, FUCHSIAS, DAHLIAS, CHRYSANTHEMUMS, PETUNIAS, &c.

G. SMITH'S Priced and Descriptive Catalogue contains the very best selections of the above; with a useful note and a marked List of the best Verbenas for exhibition in pots, with mode of training, and what is of great importance to exhibitors, the time of stopping back, so as to catch a sheet of bloom when it may be required; with descriptions of his superb Seedling Fuchsias, Verbenas, Petunias, &c.; and will be forwarded on the receipt of one postage stamp.—Tollington Nursery, Hornsey, Islington.

CEDRUS DEODARA.

JOHN HENCHMAN has to offer 2000 strong seedlings of the above, from 4 to 6 inches high, in their pots, at 15l. per 1000: 25l. cash will be taken for the 2000.

Edmonton Nursery, March 9.

NEW AND STRIKING VERBENA.

ARTHUR MACKIE begs to offer the undermentioned to the attention of Florists, with the fullest conviction that it will give entire satisfaction.

WOODSTOCK'S MAGNIFICENT.—A. M. having purchased the entire Stock of this unrivalled Verbena, offers it to the Public with the utmost confidence, being fully persuaded that it will surpass everything yet out in its class. The individual flowers cover a sixpence, and sometimes a shilling. It is of a very free habit and growth, and well suited for grouping. See *Gardeners' Chronicle*, Sept. 15, 1849.—"*W. K. B.* Colour bright rose, fading to pink; a remarkably fine variety, with much the largest flowers we have yet seen."

Fine strong plants the 1st of April, at 5s. each, free by post. Where three are ordered four will be sent.

MACKIE'S Descriptive Catalogue of Flower and Vegetable Seeds is now ready, and will be forwarded on receipt of two stamps for postage.—Norwich Nursery, Norwich, March 9.

KITLEY'S GOLIAH STRAWBERRY.

JAMES KITLEY, in again bringing his SEEDLING STRAWBERRY before the notice of the Public, takes this opportunity of thanking those Friends who so liberally purchased in the autumn, and it being now the best time for planting, begs to inform them that he has a fine stock of healthy plants, which have been transplanted. See extracts from the *Gardeners' Chronicle*.

From the *Gardeners' Chronicle*.—"STRAWBERRIES: *J. K.* Your Seedling Strawberry, 'Goliah,' judging from its size and appearance, is worthy of cultivation."

From the Gardeners and Farmers' Journal.—"STRAWBERRIES: *J. K., Lyncombe Vale.* We have great pleasure in bearing testimony to the exquisite flavour of your Seedling Strawberry, 'Goliah.' In our opinion it combines the piquant flavour of the Strawberry with the richness of the Pine, the delicious aroma of which it partakes in equal proportion with the taste. Apart from the queen of fruits, we certainly do not remember anything in this way that conveyed to our senses so delicious a treat as the noble fruit to be known to the world as 'Kitley's Goliah Strawberry.'"

Plants, 12s. per doz., or 4l. per 100. A liberal allowance to the Trade in plants, when 100 are taken.

Cash orders expected from unknown correspondents.

Lyncombe Vale Nursery, Bath, March 9.

The Gardeners' Chronicle.

THE following example of AMATEUR FORCING is so instructive that we cannot do otherwise than bring it prominently into notice; for it shows, what few would suspect, that in spite of the advice, the warning, the teaching of so many excellent gardeners, for so many years, persons are still to be found who read without understanding, who act without thinking, and upon whom advice, warning, and teaching are wholly thrown away.

A correspondent, whose accuracy we have no reason to doubt, makes this statement; we give it in his own words:

"A gentleman whose garden I superintend once a week built a new pit for forcing Strawberries in, the plan of which I always objected to. It is as follows:—The pit is of the usual size, having five lights and 4-inch walls. It is heated by a single flue, running through the middle from one end to the other, and has a set-off in the walls for slabs to rest upon, so as to form a chamber below, from which the plunging material above is heated. In the last week in January the slabs were covered with a foot in thickness of half-decayed leaves, on which were laid about 9 inches of leaf-mould, to plunge the pots in. The pots were placed in the pit the same day on which the leaves were put in. A fire was lighted, but it was two or three days before it raised the temperature in the pit a single degree; and as I attended only once a week, as already stated, I left directions to increase the temperature two or three degrees weekly; but when I went again I found the bottom-heat at 90°, and the top 70°. I ordered the fire to be put out directly, and I gave plenty of air at top; but notwithstanding this the bottom heat remained at 90°. I had no fire on all night. I went the next morning and still found the bottom heat at 90°; this circumstance led me to examine the plunging material, and I found the moist heat in the chamber (for there was a small tank of water over the furnace, and perhaps that sometimes boiled, as it evaporated 5 or 6 gallons of water daily) had caused a violent fermentation to take place in the decayed leaves; consequently I had all the pots raised and placed on the top of the leaf-mould, leaving directions for them to remain in that condition till I went again; but when I returned, to my astonishment, I found them all replunged and rapidly approaching their former state. They had now been in heat about a fortnight, or rather more. I again requested the bottom heat to be reduced to 70°, and the top heat to 55° or 60°, with sun; and on going again the following week, I found the lights entirely off the plants, and they had been so for two days, exposing the plants to an external atmosphere of 40°. I remonstrated, but was told a nurseryman at * * had recommended it; I then examined the bottom heat with the lights off; it stood at 80°. I had them put on again, but so that the plants had plenty of air; before night the bottom heat was again at 90°. During the last week it has been at 80°, with about one-fourth of the plants dying, as I predicted they would under such treatment. Now, my employer will insist upon it that the soot at the bottom of the pots has killed the plants."

Here we have the case of Mr. SPRIGGINS in another and more startling form; but with this essential difference, that the ignorance belongs to the master, which is excusable, and not to the gardener, in whom it would be inexcusable.

It appears that the owner of these Strawberry plants, interpreting the word "forcing" literally, as signifying "to compel, to constrain," in January last took some Strawberry plants in pots out of the open ground and plunged them in a pit, the bottom heat of which rose to 90° in the first week, the top heat being 70°; that, in spite of the remonstrances of the gardener, this temperature had been maintained till, at last, the plants received a cold-air bath of 40°, the bottom heat still remaining at 80°. Then succeeded another stewing at 90°; and at last, when a quarter of the plants were dying, the unhappy gardener is charged with having killed the plants by putting some soot in the bottom of the pots.

Did not our editorial experience teach us that such events are not uncommon, we should have altogether discredited this story, so contrary does it seem to common sense and common fairness. The master may be laughed at for his folly in attempting to grow Strawberries by par-boiling their roots; the plants were his, and, if he had thought fit to bake them, he had a clear right to do so; and any public expression of opinion would have been uncalled for. But when he turns round upon the gardener who had endeavoured to stop the proceeding, and who was in every respect blameless, and gets up a ridiculous charge of his killing the plants with soot, the matter becomes serious, and calls for public interposition. Such an assertion, made in a little country neighbourhood, with some important part of the facts unexplained, may ruin, or most injuriously affect, the occasional gardener against whom the complaint is brought.

If the Strawberry killer in this case had at all understood the nature of plants he would have known these things; 1, that a *sudden* application of high temperature to Strawberries, especially to their roots, will always destroy a crop; 2, that under no circumstances will they bear 90° at their roots, while growing, without suffering; 3, that a moist heat of 90° at their roots is destruction; and 4, that soot is very commonly employed in potting Strawberries with beneficial, not injurious, effects. And then, if he could reason, he would have seen that the blame was his own, and nobody's else.

The Strawberry is a northern plant; the temperature of the soil in which its roots are naturally placed, is to be judged of by that of London, where some of its finest fruit is annually produced. Now it appears from the careful observations of Mr. THOMPSON, in the Garden of the Horticultural Society,* that the mean temperature of the earth there is in March 41°.16, in April 46°.17, in May 53°.49, in June 61°.14, about from 30° to 50° less than that employed in the case above related, which would have been excessive even for Pine-apples.

As it is impossible to run counter to the rules prescribed by Nature, without certainly missing the object aimed at, it would be superfluous to remark further on this occurrence, if it were not for the purpose of once more urging upon public attention the indispensable necessity of attending to ground temperature, a necessity less obvious in farming than in gardening, but not to be safely disregarded in either; for a soil may be too cold as well as too hot, and a crop of corn may suffer from the first, in the same way as a crop of Strawberries from the second.

"NOTHING in England surprises one so much," said a clever foreigner the other day, "as the total want of taste evinced in England in the interior of PLANT-HOUSES. Here and there indeed, as at Chatsworth, Syon, &c., we see a successful attempt at carrying out, under glass, those principles of decoration which the English so well understand in the open flower garden; but they are mere exceptions. One would think that the pleasure-grounds belonged to one nation, and the glass buildings to another. You have the finest cultivation in the world, the most magnificent plants, and the most varied forms; but you huddle them all together upon a stage or a shelf, just as if a greenhouse were a shop, and the plants were objects placed for sale upon the counters. We, on the contrary, have no such materials at our command, nevertheless observe how gay and varied

* Journal of the Society, vol iii., p. 99.

is the scene in many a Continental garden without half the pretensions of an English country residence. What, for example, have you in London that can be compared with the *Jardin d'Hiver* at Paris?"

We could not deny the justice of the criticism. What M. RIVOLIÉRE alleged was true, and deserves to be made a matter of consideration. Admitting this, however, we must also add that taste in the interior of plant-houses is far more studied than it was, and that in many places a considerable approach has been made to the combination of the useful and beautiful, as at Kew, in one of Mr. HANBURY'S houses at Poles, contrived by Mr. GLENDINNING, and in some houses in the garden of the Horticultural Society.

The reason why the English have preferred their homely way of arranging plants, has been the convenience of it. Their object has been high cultivation; to secure which it is desirable that every plant should be readily accessible and removable, so that, if any symptoms appear of bad health, they may be inquired into and arrested; and also in order that each plant may receive the treatment which is most suitable to its peculiar habits. Where plants are arranged in masses, in earth, or attached to stems, in irregular groups, this is not so easy to accomplish. Another reason for our English method has been economy of space; a point of the first importance so long as glass bore the exorbitant price attached to it before Sir ROBERT PEEL'S removal of the excise duties; and not to be neglected even now, with our excise on bricks and our duties on timber, to hamper the funds at the command of the garden architect. The Jardin d'Hiver, which Mons. RIVOLIÉRE quoted in illustration of his meaning, chiefly consists of a lawn, of Lycopodium, and winding walks, decorated here and there with plants in pots, grown in the style observable in the garden of the Royal Botanic Society. Properly speaking, this place is more of a lawn under glass than a flower-garden; but extremely pretty and tasteful no doubt. In England, however, a very moderate selection of fine plants would require half-a-dozen such houses to hold them.

While, then, we English have generally preferred utility to mere beauty, our Continental neighbours have often sacrificed solid value to showy decoration. But there surely is a middle course, which may be steered with advantage. While we teach them what high cultivation is, we may gladly learn from their example how the principles of high art may be applied to gardening, and the interior of plant-houses be rendered picturesque.

To effect this it is necessary to acquire a distinct idea of what tropical picturesqueness consists in, and to study the nature of those marvellous groupings of foliage to which we have no parallel in European scenery. We must give up, too, our excessive fondness for mere flowers, and learn to appreciate the value of the Ferns, and Palms, and Arads, &c. &c., to which a tropical foreground owes so much of its peculiar beauty. Those who wish to study the possibility of producing great effects by such means, should study the admirable work of KITTLITZ,* or any other faithful representations of tropical scenery. To explain what we mean we reproduce the frontispiece of "The Vegetable Kingdom," in which the accuracy of the details is guaranteed by the authority of VON MARTINS.

Nor is this at all impossible of accomplishment. A very near approach has been already made to such a scene by Mr. DILLWYN LLEWELLYN, to whose house we shall probably refer next week, when we explain, in some detail, how such a plan may be worked out without interference with the possibility of that minute and special supervision to which our English system has sacrificed so much. In the meanwhile we shall be thankful for any hints or suggestions which the experience of our readers may be able to furnish.

GRAVEL WALKS AND ROADS.

IN the very humid and comparatively sunless climate of England, nothing conduces more to the enjoyment of a country residence than a good, firm, and dry walk, upon the surface of which the ladies of a family can, without annoyance from dirt or damp, take their daily exercise. To be what it ought, it should be available immediately a heavy shower has ceased; and to this end it is desirable to get a hard smooth surface, and to carry off the surface water by frequent gratings to an underground drain, not allowing it to saturate the materials of which the walk is composed, or the ground on which it rests; because in proportion to the absorbency of the materials will be the unsoundness of the walk after severe frosts. Both road making and walk making are frequently ill understood by those who attempt it.

In the ordinary course of proceeding to form a road or walk, it is usual to make a deep excavation, which, when filled (as is usual) with large and coarse gravel, becomes a receptacle for the drainage of the adjacent ground, thus securing the greatest evil which can happen, by the constant saturation of its foundation. A better plan is to raise the edges of it above the adjoining surface, which keeps it dry. It is necessary that there should be 6 inches in thickness of gravel, for otherwise, however firm and good the surface might be, the worms would cast through and disfigure it.

Nothing can be a worse practice than the employment of large bodies of rounded pebbles at the bottom of a road or walk. After all, it is the native soil which carries the road, and if this is covered or roofed with materials which exclude the surface water, it will last; 4 inches of hard materials is sufficient; if pebbles, they should be broken so as to form a compact solid body, which they do when angular. Rounded pebbles, independently of the facilities which their interstices afford for the lodgement of water, are ever rising upwards; when pressed upon any point of their circumference, they move and become wedged by the falling of finer materials around them; and as this is always going on, in time they get to the surface, making it rough and uneven. In no instance should any great amount of convexity be given to the surface of a walk; its crown should not be raised above the level of the margins; if the water will just fall to the sides where the gratings are placed, it is all that is necessary; its outline cannot be too accurately defined, it is avowedly a work of art, and should have the impress of the nicest artistical execution in all its details.

However good the material which forms the face of the walk may be, the action of the atmosphere, alternate frosts and rain, will in time decompose the surface, in the same manner as it decomposes the hardest rocks, and by its slow but sure agency effects vast changes in the surface of the earth; the particles of earth absorb water, they expand by freezing, and when they thaw become soft and friable, presenting a fit nidus for Lichens, Mosses, &c., to vegetate in; but with a well-made walk we have only to scatter a little bright and fresh gravel on the surface, previously loosening it slightly, and it is restored to its former beauty. I have long discontinued the old practice of breaking up the walks deeply; and the more ancient one of leaving them roughly broken and exposed to the frost, snows, and rains of winter, cannot be too highly deprecated.

Asphalte and paving have both been recommended for forming garden walks, but I think there are few persons who would not prefer the bright warm colour of good gravel, where it can be procured. I have been in the habit of forming a sort of concrete with the gravel we get here, which answers well; it is well watered and rolled to the consistency of puddle when wet; it is afterwards allowed to dry, and sets as hard as a rock—the first shower of rain restoring it to its natural appearance.

Walk making, if well done, is very expensive; of course varying with the facility of obtaining fit materials; so much depends on their proximity to the scene of operations, or having to be carted from a distance, that perhaps no two places would come under the same estimate. Both walks and roads should be made upon the same principle—that of preserving a moderately thick stratum of angular materials from absorbing the surface water; and yet so little is this understood that thousands of tons of stone are yearly thrown into deep trenches, to form, as it is supposed, the foundations for roads and walks, while at the same time they, instead of supporting them, secure the most effectual means of making them unstable and rotten; let a dry surface be obtained—if not naturally, artificially—and cover it with a thin coat of such material as will keep it so.

In the present depressed state of the agricultural interest this may be worth the consideration of such of our friends of that class as purpose making roads; because, the principle admitted, must cause a much less quantity of ponderous materials to be procured and hauled than is usually done in forming farm roads; and as economy is the order of the day, this is one item in which a saving of outlay may be made where such labour is necessary. Whether it be in an approach road to the residence of a gentleman, or upon his farm, or in his garden, nothing is more satisfactory than well-kept roads and walks. In the wilder scenes of nature we can admire rugged and irregular paths, but in what immediately relates to the comfort and enjoyment of the family of the man of wealth and taste, we look for perfection, as far it is attainable by human means.
Henry Baily, Nuneham.

DISEASES OF PLANTS.

(*Continued from p.* 133.)

GENUS XIX.; *one species.* GANGRENE, *that is, a soft, moist, putrefying corruption.*—To this disease also may be applied what I have said of ulcers, that it may be considered as the last stage of some other disorder. It rarely attacks the stems of plants, but appears frequently in fruits, flowers, leaves, and roots. Plains of excessive fertility, and gardens, offer the most frequent instances of gangrene, especially in rainy, cold seasons. In my own little garden I have frequently observed it

* *Vierundzwanzig Vegetations-Ansichten von Küstenlandern und inseln des stillen Oceans.* 4to. Siegen, without date.

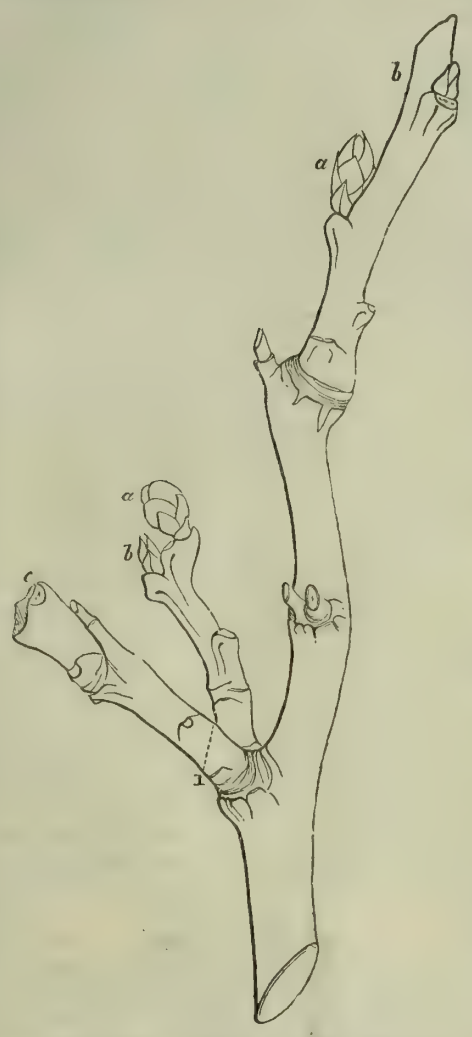
on Hyacinths and many other garden plants. As it is here that its does most damage, I shall first enter into some details on this case, and then speak of the gangrene in trees.

Flowers, especially Carnations, when cultivated by the fair sex, are much subject to this kind of corruption. The fear that ladies have lest their favourites should perish from starvation or drought, induces them to give a surfeit of the richest manures, with copious daily waterings. Thus treated, the plants grow with great vigour, but are soon attacked by polysarcia, followed by gangrene, and the disease is without cure when in an advanced stage. It is only when the first symptoms appear, usually some yellowish spots, that a remedy may be tried; although, if the spots are surrounded by a blackish sooty discoloration, it may be already too late. The only course to pursue is entirely to change the earth of the plant, placing it in a more appropriate drier soil without manure.

The gangrene of the Hyacinth requires some further mention. As already mentioned, it attacks the bulb, where it shows itself in the form of a circle, sometimes of a blackish hue, but generally of the colour of dead leaves, appearing sometimes near the top, sometimes near the base of the bulb. Corruption then spreads gradually till it reaches the surface, when the bulb is generally irremediably lost. The disease generally attacks the bulb when it is yet in the ground, and some indication of it may be given by the facility with which the stem may be detached from it before it is quite dried up. If the circular spot shows itself at the base of the bulb whence the fibres spring, there is no cure; if it be at the upper end, the gangrene may be cut out so as to stop its progress, the wound being sprinkled with ashes, and the bulb exposed to the sun's rays. The disease is contagious, and roots planted every year in the same place, without changing the soil, have appeared to me to be more especially affected with gangrene.

Seasons which produce polysarcia, and cause fruits to burst from over-repletion, will readily generate gangrene. During protracted rains we see fruits rot and putrify on the trees. The same effect may be produced by contusions. Gangrene in fruits is not only irremediable, but what is worse, contagious. It is well known how a sound Apple placed between two rotten ones will become affected likewise. The careful economist will prevent the disease by gathering his fruit before it is over-ripe, and so placing in the fruit room, that no one shall ever be in contact with another.

VILLA AND SUBURBAN GARDENING.



The successful cultivation of plants in pots depends in a great measure upon the proper placing of the materials employed in potting. The first condition essential to success is perfect drainage; if water-logged, no plant can continue long in a healthy state, whether it be in a pot or in the open ground.

The first thing to observe in potting is to place two pieces of broken potsherds over the hole in the bottom of the pot. Arrange them so that they may lay side by side. These pieces should have a slightly concave form, and the concave sides should be placed downwards; this will enable the water to pass off freely. The next point is the best kind of material to use above these pieces, and this is broken pots. For very small plants these may be reduced to the size of Peas, but they should be increased in proportion to the size of the pots. Four-inch and smaller pots would require the size mentioned, but from that to eight-inch pots may be drained with a coarser kind, say the size of Windsor Beans, and for larger pots, two or three times these dimensions will answer. The depth of the drainage must also be guided by the size of the pots—¾ inch will be enough for small pots, 1 inch for medium sizes, and for larger sizes 1½ inch and even 2 inches will occasionally be required. It is an error, however, to drain too much, as it must obviously be at the expense of the material in which the plant has to feed. A proper and careful regulation of the drainage is therefore necessarily required, in order that the object aimed at may be perfectly secured.

In collections in which little care has been bestowed upon the arrangement of the drainage, abundant evidence exists of the plants being in an unhealthy condition, an evil which arises not so much from an insufficient amount of drainage, as from a careless and injudicious application of it. Instead, therefore, of casting crocks into pots without thought or care, let them be regularly and evenly distributed. When this is done, the next point to consider is, how to maintain the whole in an efficient state. It cannot be maintained in that condition if the soil is thrust into the pot without any regard to consequences. Under such circumstances, it must be evident that the water supplied from time to time would soon wash portions of soil down amongst the draining materials, and render them ineffective. To obviate this, a little coarse turfy material should be carefully placed over them. If this is done with caution, the drainage will be perfectly and economically secured. *Pharo.*

PRUNING: THE QUINCE TREE.

On referring to the accompanying engraving, it may be remarked that in the preceding year, a blossom-bud, similar to those marked *a a*, and sessile like them, was situated at 1. In the course of last season that bud pushed a sort of shoot, furnished with leaves, and bearing at its extremity a single blossom, producing one fruit, which at its maturity had either been pulled or had dropped off, leaving a scar at *c*. The portion between 1 and *c* may be termed a branch, as it was furnished with leaves, and buds appear that were formed in the axils of those leaves; but still it is an imperfect branch, inasmuch as it has no terminal bud for its prolongation, the place of such bud having been occupied by the fruit. As this portion is only furnished with weak buds, it is not necessary to be retained, and should be cut off at 1.

a a, Blossom-buds; *b b*, Wood-buds; *c*, The place where fruit was attached last season.

In rearing the Quince tree, pruning is necessary in order to strengthen the stem, for otherwise it is very apt to be twisted or bent over by the winds. Presuming the tree has been planted in rich, rather moist soil, it will send up a long but flexible shoot; and if from this all laterals are pruned closely off, with the view of making a clean stem, the latter will be rendered much weaker than it would be if left to Nature. The plant should be cut back to within, say 18 inches of the ground, or more or less according to its strength. Generally three buds next the section will push in the following season; select the shoot best adapted for continuing the stem, and train it as upright as possible. Shorten this at the winter pruning, and spur in the laterals. In every successive year, a well-managed young tree of any kind ought to have an increased quantity of foliage; certainly not by any avoidable means should it be reduced to a condition under which it could only produce a decreased quantity. But such condition may be guarded against, and yet the stem can be cleared of such lateral shoots as may have been temporarily left to strengthen it and the roots, if their removal be gradually effected, of course from below upwards. A portion should be removed at every winter pruning, but the quantity should be more than compensated by that of the young shoots produced above in the preceding summer. By attending to this, and annually shortening the leading shoot, a stout stem, requiring no stake for support, will be the result. When the stem has attained the desired height, the formation of the head should be commenced. Three shoots, cut back at least to half their length, will afford two shoots each in the following season; and thus six principal branches will be originated. Afterwards very little pruning will be required. It will chiefly consist in early checking over-luxuriant up-starts, and thinning out cross-branches. *R. T.*

ONIONS.

All the varieties of the common Onion, even those considered the most distinct, are so easily modified by soil and climate, that one sort may produce what is here or elsewhere described as a different sort. It is possible that by saving seed from the palest bulbs of the Blood-red Onion, the Pale Red variety may be obtained; and by repeatedly saving from the palest of the Pale Red, James's Keeping may be obtained, and doubtless was so. Miller describes only three sorts of the common Onion, namely the Strasburg, Spanish, and White Egyptian; and he adds, "These varieties are not lasting; for if you save seeds of White Onions only, you will have a mixture of the Red ones amongst them; nor will the Strasburg keep long to its kind, but will by degrees grow flatter, as do the Large Portugal Onions when planted in our climate, which in a year or two will be so far degenerated as not to be known they were from that race."

1. *Blood-red,* aliàs French Blood-red, Dutch Blood-red, St. Thomas's, Oignon rouge foncé. Middle-sized, flat, deep-red, strong; keeps well.

Pale Red, aliàs Amiens, Rouge pâle ou de Niort. Similar to the preceding, but paler and not so flat.

2. *James's Keeping,* aliàs James's Long Keeping, Oignon Poire ou pyriforme. Large, pyramidal, outer skin brown; the second has a reddish cast; flavour strong; esteemed for its long keeping.

Madeira, aliàs Oignon de Madère, Romain ou de Bellegarde. Very large, roundish obovate, pale red; quality rather mild; does not keep long.

3. *Tripoli,* aliàs Besagnina. Resembles the preceding, very large, pale red, tinged with green and brown; soft and will not keep long; but whilst it lasts is much esteemed for its mildness.

4. *Strasburg,* aliàs Dutch, Flanders, Essex. This is the most generally cultivated sort; large, varies from flat to globular or oval; divested of its thick brown external coat, the colour is light red tinged with green; hardy, keeps well, but is strong. The two following are considered varieties of this.

5. *Deptford.* Skin thin, pale brown without any tinge of red; rather mild.

Globe. Skin rough, thick, pale brown with a tinge of red; hardy, rather mild.

6. *Spanish,* aliàs White Spanish, Reading, White Reading, Portugal, White Portugal, Cambridge, Evesham, Sandy, Oignon d'Espagne. Large, flat; outer skin loose, brown, falling off spontaneously, and exhibiting the next coat white tinged with green; considered the best for a general crop for early winter use; it is particularly mild.

Brown Portugal, aliàs True Portugal, Brown Spanish, Oignon jaune ou blond des Vertus, Catalogne, Cambrai, Oporto, Lisbon Viauna, Large St. Ubes. More brown than the preceding; in other respects very similar.

Lisbon, aliàs White Lisbon Florence, Oignon blanc de Florence, a variety of the following:

7. *Silver-skinned,* aliàs Large Silver-skinned, Large White, White Egyptian, Oignon blanc gros. Middle-sized, flat; skin thin, shining white; does not keep long, but is generally cultivated and esteemed for its mild quality, white colour, and for pickling.

8. *Early Silver-skinned,* or Oignon blanc hâtif. An early variety of the preceding.

9. *White Nocera,* or Blanc de Nocera, smaller and and still earlier than the Early Silver-skinned; excellent for pickling.

Fusiform Onion, aliàs Oignon fusiforme, Corne-de-bœuf, Druses Onion. From 6 to 12 inches in length, tapering and bent like a horn; does not keep well, and is, on the whole, more curious than useful.

Under-ground Onion, aliàs Potato Onion, Patate ou sous-terre. This forms its bulbs on the parent root, below ground; and comes in for use before any of the common Onions.

Tree Onion, aliàs Oignon bulbifère, à rocambole, Oignon d'Egypte; bears small bulbs, in clusters, on the stem above ground; being small, they may be employed for pickling.

The sorts numbered are either the best; or they possess peculiar properties which, in many cases, will render them desirable. Those who can only grow one sort should choose the Strasburg. *R. T.*

Home Correspondence.

Pond Mud.—I am much interested in the inquiries of "Ruris Amator," as to the best method of clearing the mud from ponds, and its value and proper application as a dressing for land. I have a large piece of water lying on flat ground, which is fed (for the most part in winter only, or in wet weather) by a small streamlet, the upper channel of which flows through uncultivated land of a light sandy texture. The water can be entirely drained off by a sluice at the lower end. It has not been cleaned out for some 20 or 30 years, and there is now more than 2 feet depth of mud in it. In fact, I have been deterred from making any attempt to clear it, by the certain expense and uncertain profit of the undertaking. I am aware that the best and most economical method of proceeding in cases where the width admits of it, is to work with the common hand-scoop, throwing the mud to the bank in one or perhaps two throws; but where there is a considerable area, and where the bottom is not hard and solid enough to admit of carting out, as in my case, there is a difficulty in performing the operation without some mechanical contrivance. Any information on the subject would oblige. *No Lover of Mud.*

Autumn Planting Potatoes.—On the 9th of August, 1849, a few Potatoes, the growth of the previous year, were planted in the usual manner in the open air. The stems were protected from frost by being covered with straw placed over loose stones, which were laid beside the plants. On the 26th of February, 1850, they were dug out, and the produce was abundant. The young Potatoes were each larger than a hen's egg, and very good food, being dry and having the flavour of new

Potatoes. The kind planted were what are called here "Baronets," and at the time of being planted were cut into four parts. None of the produce showed any appearance of disease. Are you aware of Potatoes having been grown in a similar way before, as to time of planting and age of seed? Would you recommend such a course for the purpose of obtaining a very early crop? Would the seed of the previous year be the best for forcing? *Martin J. Ffrench, Cashel, Tipperary.* [In some parts of England this is done regularly, for the supply of new Potatoes in winter. Old Potatoes are best for the purpose.]

Dendrobium speciosum.—A fine specimen of this handsome Dendrobe flowered in the garden of the Horticultural Society, in the spring of 1847, which was, I believe, the first time of its flowering there. Two or three words on the treatment it received during the spring and summer previous to blossoming therefore may not be out of place, more especially as they in part confirm the statement made by the Rev. Mr. Chawner's gardener, respecting the flowering of this plant. For two years before blooming it had been kept warm, and watered abundantly during the summer months; but, like other Orchids there, it was kept comparatively dry in winter. In the autumn of 1845 it was removed from the large curvilinear stove in the garden, and placed in an intermediate house (the old Pine stove), whose temperature was seldom higher than 45° in winter, and in summer it was as low as it could be kept, plenty of air being given, with occasional shading. Early in spring, while the plant was forming young pseudobulbs, an ample supply of water was given; but as soon as they had swelled out to their usual size, water was greatly withheld; in fact, it received no more during the summer than what was supplied by the atmosphere, or fell on it from the syringe. Under this treatment the flower-buds began to show themselves very prominently about August. I attributed its flowering to the low temperature in winter, and the drought in summer. *An Old Servant of the Society, Drayton, Feb.* 27.

Rhododendron zeylanicum.—This is now in great beauty in the open border, and proves to be a very fine thing, far surpassing, in my opinion, the old Rhododendron arboreum, or any of the numerous hybrid varieties that have originated from it. The rugged corky bark, and rough, wrinkled thick leaves, revolute at the margin, and clothed underneath with a somewhat rusty-coloured pubescence, give a peculiar character to the plant, by which it may be easily recognised. The head of flowers is round and compact, like that of R. arboreum, but the colour is much richer, being a deep blood red, with a few dark spots at the bottom of the tube. The plant we have under the name of R. Rollissoni I consider to be identical with R. zeylanicum [No doubt], although the former has not yet flowered with us. Both have been growing for several years in the open air, and although considered as being rather tender, they have been found sufficiently hardy to withstand 10 degrees of frost (the greatest cold experienced here last winter) without injury. *W. B. Booth, Carclew, Cornwall.*

Seedling Grape.—I exhibited at a late meeting of the Horticultural Society, under the initials "J. B.," two bunches of a dark-coloured seedling Grape, which is mentioned in the report of the meeting at p. 119. At p. 120 of the same Number you say "it is a very nice Grape, unknown to us. What are its history, its name, and its merits?" The bunches exhibited were from a seedling Vine, and were grown in a Pine-stove, in which there are a good many stove plants. In flavour we regard it as intermediate between the Black Hamburgh and West's St. Peter's, but it becomes more sugary the longer the fruit remains ripe before being cut. The length of time the Grapes will remain ripe on the Vine without spoiling forms one of its most remarkable characteristics. Those ripened last Midsummer were plump until about a month ago; and now that they are a little shrivelled, they are still in good condition for the table. We believe it to be a valuable addition to the varieties now in cultivation, and we intend to propagate it. *James Backhouse and Son, York.*

Peas.—You can do no one more good than the honest seedsman himself by reducing the number of Peas, Beans, or any other vegetables, within proper limits, and by telling the public that half those advertised under high sounding names, and which cause us much loss of time and much trouble to discover, are the same that have been grown and known for years past. At the same time your classifier may do much mischief where he intends otherwise if he should class together as identical (however botanically allied I don't pretend to pronounce) Peas or other vegetables which are decidedly dissimilar. I allude now to several sorts classed together in Mr. Thompson's list, and, with all due deference, assert erroneously. Among "Charltons," for instance, I find "Nimble Taylors." Every seedsman knows that these last are identical with Early Frame Peas; and any one sending "Charltons" for them would subject himself to an action. Scymetars and Imperials are classed together. Now every one knows that both in the shape of the pod, but above all in the time of their arriving at maturity, there is a difference of a fortnight—a long space in the calculations of a market-gardener, who has to send his produce to market; and there is no one more keen than the "podder" in knowing the difference of these two Peas. Emperors are put under the same head with Early Kent or Prince Albert; but they differ entirely in the habit of the Pea, and in the number of Peas in a pod, as you would soon learn to your cost, were you to be dependent upon their produce. These, and many mistakes like these, may do much mischief in our trade, and I fancy that either Mr. Thompson must have been deceived in the stock he tried, or that many which may be botanically the same, are, for all practical purposes, totally different, so that a list which, well arranged for practical purposes, might be a great boon to the vendor and the public, may, as it now stands, have just the contrary effect, making confusion worse confounded. Excuse, too, my surprise at your selection of Peas for your own eating. Where in it is that most useful, and by far the most used of Peas—the old Early Frame? This surely is indispensable in every garden, and there are two or three others for succession which I should recommend, but as tastes differ I will not enumerate them. Mr. Fleming, or one of your correspondents, is content with Hairs' Monster Marrow and Burbidge's Eclipse. Of the former I know nothing, but surely his is a wondrously small list, or his master cannot be very fond of Peas. *O. P.* [The "Nimble Taylor" is recorded as being the same as the Early Charlton in the "Transactions of the Horticultural Society," Second Series, vol. i., p. 376; and the Blue Scymitar the same as the Dwarf Imperial, p. 383. *R. T.*]

Rain at Pembroke from July to December (*inclusive*) 1849:

A friend who resides nearer the river makes the quantity recorded by his gauge larger by 2.58 inches. This may be in part the effect of a greater attraction by the river upon thunder clouds. *C. B. H.*

Birds.—I have reared green linnets; after they could pick they would not take an insect. I did not offer them any from under the Polyanthus leaves. I have seen robins, titmice, hedge and eave sparrows, on the last few sunny mornings, on my flower borders, in goodly numbers, feeding busily apparently upon insects, the sparrows turning over leaves in quest of them. I admit that bullfinches destroy buds, but I doubt whether those which they break off are not so broken in pursuit of insects or their eggs. Thrushes and blackbirds are kind friends to man; they work without pay, early and late, only resting (sleeping) about noon, when his little enemies also "hide their diminished heads." We may surely allow some of them to partake of our fruit; though I must say I have felt great disappointment when my Currants have been all stripped from the trees in three days, ere they had become red. Gooseberries have gone as surely but less quickly. Strawberries for two years have gone too, my feathered friends only taking the ripe or partially ripe ones. The first year it puzzled me to discover what took the unripe fruit, but my perseverance leads me to believe that much of it is taken by the shrew (Sorex araneus), though this little animal is said only to be insectivorous. I found at the entrance of several of its nests or runs heaps of Strawberries, from which every seed had been eaten. Upon a Rhubarb bed I found a full pint, ripe and unripe. I took them up, after removing a toad which sat close by them; I perceived the hole of a shrew under him, and this exonerated the good toad from the suspicion of being a participator in the theft. I removed him to the other end of the garden; next morning I paid a visit to the same spot, and there the toad was as before, with more unripe Strawberries before him. I removed him; two hours afterwards I went there again, and after taking him away covered the hole. During the day I repeated my visits, found and removed him oft, but the orifice was not cleared or more fruit added till morning, when the robbery was again laid at the shrew's portal. I also found upon a raised border, under a Cotoneaster microphylla quantities of Strawberries collected and the seeds eaten off, which was the case in three other places, where there were also burrows or holes. A pasture adjoining the garden abounds with shrews. One winter the gentleman occupying it entertained the idea that the more Grass left in autumn the better his next year's crop would be, and he would not allow it to be entered after the 10th of October. When it was mown in the following June he found out his mistake; the old Grass had smothered the young that would have been a crop, and had formed coverts for myriads of shrews. I do not think that in the 4 acres there was more than a foot between their runs. I have watched these animals carefully; they can turn about the snout or proboscis at will, and it appears as useful to them as the trunk to an elephant, and equally under their control. ♂

Societies.

Horticultural, *March* 5.—Sir Charles Lemon, Bart., M.P., in the chair. H. H. Calvert, Esq., of Erzeroum, was elected a Foreign Corresponding Member. Among subjects of exhibition, Mr. Packman, gr. to J. Gadesden, Esq., produced a magnificent specimen of the old-fashioned Bletia Tankervilliæ, now called Phaius grandifolius. It was 4 feet in height, measuring from the surface of the pot to the top of the flower-spikes, and about as much through. It had about two dozen flower-spikes on it, all in the greatest perfection, and standing well up, as they did, above the large healthy foliage, they had a striking effect. A Banksian medal was awarded it.—Mr. Loddiges, of Hackney, contributed a nice collection of Orchids, which consisted of the rare Cymbidium eburneum; the variety of Epidendrum Stamfordianum called pictum; Oncidium longifolium, a pretty brown and yellow Onion-leaved kind; Brasavola venosa; Zygopetalum intermedium; Phaius intermedius; the ever-flowering Phalænopsis amabilis; a charming rose-coloured variety of Odontoglossum Cervantesii, and various Dendrobes, chiefly varieties of D. nobile, from which, however, they differed more or less in colour; among them was a brilliantly coloured kind from Darjeeling, for which, as well as for the Phalænopsis and Odontoglossum, a Banksian Medal was awarded.—Mrs. Lawrence of Ealing-park sent a cream-coloured Mormodes new to gardens, for which a Certificate of Merit was awarded.—Mr. Davis, of Regent's-park, had a dwarf Eucomis called nana, not so attractive as E. punctata, and a cut specimen of an apparently small-growing species of Acacia, very much in the way of A. paradoxa.—Mr. Layton, of Hammersmith, produced a blue Cineraria with a white disc, called "Hammersmith Beauty," striking, on account of its fine bright sky-blue colour, but too small to rank among first class florists' varieties.—G. Glenny, Esq., exhibited a collection of Hyacinths, being what remained of 170 kinds which he had forced this season. Though blues certainly prevailed, examples of other colours were not wanting. One called Satellite was a brilliant lake, and very striking; and there was another especially worthy of notice, called Alida Catherina, a double flesh-coloured kind, dwarf and compact. Among Whites, one of the best was perhaps Mount Blanc.—Mr. Roberts, of Eastcheap, sent specimens of what were called "ventilating flower-pots." These had a hole in the side, near the base, instead of in the bottom, like other pots, and were furnished inside with a moveable perforated drainage tile or stage, placed so as to leave a cavity between it and the bottom of the pots, the object being to afford perfect drainage, and to admit air to the roots as well as to provide a place for liquid manure to be poured into instead of over the surface of the soil. Mr. Roberts is of opinion that whatever decaying substance is placed in the bottom in a liquid state "will produce slow combustion, and generate carbonic acid gas; that the latter will be taken up by capillary attraction, and that the roots will find themselves in the best possible condition to ensure the health of the plants." The real value of the contrivance, however, has yet to be proved.—A cast-iron socket for placing Rose poles, &c., in, to keep them from rotting at their bases, the invention of W. Everett, Esq., of Enfield, was exhibited. This socket has three divisions, or feet, which, being driven into the soil, serve to keep it steady, and it is intended to fasten the poles in the socket with pitch or some other material that will keep out wet. The contrivance appears to be perfect of its kind, and if it can be made cheap enough it will no doubt be found an acquisition.—The garden of the Society furnished Dendrobium nobile and the pendulous D. cucullatum, Cyrtochilum maculatum, Lycaste cruenta, the sweet-smelling Epidendrum virens, the spring Heath (E regerminans), a new and promising Boronia called microphylla, two Epacrises, Franciscea Hopeana and the much handsomer F. latifolia, a well flowered plant of the brilliant scarlet Inga pulcherrima, whose correct management is now becoming better known; Siphocampylus Manettiæflorus, a new and pretty species, with shining Myrtle-like leaves, and long red tubular blossoms tipped with yellow; the handsome hybrid Polygala, called Dalmasiana; the sweet-scented Swan River shrub Trymalium odoratissimum, three Acacias, and a handsome flower spike from the fine plant of Lælia superbiens now in blossom in the Society's garden.

Linnean, *March* 6.—The Treasurer in the chair. Mr. Yates exhibited a cone and drawing of the male plant of Encephalartos horridus, from the Duke of Devonshire's collection at Chatsworth. Dr. Wallich read a letter from Dr. Lehmann, referring to an account, by Prof. Liebman, of a species of Cycas in the Botanic Garden at Copenhagen, which produced perfect seeds in the absence of any male plant of this order. Mr. Newport communicated a paper on the habits of Monodontomerus, with some account of a new Acarus (Heteropus ventricosus, Newp.), "a parasite in the nests of Anthophora retusa." After confirming some

of the observations he had last year communicated to the Linnean Society respecting the larvæ of Monodontomerus, more especially that these larvæ are external feeding parasites, and that some remains of the destroyed bee are always found with them in the cell; and showing that, as mentioned in the communication of another naturalist, they feed on the bee nymph, as well as the larva, the author proceeded to detail the circumstances connected with his discovery in Sept. 1849, of a new parasite in the nest of the same bee. This was a microscopic Acarus, of the tribe Sarcoptides, of Koch, for which he proposed the name of Heteropus ventricosus, a new genus, the chief characters of which are derived from the anterior pair of legs being palpiform, and the three posterior pairs having articulated and pad-like tarsi, similar to those of the larvæ of Stylops. The characters of the species were supplied by the arched and robust form of the femora and tibiæ of the legs, which are clothed with a few very long hairs; and the name was suggested by the enormous size to which the bodies of the females become expanded after they have affixed themselves and begin to drain the body of the bee larva, or of its parasite of its juices. The economy of this microscopic Acarus was traced to a considerable extent, and the young, at the time of their first appearance, were stated to measure only about a sixteen-thousandth of an inch in length. Yet they occur in such abundance as quickly to destroy the young bee. Drawings of the impregnated, and of the unimpregnated Acarus, were exhibited, as also a collection of bee larvæ, covered in great abundance with the pregnant females in a living state.

Royal Institution, *Feb.* 1.—Professor Faraday described the results of the recent investigations of Peltier and Quetelet, on the electricity of the air. He explained the method hitherto generally adopted for ascertaining the electrical condition of the atmosphere, by using a long pointed rod, in connection with an electrometer; and stated that no satisfactory results could be obtained by such means. Peltier had adopted quite a different method, which was much more accurate. He employed a very delicate electrometer, the action of which was indicated by the deflection of a very small magnetic needle; and this was surmounted by a metallic ball, which was electrified by induction. With this apparatus the electrical condition of any stratum of air could be determined with relation to the earth, by raising the apparatus into the space to be examined, uninsulating the ball, and then bringing the electrometer to the earth again, and observing the amount of deflection of the needle. The first important result obtained by Peltier with this apparatus was, that the electricity of the air at any one period is the same at equal altitudes from the earth, no difference being indicated on moving the apparatus in horizontal directions, although marked differences are found in the strata above or below. In making these experiments, it is important that the instrument should be placed on some building higher than all surrounding objects. Another very interesting fact, established by Peltier, from five years' observation, is much more highly electrical in winter than in the summer. The following table indicates, by the numbers, the relative electrical conditions of the air in each month of the year.

January	605	July	40
February	578	August	62
March	200	September	70
April	141	October	131
May	84	November	209
June	47	December	507

It had also been observed that the sky is more highly electrical in clear than in cloudy weather, as indicated in the following table:

	Cloudy.	Clear.		Cloudy.	Clear.
January ...	... 268	... 1133	July ...	... 41	... 35
February ...	... 220	... 493	August ...	... 56	... 64
March ...	... 129	... 261	September	... 42	... 78
April ...	... 71	... 149	October ...	... 75	... 168
May ...	... 46	... 63	November	... 109	... 226
June ...	... 36	... 37	December	... 181	... 571

There was found to be a difference in the electricity of the air during fog, snow, and rain, as indicated by the following numbers:

Fog ..... 54 | Snow ..... 64 | Rain 35

From the Pharmaceutical Journal.

Garden Memoranda.

Mr. E. G. Henderson's Nursery, Wellington-road, St. John's Wood.—We observed in the show-house here flowering plants of Rhododendrons, Primroses, Cyclamens, Hyacinths, Tulips, Cinerarias, Spring Heaths, a nice white Epacris called Candida, but not near so large or fine as Hyacinthæflora candidissima, which is the best of all the white Epacrises; Kalmia glauca, and the Myrtle-leaved Orange, &c. The latter is very sweet-scented, flowers here profusely, and has altogether a neater appearance than the common Orange. We also noticed in the same house some small plants of the very fragrant Daphne indica rubra, which flowers freely, and stands cutting well. A plant of it has stood out all last winter in the open border here, quite unprotected, and it appears to be uninjured, although we all know the frost has been severe. Among Cyclamens, of which there are several varieties here, we remarked the little compact growing C. cöum quite a mass of purple flowers. In the Geranium-house was a dwarf growing dark scarlet Geranium, called Queen of Summer, which is reported to be a free blooming and very ornamental variety, partaking of the close habit of Tom Thumb. It has variegated stems, and a semi-variegated foliage, something like that of the old "transparens." Various Tillandsias and other plants are grown in the stoves here, in what are called "galvanised iron-wire baskets," suspended from the roof by a handle. Where the plants admit of it, as in the case of the Tillandsias, the surface of the basket is covered with Lycopodium denticulatum, which hanging down over the sides, gives the whole a finished and neat appearance. Among Tillandsias was a new one named Morreliana, from which much is expected. Of other subjects in baskets, we observed Achimenes cupreata, Campylobotris discolor, producing deep violet-purple berries, which are very ornamental all the winter; the two Lycopodiums, denticulatum and stoloniferum, to which might be added cæsium; and various Æschynanths. Among Gesneras, a scarlet one named macrantha purpurea was just coming into bloom; it has a nice dwarf habit, and is apparently a very free flowerer. Associated with it was a Gloxinia named "argyrostigma," remarkable for its clear silvery-veined leaves, which are very handsome; and along with it was another Gloxinia named leuconerva, which possesses the peculiarity of throwing up all its flowers from the centre of the plant unintermixed with the leaves. The blossoms are produced in abundance, and they somewhat resemble those of Caulescens in colour. Two variegated Hoyas may be worthy of notice; one named carnosa picta had leaves with white centres, surrounded by green; the other, variegata, had a deep green foliage, margined with white. In addition to the three kinds of Allamandas, viz., carthartica, grandiflora, and Schottii, usually met with, there was another here named Neriifolia, which is expected to turn out distinct and good, and along with it a new Centradenia called floribunda, said to be handsomer than rosea, and a deeply cut Palm-leaved Begonia ("luxurians") worth growing for the beauty of its foliage alone. We remarked several small plants of Tropæolum Deckerianum, a new kind, stated to have a red calyx, with green-pointed sepals and a purplish blue corolla; a new continental Lilac, called "Liberti," will also soon be in flower. It is reported to be a very distinct kind. Among Cinerarias, many of which were in blossom, the best six, to our taste, were Adela Villiers, Flora Mc Ivor, Cerito, Climax, Vulcan, and Carlotta Grisi. On a shelf, in the end of a greenhouse, a new Conoclinium was producing a fine head of Ageratum-like flowers of a pink, or rather bluish-lilac colour. It has a good foliage, and from what flowers we saw open, we should imagine it will prove an acquisition. The young stock in the pits was in excellent condition; it comprised, among other things, some thousands of the spring flowering Erica regerminans, which is about the only Heath that is found to force well.

Miscellaneous.

Professor De Candolle.—We regret to learn that in consequence of the state of political affairs in Geneva, the excellent M. De Candolle has given in his resignation of the botanical professorship of that city, and of the direction of the Botanic Garden there; both, we believe, created purposely for his distinguished father. It is, however, on the other hand, some consolation to know that this retirement gives him leisure, which enables him to promise a visit to his friends in England during the present year. *Hooker's Journal of Botany.*

Death of Dr. Koch.—We are sorry to have to announce the death of Dr. and Professor Koch, of Erlangen, author of the "Synopsis Floræ Germanicæ et Helveticæ," and of many other useful and talented botanical disquisitions. His Memoir on the Umbelliferæ, published in 1824, in the 12th volume of the "Nova Acta Academiæ Nat. Curios," contributed more towards fixing the limits of the genera on a true and firm basis than the works of all preceding writers on the subject; and his knowledge of European plants was surpassed by few. *Hooker's Journal of Botany.*

Port Natal Agricultural and Horticultural Society.—A society has been formed at Port Natal, which is situated to the north-east of the Cape of Good Hope, and is between the 28th and 31st meridians of east longitude, of which Mr. Edward Morewood is president, which offers prizes, to be awarded in July or August, 1850, for specimens of cotton, indigo, coffee, sugar, tobacco, Wheat, Barley, Oats, Potatoes, Onions, butter, cheese, ham, and bacon; also for the best essay on the cultivation of cotton and on the agriculture of the district—to the introducer of the greatest number of useful plants and seeds not previously introduced—for the best kiln for drying grain—for the best horse-hoe or ox-hoe for weeding cotton, and for the best drill-machine for sowing Beans and other seeds. *Country Gentleman.*

Planting Trees.—1. It requires two persons to plant a tree properly. 2. The soil should be well prepared by deep trenching; pulverised and made rich by compost manure, before the planting is commenced. 3. The holes for receiving the trees should be sufficiently large to receive the roots entire, without bending or crowding them. 4. Trees should never be planted more than an inch deeper than they were in the nursery. Deep planting is often fatal and always injurious. 5. All broken roots should be pared off smoothly with a sharp knife, on the under side. 6. The tree, when planted, should be held upright in the hole prepared to receive it, and the roots spread out into their natural position; the soil should then be carefully introduced around and between all the roots and fibres, until the hole is completely filled up. 7. After the tree is thus planted, press the soil gently, but firmly down with your foot. Water is not often necessary. If the season should be very dry, for some 7 to 10 days, after the planting in the spring, one generous supply of rain or pond water, that has been exposed to the rays of the sun for some 24 hours, may be beneficial, if some litter or other such material is placed around the roots at the same time. 8. Trees planted in the fall should not be watered—the autumnal rains will be all-sufficient. Newly transplanted trees are like silk animals, they want care and attention;—but little food, and no more water than will keep the soil moist. It should be borne in mind that a tree can be drowned, starved, surfeited, bruised, and in other careless ways brought to an "untimely end," or, what is worse, rendered "a cumberer of the ground." 9. The fall and the spring are suitable periods for transplanting all kinds of fruit and ornamental trees. Evergreens succeed best when removed in the spring. 10. I should prefer to remove large trees in the fall (although they generally do well when transplanted in the spring), as the earth, during the winter, becomes settled about the roots, and they are ready to throw out fibres in the spring. A few leaves, or some litter, should be placed around the stem of the tree thus transplanted, and some stones put thereon to keep the covering from being carried away by the wind. In June, the stones and litter may be removed. 11. The roots to large trees when transplanted are not generally as long in proportion to their size as to smaller ones; it is therefore best to take off a part of the top, to correspond in some measure to the loss of the roots. 12. When a tree has been a long time out of the soil, and becomes more or less dry—it is well to bury the entire tree, "root and branch," in the earth, bringing the soil into contact with every part of the plant, and let it remain buried for some 7 to 10 days. Some cloudy or rainy day take it up and plant it; this is much better than a cold bath for its roots, with the burning rays of the sun on its top, for 24 hours, as is sometimes prescribed. *The President of the Massachusetts Horticultural Society, in Hovey's Magazine of Horticulture for Jan.* 1850.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Orchids.—An increase of heat and moisture will now be required by the majority of this family; watch them carefully, and as they show signs of growth, place them in situations which are best calculated to produce a healthy development. Particular caution will be requisite to prevent moisture lodging in or about the young growths, as they are very liable to rot during that early stage. It is no less necessary to guard against slugs and woodlice; the young shoots and flower-stems are eaten by the former, which commit their depredations during the night, and must either be sought for at that time, or entrapped by slices of Carrot; the woodlice destroy the young points of the roots, and thereby prevent the plant from securing itself in its proper position. These enemies may be entrapped by halves of Turnips scooped out, or by placing a little hay between two plates or pans; the traps should be examined every morning, and the victims tumbled into a pot of hot water. Admit air with caution, and particularly avoid cold currents amongst the plants which have commenced growth; close early, and take advantage of the sun-heat on fine days, to indulge the plants with a gentle syringing. Avoid a high night temperature; 60° to 65° are sufficient for those in the most active state of growth. If there is only one house for the general reception of this family, the plants should be ranged from the warm to the cool end of the house, according to the natural habitats of the several kinds. The greater part of the Dendrobiums, the Vanda family, and some others, should, if possible, while making their growth, be removed to a higher temperature than that of the general house, which will contain the Oncidiums, Lycastes, Cattleyas, Lælias, &c. Get the shading in order, that it may be ready for use whenever it is required. We must not forget that many of the species are natives of dense forests, into which the rays of the sun never penetrate. These should be stationed near the back of the house, so that they can be shaded by partially unrolling the canvas, when it is not necessary, to shade those from more exposed localities.

FORCING DEPARTMENT.

Vineries.—As the succession and late Vines will soon be in motion, and as the ground is still cold, it will be of great advantage, where the roots are wholly outside, to afford them a gentle heat by laying tree leaves and stable litter over them to the depth of 15 or 18 inches. At the same time, the temperature within the house should be moderate, that the roots may make some progress before the buds begin to break. Care must be taken to prevent any injury to the tender skin of the young berries, as the disagreeable appearance known as rust is often produced by these means. Avoid handling the berries during the operation of thinning; and on no account permit a scalding steam to arise from the evaporating pans, as it is highly injurious to both leaves and fruit; and, as another necessary precaution, always give air before the sun's rays touch the house, early in the morning. Let the water used for syringing be quite clean, and of the same temperature as the atmosphere of the house. After the first general thinning, it should be discontinued, and the requisite amount of moisture obtained by evaporation. The syringing, if continued, will destroy the bloom of the fruit, which constitutes its chief beauty. Melons.—Attend to the training of the plants as they advance, and keep the shoots suf-

ficiently thin to enable every leaf to develop itself; maintain a moist atmosphere, or the red spider will soon make its appearance. Close early in the afternoon, and moisten the house and plants with the syringe. A small portion of air should be left on all night, to allow excessive evaporation to pass off, and thus prevent the first rays of the morning falling on damp leaves. Study well the state of the soil as to moisture. This is one of the main points in Melon-growing, especially during the swelling of the fruit. A medium and uniform state of moisture in the soil, a steady temperature, and air always, are indispensable in successful Melon-growing.

FLOWER GARDEN AND SHRUBBERIES.

The pruning of Roses may now be done with safety, and the operation should be brought to a conclusion as soon as possible. A distinction should be made between those families whose strong growths form wood, and those which produce flowers more freely on the strong than on the weak shoots. The latter consist principally of autumn flowering kinds, as Bourbons, Noisettes, Chinese and Tea-scented Roses. From these all the weakest wood, which is not likely to flower, should be cut away, and the stronger shoots shortened or thinned out, with the view to render the shape of the plant more symmetrical; for this reason the shortening should be proportioned to the strength of the shoots, reducing the weak wood to a few buds, to induce a stronger growth during the ensuing season, following the opposite practice with the strong shoots, and removing the very gross ones altogether. The summer blooming kinds do not flower on the strongest shoots of the same season; for which reason the production of exuberant wood should be as much as possible prevented. But if there are no objections against leaving unpruned the strongest shoots of last year, they will produce blossoms abundantly upon the laterals which proceed from them. If this is not convenient, it will be better to remove them entirely, to prune moderately the shoots of medium growth, and to leave the weakest entirely uncut. The less exuberant sorts may be pruned a little harder, and the very weak growing varieties harder still. A good deal will depend on the artificial habit of the plants, if they are trained against a wall or a pillar, many useful shoots may be retained, which would be objectionable in a standard, on account of appearance; but in both cases it should be a particular object to prevent anything like crowding amongst the shoots. By this time, many buds towards the points of the shoots have commenced growth; and, if early flowers are an object, a portion of these should be retained for this purpose, and by shortening the rest of the shoots a succession of blossoms may be produced. Avoid pruning too closely in all cases; if any error be committed, let it be on the safe side. It is no uncommon thing to see Noisette, Tea-scented, and China Roses entirely killed by being severely pruned. Standards of Hybrid China and Hybrid Perpetual Roses may safely be allowed to form large heads, when they look much more beautiful, and flower more abundantly than they do if pruned in close, as we often see them. Standard Roses, if of kinds with a drooping habit, should be worked on very high stems, and the long shoots allowed to hang down with their own weight. These kinds, along with the Banksian, Scotch, and Sweet Briar family, should not be pruned till they have done flowering. Dahlias, for general flower-garden decoration, should now be placed in a little heat; parted, and potted, as soon as they have made a few inches of growth. Marvel of Peru, Tigridias, Oxalis Deppei, Anomathecas, and other half-hardy roots may be started in a frame, and particularly the beautiful Salvia patens. If the stock of the latter is deficient, it may be readily increased at this season by cuttings from the strong young shoots.

FLORISTS' FLOWERS.

POLYANTHUSES.—It has often been a source of considerable speculation in our mind, how it is that so few novelties are produced in this class of plants. We appear contented with the same brown and yellow that were in vogue 20 years ago. Now in our experience during that period we have met with many seedlings which have exhibited fresh characteristics; but then they have been pin-eyed (to use a florist's term), when the very elongation of the pointal gives abundant opportunity for any one anxious to cross breed varieties to do so, while it would be attended with some difficulty if the stamens were most conspicuous (or the flower was thrum-eyed). We should not hesitate for a moment to save seed from pin-eyed flowers, if they had form, which is the *sine qua non* in our estimation, and we would leave it to the chapter of accidents after we had done our best—anxiously looking, however, for every fresh feature. PINKS.—Ours have suffered severely, and we have no doubt that it arises from having planted rather late; this, in conjunction with a severe winter, has made havoc amongst our plants; we therefore impress on our readers, from dear-bought experience, never to run the risk of spring planting, except to fill up vacancies. RANUNCULUSES.—After the very fine weather, no amateur can have any excuse for his roots being out of the ground. Dahlias and Carnations as in our last.

KITCHEN GARDEN.

CUCUMBERS.—That the fruit may be fine and abundant do not allow the vines or leaves to become crowded; take every pains to prevent the establishment of insects, especially of thrips, which must be destroyed by fumigating as soon as they appear. Let there be a constant circulation of air, and use every means to keep the house or pits sweet and clean. Take advantage of fine mild weather to wash the lights, which is rendered necessary by the very moist atmosphere necessarily kept up. Maintain the plants in a healthy state by top dressings of rich soil, consisting of loam, dung, and peat, if it can be obtained of good quality; or, in default of this, use about one-fourth leaf-mould. Prepare beds and plants for succession, according to the probable demand of the establishment. This week and next are very important ones in gardening matters, as many of the principal crops of the season require to be put into the ground; success will, in a great measure, depend on the condition the ground has been got into by winter digging and manuring, and by its being now in a good state of tilth for the reception of the seeds. Asparagus seeds should now be sown, and if the new beds for transplanting the two-year-old plants into are not ready, they should be immediately prepared, as they will require planting in most parts of England before the expiration of the present month; the right time for this purpose is when the young growths have started several inches. New beds should be set out 4 feet wide, and made good 2½ feet deep; the alleys between may be about 3 feet; of the old soil, the whole or a portion should be removed, according to its condition and quality, and replaced with some which is rich but not retentive; a sandy turfy loam, enriched with well rotted manure, is the best preparation that can be made in inland situations, but near the sea the kelp weed should be procured. Their natural habitat is the sandy shore, or the edges of rivers near their confluence with the ocean, always flourishing best where they are within the influence of salt water; we would not however recommend an application of salt at first planting, but would rather allow them to commence rooting first. Keep a careful eye to Cauliflowers under frames, &c., destroy insects, and harden the plants by using the protection as little as the weather will allow. Those from the frames, and the smaller ones from the handlights, where they were planted too thickly for standing, should be planted in favourable situations, in well enriched ground, and protected by means of evergreen branches. Spring sown Cabbage and Cauliflowers should be pricked out as soon as they are strong enough, and successional sowings made. Brussels Sprouts, Savoys, Curled Greens, &c., should now be sown for the earlier crops. Lettuce and Celery sown in frames some time since should now be transplanted, the latter into a prepared frame of light soil, and the former into a protected border for early use; successional sowings should be made of these, along with Radishes and other salads. A succession of Peas and Beans, Parsley, Spinach, and Turnips, should now be sown. Parsnips should be sown immediately in deeply trenched ground, with an additional small crop of Early Horn Carrots, and a small early crop of Beet. The main crop of Onions should now be sown, and a small bed of the Silver-skinned very thick, to produce small bulbs for pickling If the ground is rather stiff, the operations of sowing and digging should proceed together, that the soil may be left as loose as possible; but if light or sandy, it should be made moderately firm and compact by treading or rolling it after it has been dug; in the latter case it is most convenient to sow broadcast in beds, and rake the seed in; but in the former description of ground it is better to sow in shallow drills; the seed should not in any case be sown more than 1 inch or 1½ inch deep, and a liberal dressing of soot should be worked in along with it.

State of the Weather near London, for the week ending March 7, 1850, as observed at the Horticultural Garden, Chiswick.

March.		Moon's Age.	Barometer. Max.	Barometer. Min.	Thermometer. Max.	Thermometer. Min.	Thermometer. Mean	Wind.	Rain.

Satur. 16	51.6	35.9	43.7	9	0.25	—	5	4	—	4	7	3	1

The highest temperature during the above period occurred on the 10th 1833—12th, 1841; and 15th, 1829—therm. 67 deg.; and the lowest on the 10th, 1817—therm. 7 deg.

Notices to Correspondents.

ANTS: *J G.* Scald them with boiling water, or pour turpentine in their runs.‡

BEES: *A Reader.* We are of your mind, and shall make a change.

BLACK POPLAR: *W C.* You may strike it from cuttings now, made of the two-year-old wood.‡

DESCENT OF THE SAP: *J C H.* We cannot answer your inquiry in its present form. You have no right to catechise A, B, or C. If you have any remarks to make, and will put them into A SMALL COMPASS, we will insert them; but a newspaper is not the place for discussions in the form of dissertations. What is wanted is something short, true, and to the purpose.

FLOWERS: *Z Z Z.* Buy all the sorts of cheap annuals you can command, and try them. It is impossible to advise you without experience of the place. The longest Cucumber is the *Snake*, which is not a Cucumber at all. Try the Manchester Prizefighter.

FRUIT TREE WALLS: *J E M.* The most handy way of screening them is to rest poles aslant against the face of the walls, and to cast a netting over the poles. The latter may be put far enough from the bottom of the wall to allow a man to creep beneath the netting. Pyramidal Pear trees are best screened by tucking Spruce Fir branches among those of the Pear tree.

GREENHOUSES: *Anon.* Hyacinths, Crocuses, Narcissi, &c., in the spring. Camellias and Geraniums in pots—with a few Cinerarias and Fuchsias. To these you may add anything you like. The nearest nursery will always afford you something gay to add as other things go off.

HEATING: *Inquirer.* A cast-iron boiler will suit your purpose best.

LAURELS: *N.* You may layer them now; cuttings strike most readily in autumn.‡

LAWN: *A C S.* Add plenty of Crested Dogstail Grass, white Clover, and if the land is heavy, Medicago lupulina. Rake it, roll it, and give a slight dressing of soot.

MANURES: *Mechanic.* Bones and sulphuric acid will be most useful to green crops—as Cabbages, Turnips, Beet, &c. Their effect on white crops is uncertain, and generally unimportant.—*O P W.* We have no authentic information about "Copros." You had much better buy Peruvian guano of the best quality; it is certain in its quality, and far cheaper in the long run. Our experience makes us distrust very much all sorts of artificial manures; the makers themselves, with the best intentions, are unable to insure uniformity in them, except in the case of Lawes's superphosphate, which is invaluable for green crops.

MILDEW: *E S.* Sulphur will kill it if it is applied *the moment the mildew appears.*‡

MOTHS.—*Vine Moths.* On referring to our volume for 1847, p. 388, where figures were given of the transformations of the Pyrale de la Vigne (Tortrix Pillerana), it will be seen that in the foot note we doubted the identity of the specimens figured in Westwood and Humphrey's "British Moths," pl. 79, figs. 13 and 14, with the true T. Pillerana. We learn, however, from an article by Mr. Curtis, in the "Annals of Natural History" for the present month, that several specimens of the real Vine Moth have been taken by W. W. Saunders, Esq, at the back of the Isle of Wight, and that its larvæ will also feed on Stachys germanica, and in the capsules of Iris fœtidissima. We also take this opportunity of mentioning that we have also lately received from a correspondent a caterpillar feeding on a growing bunch of Grapes (to which it occasioned much injury), which appears from the nature of its ravages to be identical with the Cochylis Omphaciella of Faure-Bignet, figured in Prof. Audouin's fine work on the Vine insects. Our caterpillars have, however, unfortunately died. *W.—Pea Moth.* In the article above noticed, Mr. Curtis states that the Tortrix nigritana of Haworth is the Pisana of Guenée, and that it is the parent of the maggots in Peas, which he, as well as ourselves, have so long, but unsuccessfully endeavoured to rear. *W.—Plum Moth.* The Tortrix nigritana of Haworth must not be confounded with the nigritana of Kollar, the larvæ of the latter of which feed upon the flesh of the fruit of the Plum. Our English micro-lepidopterists have not hitherto been able to identify the Plum Moth, not having reared it from the larva; but we learn from an article in the proceedings of the Stettin Entomological Society, just published, that it is the Tortrix funebrana. *W.*

NAMES OF PLANTS: *P P.* Catasetum purpuratum is a whole-coloured variety of C. tridentatum; 5, C. rostratum is very near C. planiceps, but different; 4, C. Russellianum is C. Pescatoreanum, *Lindl. sp. n.*; Brasavola appendiculata is right; B. No. 26, Brazil, is B. cordata; 19, Inconnu is Peristylus citrinus; 17, Bolbophyllum variegatum; 18, Angræcum monodon, *Lindl. sp. n.*; Barkeria melanocaulon is right; 24, Eria stellata; 22, the dark variety of Lælia autumnalis; 8, Calanthe sylvatica; 12, Bonatea gabonensis, *Lindl. sp. n.*; 7, Cirrhæa pallida; 9, Sarcoglossum suaveolens is some Cirrhæa, and apparently C. tristis; 21, Coryanthes maculata. —*M D.* Ruscus hypophyllum, an Italian plant.—*Chichester.* Peziza coccinea.—*P P.* A curious thing: you shall know next week.—*Catherine.* Very sorry: but, as we have often stated, we really cannot spare time to name Mosses; very curious and interesting plants no doubt, but having no relation to gardening or rural economy.—*J P, York.* What morsels! Cyanotis vittata, Epidendrum virens, Lycopodium denticulatum and compressum. If you sent any others, we cannot find them. As to numbers there was not one.—*H C Z.* Daphne collina, or some hybrid from it. Strawberries next week.

PIPES: *J S L.* We do not approve of zinc pipes. There is nothing like iron.

PRUNING: *O L.* You should not allow your Spanish Chestnuts to form more than one main stem. This will be readily managed by shortening or stopping the laterals; and if the main stem once gets the mastery, the laterals will dwindle away, or may be readily removed. If the trees are very young, then the strongest laterals may be cut clean out; but pinching the ends when growing is better, until the main stem is in full vigour of growth. We never yet saw a book on pruning which we could call a *good* one.

RATS: *H D.* We have sent your inquiry to Mr. Kidd.

SARRACENIAS: *W S.* The following is Elliot's account of the interior mechanism of the Sarracenias. "Drummond's," figured in the new Number of Paxton, is a plant of exquisite beauty, to which the colourers have by no means done justice in that work. "It may be sufficient here to remark that the throat or orifice of these leaves is generally covered with a saccharine secretion or exudation. Immediately below the throat, for the space of nearly an inch, the surface is highly polished, while the lower part of the tube is covered with hairs all pointing downwards. When an insect attracted in the first instance by the secretion of the plant, or perhaps even by the water, descends, as it easily can do, along this declining pubescence, it appears incapable of ascending by its feet alone, and can only escape by a flight so perpendicular as to surpass the power of most insects. Whenever they touch the bristly sides of the tube they are precipitated again to the bottom, and have to renew their efforts; and many insects, even of a large size, perish in this arduous and hopeless struggle."

SEEDS: *Aleph.* We are sure that you will agree with us in the propriety of our rule not to recommend tradesmen. Any of the seeds named in the lists which appear in our columns may be had of the principal London seedsmen, or through their country correspondents. Depend upon it there is no better seed in Brussels than in London.

WINDOW BOXES: *Phlanthos.* Plant Tropæolum canariense at either end of the box, to run round the window, and sow the centre with Mignonette, if you want something sweet-scented; if not, plant it with different kinds of Verbenas.‡

WORMS: *Scowles.* Try lime-water.‡

MISC: *Enquirer.* The air should enter at the end most remote from the door, and be 180° when it passes the aperture. Gladiolus cardinalis is tender, and can only be planted out when frosts are gone. Climbing Roses?—yes. The Ne Plus Meuris Pear does *not* require a wall near London.—*W E.* It is not too late for your Cinerarias to flower yet. Put six plants in a pot of Rhodanthe Manglesii; one is not enough.‡ —*Stocktonensis.* Place your Cucumber trellis about 9 inches from the glass.‡—*Sub.* Woollen nets make the best spring protection for fruit trees on walls.‡—*Reader.* The varieties of Japan Lily are hardy round London. Your Camellias have received some check, which has made them cast their flower-buds: you have possibly kept them either too wet or too dry.‡

TO OUR CORRESPONDENTS.—May we beg it to be understood that *we cannot answer inquiries privately through the post.* We are ready to give reasonable information through our columns, but we cannot consent to the labour of writing letters.

HOT WATER APPARATUS AND HORTICULTURAL BUILDING.

W. HILL begs respectfully to announce that his improved "FLUE BOILER" may now be had in sizes to suit every description of Apparatus, from that of 100 feet to 2000 feet of 4-inch pipe. Improved STEAM BOILERS, from one horse-power and upwards, adapted either for stationary or portable engines, and guaranteed to be most effective.

Every description of Horticultural Building constructed upon the best principle. Buildings of any kind heated by hot water.

*** A liberal Discount to the Trade.

W. HILL, Horticultural Works, Greenwich.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses when completed charged from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle, the roof is formed without wood or putty, and on another principle with wood rafters and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per ft.

HEATING BY HOT WATER.

THE LONDON MANURE COMPANY beg to offer as under, and pledge themselves that every Manure shall be perfectly Genuine:—Corn Manure for Wheat, Barley, Oats, Clover—most strongly recommended from its success last year; it will be found cheaper than Guano, and bear the strictest analysis. Also URATE, Superphosphate of Lime, Sulphate and Phosphate of Ammonia, Nitrate Soda, Fishery and other Salt, Gypsum, Sulphuric Acid, &c.

GENUINE PERUVIAN GUANO.—To insure this free from adulteration, all purchasers, if they prefer it, can receive their warrants from Mr. Purser, and remove the Guano direct from the Warehouses of Messrs. A. GIBBS and SONS, the Importers.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.

Country Dealers and Agents supplied.

GENUINE PERUVIAN GUANO, direct from the Importer's Stores, LINSEED CAKES, and all kinds of Artificial Manures, may be had at London prices, for Cash, of Messrs. ODAMS and PICKFORD, 15, Mark-lane, London.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS

London, March 9.

POTTER'S GUANO. — This effective MANURE, now greatly Improved, is confidently recommended as a Dressing for all Spring Crops. It is equal to Peruvian Guano, and 25 per cent. cheaper. Also SUPERPHOSPHATE of LIME, GYPSUM, and SULPHATE of AMMONIA, all of guaranteed quality, and Cheaper than at any other establishment in town or country.

Factory, 28, CLAPHAM ROAD PLACE, LONDON.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

Corn and Grass Manure, per ton	£10 0 0
Clover Manure, do.	11 0 0
Turnip Manure, do.	7 0 0
Superphosphate of Lime	7 0 0
Sulphuric Acid and Coprolites	5 0 0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

LAWES'S PATENT MANURE.

WILLIAM E. RENDLE AND CO., Plymouth, are Mr. Lawes's Wholesale Agents for the Sale of his MANURES, and can supply them at Mr. Lawes's prices, delivered at his Factory, Deptford Creek.—Apply to WILLIAM E. RENDLE and Co., Union-road, Plymouth.

GIBBS' GENUINE PERUVIAN GUANO, *warranted*, at 9*l.* 15*s.* per ton. In the Import Docks.

SUPERIOR BOLIVIAN GUANO.—This Guano is of a very superior quality, of a pale straw colour, and in the highest state of preservation. For the last five years the Worcestershire Agricultural Society has awarded the prize for the best 2 acres of Swedes grown with Guano only, to parties who have made use of this description of Guano. It has been analysed by Dr. ANDREW URE, London; and WM. HERAPATH, Esq., Bristol.

Dr. ANDREW URE remarks: "The best Peruvian Guano is inferior in power and value to this Guano as 17 is to 24. It is the pure excrement of the birds."

W. HERAPATH, Esq., states: "One pound of this Guano is equal in fertilising power to nearly 40 lbs. of Farm-yard Dung. Judging from its nitrogen alone, it is a very rich Guano."

Apply to H. and G. WEBB, Merchants, Worcester, who also hold a cargo of the same kind of Guano in Liverpool and in Glasgow.

CORN MANURE.

BLASHFIELD'S PATENT COPROS.—A new Manure for Corn and other Crops, prepared from the nitrogenous matter deposited on the banks of the Thames, in combination with other substances essential for the growth of corn, &c., price 8*l.* per ton. Sold, in a finely ground state, at No. 3, New London-street, Mark-lane; also, at the Works, Mill-wall, Poplar; Waterloo Dock, Lambeth; and No. 1, Praed-street, Paddington Basin.

PATENT COPROS, for Corn crops, also for Turnips, &c.; Superphosphate of Lime, Gypsum, calcined and saturated with liquid manure. CEMENT for Liquid Manure Tanks, Malt House Floors, and Barn-floors, manufactured by J. M. BLASHFIELD, successor to Wyatt Parker and Co., Original Patentees—Parker's Cement. Established 1796. Drain Pipes, Tiles, &c.

SILVER SAND, PEAT, &c.—REMOVAL.

EDWARD KEMP begs to thank his numerous friends for their kind support during the last seven years, and informs them that he has removed to No. 16, Ann's-place, East-street, Old Kent-road, where he respectfully solicits a continuance of their favours.

IMPORTANT TO AGRICULTURISTS.—COLLECTION AND DISTRIBUTION OF MANURES.

STRATTON'S AGRICULTURAL REPOSITORY, BRISTOL.

STRATTON, HUGHES, AND CO., have now ready their PATENT TUMBLER CART for the collection of Night-soil and other offensive matters; also their Iron Mill, to be worked by horse-power, water-power, or steam, for mixing and incorporating Nightsoil with Charcoal and other deodorisers. The Tumbler Cart has an iron body with a close cover; can be fitted if required as a Watering-cart, with a Valve and Delivery Pipe for distributing water or liquid manure, and also with an Apparatus for distributing dry manures in any given quantities per acre.

STRATTON, HUGHES, and Co.'s Tumbler Carts are used for scavenging purposes in Manchester, Bristol, Worcester, Harwich, Rochford, Cardiff, &c., and they are now building them for Chester, Oxford, Huddersfield, &c., besides many for Agricultural Colleges and private individuals. STRATTON, HUGHES, and Co.'s new illustrated Catalogue of Carts, Waggons, and Agricultural Implements will be forwarded to any address on receipt of 1*s.* 6*d.* in postage stamps.

HYDRAULIC ENGINES, WATER RAMS, &c. on Improved Principles; Engines worked by Steam or Hydraulic power, to raise from 1 gallon to 1000 per minute to a height of 500 feet, and from a depth of 900 feet. Douche, Vapour, Hot-air, and all other kinds of Baths. Buildings Conservatories, &c., heated by Steam, Air, or Water. Boring, Sinking, and Collecting of Water, &c. Towns supplied.—Direct to JOHN LEGG, Cheltenham.

FLEXIBLE INDIA-RUBBER HOSE PIPES.

JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING. These Pipes are well adapted for watering Gardens, conveying Liquid Manure, for Breweries, Gas Fittings, Chemical and all purposes where a perfectly sound WATERPROOF and FLEXIBLE PIPE is required. Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently flexible in all temperatures, and are therefore particularly suitable for Fire-Engines; and from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes. Being extremely portable, stowing closely without danger of injury, resisting the influence of climate, insects, and vermin, frequently so injurious to such articles on board ship, and retaining their virtues though long out of use, render them particularly adapted for exportation.

N.B.—VULCANISED INDIA-RUBBER GARDEN HOSE, fitted with Roses, Jets, and Branches, complete, with Union Joints, ready to attach to Water Cisterns.

All letters or Orders addressed to J. L. H. at the Manufactory and Warehouse, Goswell-mews, Goswell-road, London, will meet with immediate attention.

The Agricultural Gazette.

SATURDAY, MARCH 9, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, March 13—Agricu tural Society of England.
THURSDAY, — 14—Agricultural Imp. Society of Ireland.
WEDNESDAY, — 20—Agricultural Society of England.
THURSDAY, — 21—Agricultural Imp. Society of Ireland.
FARMERS' CLUB.—March 22: Hadleigh.

WE feel called upon to enter upon some analysis of the important volume,* alluded to last week, from the pen of Mr. JAMES CAIRD, of Baldoon.

The subject is of great interest to those farmers who, from any cause, may desire to emigrate from their country: and however suspiciously a statement might be received at this side of the Channel in favour of immigration to Ireland, no suspicion can be fairly attached to the able report of this Scotch gentleman, which bears internal evidence of a disinterested and correct judgment.

It is gratifying to learn that notwithstanding the partial desolation of the Irish soil, and the general pressure upon the landed interests, there are to be found in Ireland both landlords and tenants whose farming is of the highest order. Among the former there are many who manfully maintain their position and perform their duties. We are tempted to give a few instances of this from the pages before us, before we proceed to the far west, which will be the main point of the present notice. Mr. ST. JOHN JEFFRYES, of Blarney Castle, near Cork, cultivates about 2000 acres of his own estate in a very perfect manner. He maintains also a very large and prime stock, by the aid of 300 acres of irrigated meadows, and is about to adopt Mr. HUXTABLE'S plan of house feeding sheep. After having spent many years in bringing these farms to their present high state of improvement, Mr. JEFFRYES would not object to subdivide and let them to skilful and spirited tenants. It is not, however, either surprising, or by any means rare, to find examples of high and complete farming near the populous cities, but we find them also in the remotest district. The estate of Mr. HERBERT, of Mucruss, near Killarney, is, it appears, in a very improved condition. Mr. CAIRD saw there some Turnip crops "which would do no discredit to the best farm in East Lothian." His tenants, however, are dairy farmers, "which is probably the safest system that can be followed in their circumstances; they are comfortable, pay their rents with regularity, and there is no unoccupied land on this estate—a statement which cannot, perhaps, be made of any other considerable estate in the county" (Kerry). Mr. CAIRD attributes the happy circumstances of that property to the fact that Mr. HERBERT has for many years made it his study to understand and discharge his duties as a landlord: he also provides suitable farm buildings for his tenants—which is one of the exceptional cases in Irish landlord management.

We shall glance also at the case of Mr. CHRISTIE, a tenant farmer in the County of Limerick, who went from East Lothian to that neighbourhood 30 years ago. He holds two farms, one of which contains 400 Irish = 640 English acres. The extent of the other is not stated. He pays from 20*s.* to 30*s.* the English acre—besides poor rates and Grand Jury cess—and built his own farm-steading, and executed the fencing and draining also at his own expense. The people there are represented by Mr. CHRISTIE as well disposed and grateful for employment.

On large tracts of the finest soil of that county Mr. CAIRD found that no attempt had been made at high farming. The landlords have not the means of erecting proper farm buildings. This deficiency in fact presents throughout one of the greatest difficulties which any tenant farmer or purchaser will have to contend with. For though rich land at 30*s.* an acre, including all rates, may appear very cheap, yet if a great outlay be required for buildings, the case is reversed; and, upon this point, our author suggests the expediency of great caution in making offers for farms anywhere. We were until now in ignorance of the extraordinary manner by which tenants were enabled to get on without capital, when they had needy landlords to deal with:

"When a man manages to save 100*l.* or 200*l.* he goes to a landlord and offers a certain rent for a farm, backing his offer with all the capital he has, as a *douceur* or fine in hand, to induce the landlord to accept his terms. The offer is accepted, and the fine paid. Having thus exhausted his capital, the tenant then advertises that on the following Sunday he will set out a certain field for Potatoes. Several hundred people assemble, and each marks out the piece he wishes to have. A rent is fixed for it, possibly 10*l.* an acre (Irish), one-third of which must be paid before breaking the ground, and the other two-thirds before removing the crop. The tenant thus gets all his rent out of, perhaps, the fifth part of his holding. The same is repeated on the same field a second, and sometimes a third year, after which the tenant takes two or three crops of Oats, and then lets the land rest to recover itself. This process is pursued with other parts of the land till all is gone over, by which time the first is ready to begin upon again. The money paid in advance by the Potato-renters enables the farmer, with what credit he possesses, to stock the rest of his land, and in this way he manages to carry on without capital. But the Potato failure put an end to this rotten system; and the tenant who depended on it, and the landlord who was enriched by it while it lasted, are now equally helpless."

We cannot spare space to dwell upon the great merits of some other landlords in Munster; on the vast employment given by Mr. ST. JOHN BLACKER, near Tarbert, on the river Shannon, and on the pipe tilery which he has established; on the able management of Lord DEVON'S estates at Newcastle, and on the singularly effective improvements executed by the Misses GASCOIGNE, on the most extensive scale, in the county of Limerick.

Though there are many excellent landlords in the richest part of Munster ready to give reasonable encouragement to British or native farmers with capital, and either to guarantee that rates shall not exceed a fixed maximum, or pay them altogether from their own pockets, we must hasten on to the consideration of those portions of the work which bear upon the "plantation in the west;" and for this purpose we shall proceed with the author directly from Dublin to the heart of Connaught, not pausing to notice intermediate localities.

Mr. SPENCER LINDSAY, of Hollymount, county of Mayo, a decided improver, would let a farm of 400 acres of "rich, dry, hazelly land, admirably suited for sheep, intersected by good roads, and in excellent condition, and build the necessary farm-house and steading for a tenant of capital." Another farm of the same extent, in the same locality, which "forms quite an English scene," is also to be let. There are upon this farm, the greater part of which has been long in Grass, some farm buildings, originally designed for an agricultural school. The proprietor would complete them, and execute the draining that may be still required, and would "let the farm on a 19 or 21-years' lease, taking upon himself all rates and burdens whatsoever, at 25*s.* per English acre. Land of such quality, fenced in a way that we have no notion of in Scotland (with 5 feet of stone and lime walls), having abundance of lime and limestone, gravel beneath the surface, and plenty of turf to burn it; with a convenient homestead in a good neighbourhood, and the high road to Dublin as one of its boundaries, would be taken up at once at this rent in Scotland." A little farther south, one farm of 1000, or two farms of from 400 to 600 acres, with house, garden, and all suitable buildings, may be had. As it is capable of great improvement, Mr. CAIRD has "not a doubt of its proving an excellent investment to some tenant of capital and skill."

One of the peculiar advantages attending this, and many farms in the "far west," is, that it

* The Plantation Scheme; or, the West of Ireland as a field for investment. By JAMES CAIRD. Published by W. BLACKWOOD and SONS. Edinburgh: 1850.

contains within its area some of those periodically flooded lands, provincially called Turloughs, which generally consist of alluvial soil of the finest quality, the silt and *debris* for ages of a limestone country, and covered with a thick sward of Grass, which by the closeness with which it has been eaten indicates the rich feeding qualities it possesses." In many parts of Connaught the arterial drainage executed will permanently relieve most of these Turloughs from the water, which by bursting to the surface from limestone underground passages, inundated the low lands to a vast extent, and rendered them useless, except in the summer season.

Our tourist next inspected a farm of 500 acres within three miles of the upper end of Lough Corrib. "There is no wood here, but the stone walls are even more than usually substantial and good. The greater part of this farm is the finest feeding land for sheep and cattle—dry, friable, undulating land, all on limestone. The fields of rich old Grass are superior to anything we have, except in small patches, in any part of Scotland I at present remember. The best of it is too good for tillage, but about one-half of it might be profitably brought under the plough. The sheep and cattle then grazing on it were excellent. This is a very desirable farm, though the neighbourhood did not appear so inviting as in any of those which I had previously visited. The proprietor would erect all necessary buildings; and as there are none at present these could be constructed on the most approved plan. The present rent paid for this farm by an extensive grazier, an excellent tenant, is not more than 25*s.* per Irish acre, the owner paying all rates of every kind." As it is expected that the water communication with Galway through Lough Corrib will be open in two years, the lands adjacent to this Lough will obviously be enhanced in value, and the line of railway from Galway to Dublin will, it may be presumed, give an increased worth to all the tillage and dairy farms throughout the whole districts through which that important channel of intercourse will pass. Some of the soil which Mr. Caird examined in his day's ride from Hollymount, has a uniform depth of 18 inches, with limestone, sand, and gravel underneath. This locality in Mayo is described in the most tempting manner; "The winters are mild, and the climate most suitable for Grass and green crops; the soil is in every way adapted for feeding of green crops, if desirable, or for finishing sheep and cattle for the fat market. The milk and butter are of the richest quality. Labourers' wages are at present from 8*d.* to 10*d.* a day; the people most peaceable and very intelligent, though negligent and idle to an uncommon degree if not carefully superintended. Land may be dug over by contract, 12 inches deep, all the large stones laid on the surface, and the whole placed in fine state for further operations for about 1*l.* per English acre. Lime can be burned on every farm at from 5*d.* to 6*d.* a barrel of three imperial bushels. The rapidity with which the land on this limestone subsoil recovers itself, and without any seeds being sown, reverts to good pasture, is very remarkable." The subsoil of some of the Turloughs is shell marl several feet thick.

Lord Lucan has been so harshly spoken of on account of the clearances which he made of cottiers and other human live stock from his estate around Ballinrobe, that it is but justice to his lordship to state here what Mr. Caird has said of those evictions and their results. "Lord Lucan has been much blamed for dispossessing the people who formerly held the land. It is not for me to discuss that question; but when the amount of employment he is now giving, and the superior style of husbandry practised on his farms are taken into account, it may be doubted whether the former possessors could earn as much by the miserable cultivation of their own lands as they now do in the capacity of hired labourers. There can be no doubt of the vast increase of the total annual produce under the present system, and the gain to the entire community must be the greater by the amount of that increase. Lord Lucan is probably the most extensive tillage farmer in Great Britain. He has at present upwards of 10,000 acres under his personal superintendence, having farm stewards on the different farms, who all take their instructions from himself. He has this year upwards of 1000 acres of white crop, and between 400 and 500 acres of green crop. He has a stock of 800 cattle, 60 of which are working bullocks, and 600 sheep; he has 40 horses, and gives employment on his farms to 600 men, including those who are making drains." After some other observations to the effect that Lord Lucan's system of management is admirable as to agency and superintendence in every department, from his lordship's practical knowledge of "his own business," which he has not disdained to learn fully, our author subjoins the remark that "it may not be possible, and probably would not be desirable, that many should imitate Lord Lucan in the extensive occupation and cultivation of their own lands. But it would be of vast importance to themselves, their tenantry, and their successors, if our great landlords on both sides of the channel were in some degree to emulate him in the personal study and attention which he devotes to the practical business of his estates."

It is well for the labouring poor that Lord Lucan is a cultivator of the soil, for if, like the leviathan grazing farmers of Meath, he discarded tillage, woe to the people. Happily he gives great employment. But, as a general principle, we deprecate monopolies in the present state of Ireland—very moderately sized farms are what are there wanted, with due reference to the capital likely to be brought into action (we hope by many of the native farmers themselves), and to the abundance of available labour. Lord Lucan, however, proposes to let some of his farms. Those of Cloonagashel and Gallowshill are thus described: "A considerable part of both these farms (within two miles of Ballinrobe) which are nearly 2000 acres in extent, is under tillage; nearly all of it is divided into regular enclosures, with excellent stone and lime walls. The soil consists partly of a fertile black mould, of great depth, on a limestone gravel, with some stronger land, and some lighter, but all admirably adapted for green crops and Grass, and, from the level nature of its ground, and its gentle slopes to the sun, well suited for tillage. There are two farmsteadings, lately constructed with threshing-machinery. Two or three farms, of from 700 to 1000 acres of land, could be got here—as good land as the average of East Lothian, at a rent of 18*s.* the imperial acre, and the poor-rate guaranteed not to exceed 1*s.* per 1*l.* The tenant must also pay the county cess; but Lord Lucan hands his farms over to his tenants with every permanent improvement executed, so that the farmer may have nothing to do but to stock and work his farm."

It appears, also, that capitalists who may desire to take large farms of comparatively wild land near the sea-coast, may have it on very cheap terms. That energetic improver and good landlord, Sir R. O'Donnell, who has had to contend with bogs, heaths, mountains, and the rude gales of the Atlantic (though his own residence, near Newport, is low and sheltered by woods and the curvature of Clew Bay), offers 5000 acres, within a mile of Newport, part of it on a lease of 200 years, the rest three lives, or 31 years, at an annual rent of 2*s.* 2*d.* per acre, besides the rates. The land is all situated at a low elevation, ranging from 30 to 60 or 80 feet above sea level; half of it is said to be capable of regular cultivation; the rest is fair pasture for Highland cattle, and very improvable. Sea-weed and coral-sand can be got for about 1*s.* a boat-load. Upwards of 100 acres of this tract have been drained and enclosed with substantial stone fences; and a commodious barn and other houses have been erected. "Flax is cultivated on it with success; and I was assured, to my surprise, by a farmer of Sir Richard O'Donnell's, that the Oats here produced sometimes weighed as much as 46 lbs. a bushel. The same proprietor has plenty of other land to let; that which lies along the sea-coast appeared to be of good quality; and from the peculiar conformation of the coast, it did not seem to suffer from exposure to the Atlantic. On many parts of the sheltered sides of these bays and islands, wood grows to the water's edge; and under careful management they are capable of being made most picturesque. The climate is mild, and the soil very suitable for green crop husbandry."

The Marquess of Sligo, whose well-timbered and picturesque demesne is at Westport, which is also on Clew Bay, is anxious to let lands to tenants of capital and enterprise, and would "even sell a portion on any part of his estate if he could thereby induce the purchaser to reside in the country, and assist in its improvement." He offers one hill farm of 5000 acres for 120*l.* a year, and would give "a lease in perpetuity of the land on which the tenant built his house."

This brings us, in conclusion, to ask onrselves the very natural question why, with *so many* favourable locations (amidst much cheerless, elevated, barren, and very bleak land—yet never severe compared with hill farms in the north of Scotland), landlords have not yet succeeded in inducing British farmers to transfer their skill and enterprise there? One satisfactory reply is to be found in the fact, that generally the new-comer would have to build his own farmstead. This is a very serious disadvantage—so opposed to British practice. One case is related by Mr. Caird of a Lancashire farmer, who with his brothers expended capital, unprofitably it is feared, in the erection of expensive farm buildings, in a tract where the soil and climate forbid cultivation. "If the same energy and capital had been employed on some of the fine arable lands of Mayo or Galway, how different the result would have been! Strangers should not too rashly expend their capital in the vain hope that they can at once import the agricultural management of an English county into a region where the soil and climate are totally unsuited for such a change. But neither must any general conclusion be drawn from the result of such an experiment adverse to investments judiciously made in the more favoured districts of the west of Ireland." The pressure of the land rates has, no doubt, operated greatly against tenancy in Connaught, but by fixing a maximum as to their amount, the difficulty is removable.

The idea of agrarian outrages is, after all, one of the most serious obstacles in the way of a stranger meditating the occupation of land there; but though this is as yet a sufficient motive for discouraging Englishmen or any strangers from taking land in Tipperary—that plague-spot of the island—no such obstacle in reality exists, or has existed, in Connaught. The farms recommended are chiefly held by the landlords themselves, or by non-resident graziers, and the people are *peaceable*, and intelligent, and willing to work if properly looked after. "There is (we unwillingly conclude our remarks of this excellent publication) room in this country for hundreds of farmers of skill and capital to whom Nature affords a fair prospect of success. But they must select their locations with care and skill, having regard to both soil and climate; and let them not rashly expend the capital which they will require for cultivation in erecting farm buildings, which are solely the landlord's business; and let them come to a precise and definite understanding with their landlords as to a limitation of rates and taxes, until some provision shall be made by law for protecting those who expend their skill and capital in improving and cultivating the soil from excessive rates, and, above all, from an increase of rates, through the higher valuation consequent on their improvements." Appended to the volume is a plan and specification of farm buildings (not including a dwelling-house), capable of accommodating 10 horses and 80 head of cattle in stables, with all other necessary offices suitable to a farm from 200 to 400 acres, according to the mode of farming, and at the moderate estimate of from about 500*l.* to 600*l.*, according as stone-slates or pan-tiles may be employed for the roofing. *H.*

ON STORING TURNIPS.

Fully agreeing with you on the importance of paying a little more attention than is commonly done to the storing of Turnips, not only as it concerns the well-doing of the cattle by whom they are to be consumed, as also the preservation of the bulbs themselves in severe frost, allow me to pursue the subject a little further, by offering the following observations.

The laying up a stock of topped and tailed Turnips (Apples, they are termed in Norfolk) is all very well, as far as it goes, provided they are got up dry and clean, are carted in fine weather, before they are touched by frost, however slight; and, above all, are well protected during very severe weather, in the shed, or wherever they may be laid for use. I speak experimentally on this point, having noticed great injury to have arisen in certain cases from insufficient security in this respect, all the more mortifying from the roots being of first-rate quality, and carted in excellent condition. A mere wooden shed, anything but weather-tight perhaps, and a slight covering of straw or stubble, are insufficient to repel a long and sharp frost, and many a load of Turnips have I seen, if given to the cattle at all, so frozen as to render breaking necessary, or, which perhaps is the safest plan, thrown aside to rot when a thaw comes on, and ultimately consigned to the dungheap.

This plan, I repeat, is all very well for immediate use; but to preserve a crop of Turnips throughout the winter, and for early spring consumption, something beyond this is necessary. And here the question divides itself into two separate and distinct branches, according to the sort of Turnip intended to be preserved; what serves very well for Swedes not being suitable for white Turnips, and *vice versa*. My present object therefore will be to describe the plan I have myself adopted in each of these cases, and which I can attest as completely efficacious—and, first, of Swedes. Various plans have been and still are in operation; the main object being, as it appears to me, the safety of the soil rather than the crop, by preventing the exhaustion which must follow a return to mild weather after the suspension of vegetation by frost, especially in a plant so fibrous as the Swede generally is. To this end, with the majority of farmers, the one thing needful appears to be to pull the crop after the bulbs have attained their full size and goodness, and either throw them into heaps, or oftener still, to scatter them about just as they are drawn, with their tops and roots upon them; in both cases without any sort of covering against frost. In fact, judging from such wholesale exposure of a crop, the labour and expense, it would almost appear that covering of any kind was thought entirely useless. No doubt the Swede is a peculiarly hardy variety of Turnip, but it will be difficult to persuade me that it does not suffer materially from the action of the frost. I would

therefore, having obtained a good crop, omit no effort to secure that crop. The best method of doing this, is undoubtedly that recommended by my friend Mr. Blackie, then Steward to the Earl of Chesterfield, and afterwards to Mr. Coke, of Holkham—I will give his own words :

"We consider the early sown Swedes to be full grown by the middle of November, and in some seasons rather earlier ; we then take the first favourable opportunity of the land being in a proper state for our operations, when all spare hands (men, women, and children) are set to work ; the Turnips are pulled up, and the roots cut from the bulbs, the tops being left on : old gorse or bill hooks, broken sickles or reap hooks, and such like implements, answer for the purpose. The Turnips are thrown into carts and conveyed to an orchard, or some other piece of old turf land most convenient to where they are intended to be consumed ; they are there shot out of the carts in heaps, and afterwards *placed*, as we term it ; that is, the bulbs are placed close to, and touching each other, with the tops uppermost, and only one Turnip deep. [An acre of good Turnips from the field occupies a much less space when placed than can reasonably be imagined by those who have not tried the experiment.] In this manner we endeavour to secure one or two months' supply for the stock intended to be fed with them, and find them keep good the whole winter ; if the weather prove very severe, a slight covering of litter is thrown over them. The depôts are kept so far sacred as to be only resorted to in cases of emergency, such as when the land is too wet to be carted upon without doing injury, in time of severe frost, deep snow, &c., while, at every favourable opportunity, we keep adding to the store in the preserve. As soon as the Turnips are removed from the field the ploughs are set to work, and the land drawn into such sized ridges as are thought proper. By this means the strong soils become pulverised, and the spring work expedited, as the ground only requires to be scarified and harrowed to make it in a proper state to receive the succeeding corn crop, which is always drilled in."

I have little to add to the above details, except to confirm, by my own experience, their perfect accuracy. The quality of the roots, as Mr. Blackie says, remains uninjured throughout the severest frost, and what is remarkable, the bulbs will continue to throw out fibres so long as they are suffered to remain on the turf where they were placed. I hardly need add, that the sward, though checked if the Turnips are kept thereon late in the spring, is ultimately much benefited by the soil and manure brought to it by such a mass of fibrous-rooted plants. I have now to describe a process, that of ploughing in, by which, at a trifling cost, the safety even of the largest and finest white Turnips may be effectually insured. I do not claim the merit of the invention. It was rather a favourite practice with my father, on such of his land as was dry enough for the purpose ; but I remember as a lad taking great interest in the proceeding, and manually assisting thereat, surveying the crop at the winter's end with no small pride, and boasting, as lads will sometimes do, that "I had a finger in that pie!" But to my description of the plan, as afterwards pursued by me on the farm I then occupied at Ditchingham, in Norfolk. The winter of 1813-14 will long be remembered as one of the severest on record. I happened that year to have a field of 20 acres (light land) with white Globe Turnips, the finest crop, my neighbours were pleased to say, they had ever known the land to produce. I also happened at that particular juncture to be sorely annoyed by game, not my own, as you may suppose, especially in the vicinity of this identical field of Turnips ; insomuch that a friend who came to see me one evening in that winter exclaimed, on going away (it was a bright moonlight night, and the ground was covered with snow), "I have seen what I never saw before, till now, 20 acres of hares!" But I am forestalling the story of my crop. Early in December, I could not help regarding it with some anxiety ; for, come what come would, there was the game, which, unless circumvented, was sure to make great havoc amongst it. It was, therefore, rather as a measure of self defence against hares, wood-pigeons, and other marauders, than from any foresight of my own as to the severity of the coming season, that I was led to perpetuate the ploughing-in system. The process was as follows : the land had been ploughed on 12-furrow ridges, on which the Turnips had been drilled at 18-inch intervals, or, as we called it, flat work, in opposition to the Northumberland, or raised work. The requisite amount of help having been procured, advantage was taken of comparatively mild and dry weather to commence operations. The Turnips were pulled up on each side the furrows, and thrown on the tops or middle of the ridges ; so as to allow a space wide enough to admit a plough, and pair of horses abreast ; a bout of the plough, as deep as it could be fairly set, was the next process, leaving of course two open furrows instead of the original one. In these two furrows, the drawers forthwith proceeded to place the Turnips, packed closely together with their roots and tops on. When the rows were completed, the furrows appeared chock full from end to end ; the plough was then so adjusted as to allow both horses to walk on the land, in order to avoid touching the Turnips in each furrow—a bruise from the hoof being as bad as the bite of a hare. Another deep bout of the plough whelmed the soil over the buried Turnips, leaving only the tops visible as they stood back to back in the furrows. In these newly formed furrows were placed such Turnips as the first two were unable to hold ; and another bout of the plough completed the work of burying the entire crop ; for, be it observed, the produce of a twelve-furrow ridge, may, unless of extra sized bulbs, be always packed into two such rows as I have described. A man had better follow with a rake to level the mould in the rougher places, so as to leave no part of the bulbs exposed to the weather, or the game. The crop being thus under cover, as it were, there is nothing to prevent the whole of the space lately occupied by the Turnips, from being ploughed, and exposed to the action of frost and snow, but I did not stand to do this ; first, because the lightness of the soil did not render it essential ; secondly, because the unploughed space would, I thought, be more convenient for carting off the crop ; but chiefly and lastly, because the setting in of the frost effectually put a stop to all attempts at ploughing for upwards of 10 weeks from that time. As it was, about an acre of the field I was unable to finish, was totally destroyed—I could not save a single Turnip from off it. Now mark the result of this experiment! With the exception of the tops, I saved all my Turnips ; and, wonderful to say, with quality almost unaltered to the last!

I remember an old neighbour dropping in to see some beasts of mine, then (in the middle of March) feeding in one of my yards. The first thing that struck him was the size and soundness of the white Turnips on which these beasts were then feeding—I was pointing them out as a superior stock—"Stock!" he said ; "but how on earth do you manage to have them of this quality, thus late in the season, and after such a winter as we have had? Why they absolutely rive when you stick a fork into them." And so they did sure enough ; and were as juicy as the day they were first pulled and placed in the furrows! Observe, I do not recommend this plan for any but light, clean lands—they might and undoubtedly would, be preserved on strong clays, but think of the mess the roots would be in when taken from the furrows, and the difficulty and waste attending the getting them clean enough for the cattle bins! No—plough in on light land, and all will be right. If severe frost, the Turnips will be saved—in a mild, forward winter, the land will be saved. *Samuel Taylor, Barnwood, Gloucester, Feb.* 13.

P.S. It may excite surprise that so slight a covering of earth as I have mentioned should suffice for the preservation of so large a root as the white Turnip, when a thick coating of straw or stubble has proved insufficient for the purpose. In practice however, the fact is so ; and for myself, I would sooner depend on 6 inches of mould, than 6 feet of straw as a repellant of frost.

INSTANCES OF CATTLE FEEDING.—No II.

1. Lot 1st, 13 three-year-old heifers, mixed breed. Lot 2d, 7 three-year-old bullocks, mixed breed. Lot 3d, 9 three-year-old heifers, Hereford breed.

2. Lot 1st, soiled in yards during summer ; put up to fatten 6th October. Lot 2d, ditto, ditto. Lot 3d, Put into open yards as soon as bought.

3. Lot 1st, tied up in stalls 10½ ft. long by 4½ ft. wide. Lot 2d, ditto. Lot 3d, in open yard, with shed to lie under.

4. Lot 1st, each beast consumes daily 70 lbs. raw Swedes, 2½ lbs. Linseed-meal soaked in cold water, 2 lbs. Barley-meal, and 8 lbs. straw chaff. Lot 2d, each beast consumes daily 90 lbs. raw Swedes, 2½ lbs. Linseed-meal soaked as above, 2 lbs. Barley-meal, and 8 lbs. straw chaff. Lot 3, put in the yard to freshen up for stalls, receiving a small quantity of Turnips, with as much straw as they can consume, but no account taken of the quantity.

5. Little Wheaten straw, no account taken of the quantity.

6. Lot 1st, estimated increase in weight by Christmas, 10 imperial stones ; the value depends on the market-price when sold. Lot 2d, increase in size more than the first, but not so forward. Lot 3d, going on very well.

7. As clean as hunters ; very comfortable.

N.B. There are no cattle bred on this farm ; they are all bought regardless of breed, endeavouring to buy what will pay best. *James Laidlaw, Town-field Farm, Frampton-on-Severn, Gloucestershire.*

ON HIGH FARMING : AUCHNESS.

It is often alleged that farmers, as a class, are slow to follow out any improvements which may be brought before them. Now, without denying that this holds good in some instances, we are of opinion that a large number of them at the present day are quite willing to turn their pound into a guinea did they know how to do it ; but unluckily many schemes, many improvements, turn out mere alterations, and often they are disappointed of being benefited, while sometimes heavy losses arise from changes. Amongst many remedies for the present low prices none is in more general repute than high farming, which, when taken in the Auchnessian sense, means large outlays and large profits ; and I have never yet, notwithstanding the outlay, met with a farmer who was not most anxious to be able to convert his farm into such another California, only the uncertainty of the result deters many from attempting it, and with many others whom I could name, equal and larger outlays have been incurred, as skilfully perhaps, but with far less real success than what is apparent there. How comes it, then, that men have for years past been laying out the pound per acre on manure, and a similar sum on Linseed-cake, selling nothing but a few acres of Potatoes and the grain raised, turning all the Turnips into beef and mutton for sale, making all the straw into manure, and consuming with sheep the Grass on their fields, carting out the urine for top-dressing or on to the dunghills, purchasing the live stock with skill, feeding them with food increasing in richness as they advanced to maturity, and watching the favourable time to dispose of them ; besides bestowing a constant personal attendance on all the operations of ploughing, sowing, cleaning, reaping, threshing, and marketing the produce ; without obtaining results at all approaching to the profits at Auchness, or more than even a bare livelihood. We know several farmers who profess themselves perfectly willing to incur the same outlay for manure, labour, &c., as that incurred at Auchness, had they the probability of attaining half the profits there shown. We know one who is both able and willing to double the sum expended there for purchased food, bones, guano, &c., on his own farm, should there be another farmer or factor who can show from dry-field soil a return similar to that at Auchness. Many people say that as "one swallow does not make summer," there is little inducement to attempt such results. Now, as from my earliest acquaintance with land, I have lived among those not only speaking of liberal outlay on land, but following it out in practice by purchasing largely of manure, seldom giving their green crop less than 30 tons per acre, costing at least 6*s.* per ton, besides reckoning that every ton above that quantity paid them double to one below it, I begin to suspect that the system followed may be amended ; but of this we are sure, that it cannot be by the Potato, for previous to the "taint," with some 40 tons manure per acre, we tried to make our fortunes from it ; and although large crops were raised, yet the price became so miserably low that we found it prudent to consume a goodly number of them with cattle, in place of sending them to market, and the sums obtained did not often cover the outlay for manure.

Perhaps some of your kind contributors, Mr. Hewitt Davis say, who seems to have discovered a plan by which grain crops can be much more cheaply raised than through the intervention of green crops and Grass, may throw some light on our difficulties ; but I would just here hint also that it cannot be by increasing the amount of land under Wheat, as our climate does not permit its increase, neither would the soil, although dunged with 40 tons per acre every four years, enable us to have it oftener than once in that period. We are exceedingly desirous to be enlightened, and welcomed Mr. Caird's pamphlet when it appeared as a most hopeful production, and have also perused his new one with increasing interest, although we could have wished that he had obtained from Mr. M'Culloch his balance sheet for the years 1847 and 1848, instead of the yet to be realised returns for 1849, as our expense in farm profits is such that it is far pleasanter calculating what they ought to be than to look at the sum total actually realised. A friend of ours, so deeply taken with high farming, having a very fine crop of Turnips on some 60 acres of land, determined, in September last, at once to increase his outlay in that direction, and in place of purchasing the usual number of cattle he bought one-third more, but determined also that he would buy an additional quantity of Linseed cake, corn stuffs, &c., to be able to carry them all on to the usual period of selling them. He has now sold one-half of them, of as fine quality as could be wished, but the price of the best beef being now ½*d.* per pound less than what he paid for the half fat animals, he finds that high farming gives him low profit, and were he to sell all his cattle at the present time, he would just be minus any return for his fine crop of roots ; whereas his next neighbour who followed in the good old fashion, not much in vogue hereabouts now-a-days, of buying no more stock than the Turnips grown on the farm would feed, finds that from the cattle he has already sold, and those he still has to dispose of, he will have a return of 6*l.* per acre.

These are somewhat staggering facts, but they cannot be disputed ; the truth seems to be, that such attempts at high farming in the face of falling markets ought to be eschewed. What should we think of a merchant, aware that the articles in which he dealt were becoming of less value, yet bent on increasing his stock of them, or of the manufacturer employing the more people to make more goods to throw into an already overstocked market. It is not by such plans that the traders and manufacturers have made their fortunes. Just look what is the effect in regard to guano—the price of that article in December, 1848, was less than what it is now, and yet grain and anything that the farmer has to sell is nearly one-third lower. We are great admirers of cleverness, but somehow we do not reckon it any great mark of ability to recommend a plan by which our pound is changed into 15 shillings. I trust that some of your high profit finders may enlighten us as to such weighty matters. *Mic. M'Muck.*

Home Correspondence.

Influence of Light on plants, showing the necessity for early sowing of spring corn.—The influence of light on vegetation, and the mischief to young plants from too great exposure to its stimulating powers in their infant growth, is very clearly and beautifully presented to our observation, in the growth of Hyacinths, as seen in glasses, under different circumstances. Gardeners have found that to get strong self supporting stems, and fine healthy flowers, it is necessary when the bulbs are first brought in contact with water, that they should be placed in the dark for 3 or 4 weeks. Whilst treated

in this way, they make little shoot upwards—they are engaged in pushing strong roots down into the water. But great is the difference in those that are too early brought into the light; their progress upwards is much more rapid, but their stems will be weak, and their flowers ill developed, and tumbling about, from the inability of the drawn-out stalks to uphold them, and the whole plant shows the ill consequences of too excited a vegetation, and the want of support at the roots. In farming I have had frequently to remark the same difference of growth, and the same debility of stem in the late sown corn, as compared with the earlier. The cuckoo sown Barley, deposited when the duration of daylight much exceeds the night, is known by its weak straw, and liability to be laid, and the inferiority of its grain. Late sown Oats are comparatively but as tailings to ealier sown, and Beans and Peas are still greater sufferers from too late sowing. In a word, the growth above ground of late sown corn, from the longer exposure to the stimulating effects of daylight, is too much for the lesser growth of the roots underneath. Farmers often suppose, because there is comparatively little difference in the time of appearance above ground, between January and April sowings, and the two harvest nearly together, that there must be but little progress making in the seed during the period it is not visible. But this is not so, as any one may see, by taking up seed sown in the depth of winter, a month or so after it has been deposited. I believe the earth in England is never so cold as to wholly prevent roots from making some progress. For I have noticed grain that has been sown immediately preceding a long and hard frost, on the frost breaking, to have put forth its radicles whilst it was bound up in ice; and so it is with trees, and hence the necessity for autumn transplanting of many shrubs which will not bear late moving. Now if roots were idle in the winter, where would be the difference in transplanting between October and February. To the advantage from winter sowing of Barley, now so much practised in Essex, Suffolk, and the eastern counties, I have before referred. On this subject the farmers of the south and west of England, have much yet to learn. They frequently lose quarters an acre in their returns from not sowing sufficiently early. *Hewitt Davis, 3, Frederick's-place, Old Jewry, London, February 16.*

Grasses.—I have for some years studied with interest the Grasses growing in our pastures. It appears to me that proprietors, farmers, and land-agents, are little aware of the extent and importance of this subject. If land cannot be ploughed to profit in these times of transition, it should bear something, and what better than a productive sward? Now it is grievous to see the common way of laying land down to pasture, by sowing Rye-grass and white or red Clover. The farmer is unaware of the gregarious nature of Grasses. They will thrive only in societies. Sow any one, two, or even three sorts only, and they do not last long. They make room for more company and the natural weeds of the soil. Agrostis alba and rubra, Triticum repens or other worthless Couch-grasses, spring up and choke their more profitable neighbours. It is true these also give way in their turn, and a sward of mixed pasture Grasses is slowly formed. The seeds of these are brought in the dung from the yards where hay is fodder ed, on the droppings of cattle fed on other pastures, or spring from that wonderful stock which for ages has accumulated in the soil. Thus in many years a pasture is formed; it might have been gained in one by sowing at first a good selection of Grass seeds. Some Grasses grow in spring and again in autumn, others in the spring or autumn only, a few throughout the warmer months. They differ much in their qualities as food. Some are tonic or aromatic, some are mucilaginous, some are rich in starch or sugar, others combine these qualities in various degrees, or are deficient of valuable ones. The law of their growth in mixed societies, and at different seasons, makes our pastures always green; the variety of their qualities renders them grateful and wholesome. Is there not a beneficent provision, adapting the qualities of the Grasses to the periods of their growth? Is not, for example, the aromatic quality of the vernal Grass adapted to correct the too succulent condition of the herbage in spring and autumn, at both which seasons it grows vigorously? *H. R. Smithe, Eastling, Kent.*

Mr. Mechi and Mr. Huxtable.—No doubt others as well as myself are pleased to read any remarks from Mr. Mechi in the *Agricultural Gazette*; they are always fresh and off-hand. He and Mr. Huxtable (both of them too sensible I should hope to be vain), may be assured their opinions and practices attract much attention at present. The notion of the latter as to four sacks of Wheat being the natural production of land, cannot be maintained for a moment. A neighbour of mine, after a good crop of Turnips, regularly fed off, had but five sacks last harvest. Mr. Mechi suggests whether the Vetch does not "evaporate amazingly?" I fancy it does, from the following case, I will not call it experiment, as I had no object in view. Last autumn I planted three Vetches in a flower pot on a shelf in my dressing room; they have thriven in great luxuriance all the winter, but soon droop without a good supply of water. The plants are beautifully green, and hang down about 2 feet, delighting the eye by their verdure, and affording an anticipated pleasure of what my six acres will be by and bye. The precariousness of a pulse crop is proverbial; a farmer once told me he winnowed 10 sacks of Peas from one acre. The next year he hoped to make a fortune by sowing 10 acres, which yielded only one sack. Some years since I mixed one sack of partridge Peas with eight of Oats, and at harvest ruddered out 10 sacks of clean Peas, leaving more than sufficient in the Oats. Last year was also very favourable for pulse; I never expect to reap so large a crop. I bought 3 bushels of Early Royal Vetch, and added 1 bushel of winter Oats. Sowed the 4 bushels on two acres of ground; a fourth part was cut up for cattle, from the remainder I winnowed up 20 sacks and 1 bushel, 14 sacks to the acre; and this is not the very best course of husbandry, as I had taken two successive crops of Wheat from the same field, a load to the acre the first year, of Spalding's Prolific, manured for; 8 sacks 1 bushel the second year of White Navarre, by way of change; and now I propose sowing Barley—something very like four consecutive white crops, as the Oats were very stout. Were a tenant of mine to farm after this fashion, I should certainly remonstrate with him as contrary to the custom of the country, but should he in reply say he knew a very clever, intelligent, and scientific person who adopted that plan with great success, what could I say? *Quis.*

Acid Beer.—The only remedy I can recommend is to start with good materials, and let these be given into the hands only of a good brewer; no quantity of hops or malt will preserve beer without this aid. I have only been accustomed to brew twice a year, unless our table-beer required a fresh supply, which might occur both in winter and summer. April and the end of October or beginning of November, are the seasons for this vintage, when the barrels are all filled—some to stand for years, others for successive and immediate draught. I never knew well brewed ale or beer affected even by lightning. I have known them sensibly affected by hot weather adding to the consumption of them. When I was last in my late grandfather's cellar (he has been dead 50 years) there was fine old bottled ale, upon which old Bacchus would not have been satisfied merely to smile; this was of the startling strength of four gallons from the bushel of malt. October was the favourite month in those days. The danger of brewing in warm weather, and in summer, is, that when proper means are not adopted to cool the wort rapidly, by dividing it in small quantities in shallow coolers, it is liable to become what I have heard people denominate "summered," that is, it obtains a peculiar acidity which no alkali will overcome. If "Cerevisium" can be prevailed on to believe that the cause of the acidity of his beer lies with his artist, I could entertain a hope of securing him a good brewing in future. For 40 years the plan I adopt was practised in one family, without a failure; by them it was given to a reverend gentleman, who gave it me, after a full trial of it; and during 30 years I have tested its efficacy. Perhaps 'Cerevisium" may be surprised to hear that some families do not use any fermenting ingredient in their ale and beer; I do, but the quantity is so small that unless I superintend the working of it myself, till my brewer sees the power of a small portion of yeast, and the excellence of the vintage, I could not get it properly done. My ale is glass bright in a fortnight, if wanted so soon, and keeps well. The only fining admitted into my barrels, is fine wheaten flour—not sand, an article of too much gravity to admit other floating particles to accompany it in its precipitate precipitation. I should be glad to undertake the office of brewer in a nobleman's family, and if at liberty to engage my own subs, should fear no disappointments but the too quick emptying of the hogsheads. Cleanliness, quick cooling, quick fermentation perfectly carried on, quickly stopped, dry barrels, good cocks, sweet bungs, well secured to prevent the admission of air, will be found efficient aids in a good cellar, to prevent spoliation by lightning. There is more "barley bree" spoiled by excessive fermentation than belongs to the agency of electricity. I was at the house of a friend who had engaged a noted brewer, to fill his cellar; one half hogshead he was to brew thin; to ferment this we saw him take 6 quarts of yeast on the evening of the day after he had brewed. I made my observation to the host, who declared his ignorance of such matters, but we went to the cellar—the fermentation had not ceased at eight days from the brewing. It was his only performance, for the product of 5 bushels of malt, and 4 lbs. of hops, was muddy vinegar (alegar). ♁

Cultivation of Flax in Ireland.—At this moment, when a growing appreciation is experienced in foreign countries for our yarns and linens, and just before the Flax-growing season, the following particulars cannot fail to be interesting: At the monthly meeting of the Royal Flax Improvement Society, a gentleman present remarked, that he had sold his crops of Flax straw, grown near Carrickfergus, pulled and dried, to a steeping company at Cregagh, getting 12*l.* per Irish acre for it, which paid him better than any of his other crops. He had since been told by the purchasers, that they were offered 8*l.* for the seed of an acre of this Flax; and he had himself seen some of the fibre, which they had steeped and scutched, and which was of such good quality as to be valued by the spinners at 63*s.* per cwt. It was producing from the straw at the rate of about 80 stones of 16 lbs. to the acre, which would be 28*l.* worth of fibre, and, adding 8*l.* for the seed, the Irish acre would bring 36*l.* *T. S.*

Allotment System.—Having read several articles in your valuable publication (which I take in), on the subject of labourers' cottages and allotments of land, and having had many years of practical experience on these matters, and being deeply impressed with the extensive good that might be done for this class of the community, and without loss to the landed proprietor or the tenant farmer, but much to their interest every way, I trouble you with a few lines on the subject. I intend only to state "facts and practical results" which have passed under my own eye and management. I have ever found that a bit of land, attached to a comfortable dry and warm cottage, tends more than anything else to and raise the moral character of the family of the agricultural labourer, even if steeped in poverty, sickness, and distress. This certainly is worth an effort to accomplish, and I have found it far better to put a poor man in the way of earning a shilling than giving him one; it is more prized and valued, and not likely to be spent in drink, which is too often the fate of a given shilling. I will now just give you the result of an experiment I tried with a man about 45 years of age, of most depraved habits, so much so that he was shunned by every one, and was considered incorrigible. I undertook the task of endeavouring to save this poor fellow from ruin. Accordingly, meeting him one day, I said, "Well, Giles; will you take an acre of land?" He replied, "I don't know much about it. I should not like to lose anything by it." I replied, "Well, take the ground, and if there is any loss I'll bear it, and if there is any profit you shall have it." It was thus arranged, and, without a shilling, the man commenced his acre; his outgoing expenses being entirely lent him by a friend, according to the subjoined schedule:

1 acre of land, free from tax and tithe	£2	0	0
Advanced for seed Oats, for half an acre	0	12	0
" for Potato plants, ditto	0	17	3
" for purchase of a pig	0	13	0
" for ploughing half an acre for Oats, and bouting up half ditto for Potatoes	0	8	6
" for manure for Potatoes	2	8	0
" for cartage	0	18	6
" for mowing half an acre of Oats	0	1	3
" for threshing ditto	0	3	6
	£8	2	0

He repaid the whole of these advances in the following manner:

Two quarters of Oats	£2	4	0
105 bushels of Potatoes	5	5	0
Cash	0	13	0
	£8	2	0

All this was done without a single day's work by the man, as he was otherwise employed; his wife and children planted the Potatoes and dug them up. In answer to my inquiries as to his profits, his answer was, "I have 90 bushels of Potatoes on hand, and upwards of a quarter, that is 8 bushels, of head Oats, and a 35 stone hog in my sty—a thing I never had in my life before. I have Potatoes enough for my family for winter, and for seed next year." I observed that he had laid out a great deal for manure, and advised if a cesspool, &c., wanted emptying in the town, to offer to do it for the soil. He did so, and his children collected dung on the roads; and the next year, instead of buying dressing, he sold three loads to his neighbours, and reduced his expenses from 8*l.* 2*s.* to 4*l.* 13*s.*, and he does not owe his friend a shilling. This is now some years since, when I resided in the country. The man became an altered character, much to the comfort of his family, and also his employers. I can give you many other instances, with Dr. and Cr. accounts, of the great blessing of a bit of land to the labourer, if you think it likely to be interesting or encouraging to your readers. *Y. Z.* [We have no doubt they would.]

Ireland.—Although to rivet the attention of the public requires novelty, yet a constant recurrence to a subject which is progressing in favour with a few energetic spirits must eventually benefit society, by convincing the most desponding that truth will prevail, and produce fruit both pleasing to the eyes and valuable to the touch. The advance is slow but sure in agricultural pursuits, when carried out with prudence. Nevertheless, the disadvantage of refusing time to mature the results of rural speculations is apt to dishearten the farmer, impatient of delay, when he sees the manufacturer can turn his capital over two or three times in the year. I am again induced to trouble you with a few remarks, in consequence of reading the cheering accounts contained in a late *Gazette*, which told us of the settlement of two farmers in Ireland, whose prospects appeared to be most satisfactory, proving that hard working intelligent men with small capitals may, in that country, obtain a respectable and comfortable home. If a farmer can make up his mind to face boldly the annoyances of the first six months' residence in Ireland he will do well. There is no doubt he will meet with many things to try his equanimity during that period, but probably not more than in his own district, under the violent agitation and discontent occasioned by the useless attempt to revive protection. Should this letter meet the eye of any agriculturist who has lately established himself on the other side of the Channel, let me beg of him to publish in the *Gazette* a statement of his success or otherwise; a true account from the fountain head will be worth a dozen communications from anonymous correspondents, however persuasive and well meant. A few advertisements from known Irish landlords, offering farmers of the United Kingdom, who can command character and cash, land at a reasonable free-trade price, would be the means of facilitating the emigration to their estates of enterprising yeomen, whose example would soon be followed by dozens, who cannot decide for themselves, but would soon tread on the heels of their neighbours when once established. The sooner a thorough understanding is promulgated on this point the better, for it is quite certain an infusion of English and Scotch industry is the principal remedy to restore Ireland to its proper position, as one of the most

productive and salubrious islands in the world. Let us hope that the chance of procuring a sterling class of agriculturists will not be thrown away by any delay on the part of the powerful and influential landlords. Hundreds are ready and anxious to emigrate to distant lands, where peace and plenty, as in Ireland, will reward the active and honest farmer. Are some of our best men to be kept in ignorance of the blessings within their reach, and driven to seek subsistence in the colonies, when there are thousands of acres ready to bear abundant crops at the command of sturdy sinews and bold hearts? The motto England appears to have appropriated to herself is certainly not a wise one, but from the events of past years it is to be feared she has been infatuated, "Acting in haste, and having to repent at leisure;" her children are determined to follow her bad example. The landed interest must be satisfied for some years with a moderate per centage on money; the old calculation of these rents must be forgotten, or only considered as a pleasant dream, till land is worked up to its full bearing, when there is no saying what may be produced. *Falcon.*

Digging v. *Subsoiling.*—In the *Agricultural Gazette* of the 23d ult., page 124, your correspondent "Verax" says by way of explanation, "the principal intention of my former communication was to show what can be done by good cultivation, in contrast to the generally adopted mode of the country." With so laudable a motive it is a great pity that he did not take the trouble to inform himself a little better before broaching his theories in the columns of the *Agricultural Gazette.* Had he taken the precaution in his contrast of adopting statute measure instead of customary (an error very common, and which I consider cannot be too much deprecated), he might have saved himself from the odium which justly attaches to such want of common prudence, and have prevented the liability of misleading the credulous and uninitiated. By consulting the best dictionaries extant, "Verax" will find that (in addition to its being the recognised statute measure), it is by them laid down, that $16\frac{1}{2}$ feet, or $5\frac{1}{2}$ yards, multiplied by itself, is a rod of land, and the same authority will tell him that 40 of such rods is a rood or quarter of an acre of land. "Verax" wishes to know my estimate for subsoiling an acre by horse power, which I consider would amount to 1*l.* 13*s*, putting every item at full price, exclusive of wear and tear of harness and ploughs, and which I should consider but little inferior to the forking, with a balance in my favour of 1*l.* 12*s.* 4*d.*, as compared with the calculations of "Verax." *A Suffolk Farmer.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Monthly Council was held at the Society's House in Hanover-square, on Wednesday last, the 6th March. Present, his Grace the Duke of Richmond, K.G., trustee, in the chair; Lord Camoys, Sir T. Dyke Acland, Bart., M.P., Sir C. Lemon, Bart., M.P., Sir R. Price, Bart., M.P., Mr. R. Barker, Mr. C. Barnett, Mr. S. Bennett, Mr. Bosanquet, Mr. Bramston, M.P., Mr. Brandreth, Mr. F. Burke, Colonel Challoner, Mr. Garrett, Mr. B. Gibbs, Mr. Grantham, Mr. Hamond, Mr. F. Hobbs, Mr. Hudson, of Castleacre, Mr. Lawes, Mr. N. Malcolm, Mr. Miles, M.P., Mr. Milward, Mr. Pusey, M.P., Professor Sewell, Professor Simonds, Mr. Shaw of London, Mr. V. Shelley, Mr. Slaney, M.P., Mr. Stansfield, M.P., Mr. Turner of Barton, Mr. C. H. Turner, Professor Way, and Mr. J. Webb.

The following new members were elected:

Baxendale, Joseph, Woodside, Whetstone, Middlesex.
Gurney, Rev. Wm. Walter, Roborough, Torrington, Devon.
Bletchley, John, Buchover, Thornbury, Gloucester.
Heysett, L R., Boracott House, High Hampton, Crediton.
Edwards, Joseph, Hutton, Somersetshire.
Braddon, William, Blackland, Plympton St. Mary, Devon.
Wilson, Joshua, Islington, Middlesex.
Spragge, Francis, Torquay, Devonshire.
Tolcher, Edward, Ridgeway, Plympton, Devon.
Ormerod, Henry Mere, 85, Mosley-street, Manchester.
Brydges, Thomas, Marwood House, Barnstaple, Devon.

The names of 17 candidates for election at the next meeting were then read.

Finances.—Colonel Challoner, chairman of the Finance Committee, laid before the Council the monthly report on the accounts of the Society; from which it appeared, that on the last day of the month just ended, the current cash-balance in the hands of the bankers was 2634*l.* (including the subscription of 1260*l.* from Exeter). The chairman also reported the investment of 1247*l.* in the purchase of stock in the public funds, as ordered by the Council at their last monthly meeting; and laid on the table the bank receipt for such purchase.

Essays and Reports.—Mr. Pusey, M.P., Chairman of the Journal Committee, reported to the Council the receipt of 64 Essays and Report, in competition for the prizes of the Society in that department, for the current year. The Council referred these essays to the Journal Committee, with a request that they would take, as usual, the requisite steps for their examination by respective classes of Judges, and the adjudication of the prizes.

Country Meeting.—The Duke of Richmond, as Chairman of the Charter and Bye-law Committee, in reference to the Society's Country Meeting in 1851, laid before the Council the Report of that Committee, which was adopted by the Council. His Grace then favoured the Council with various suggestions, founded on an extensive enquiry he had made of the law-officers of the Crown, and other high legal authorities of the kingdom, connected with the measures it would be desirable for the Council to take, in consequence of the resolutions passed at their special meeting, on the 20th ult. The Council thanked the Duke of Richmond for the favour of these suggestions, which they ordered to be recorded in their minute-book for adoption when the proper time for their application should arrive.—Mr. Raymond Barker and Mr. Miles, M.P., renewed the notice they had given on the 20th ult., for a motion at the Monthly Council in April, to rescind the resolution of 3d May, 1847, and substitute an amended resolution in its place.—Mr. Grantham gave notice that at the proper time he should be prepared to submit to the Council a strong presumptive case in favour of Lewes as the place of one of the Country Meetings of the Society.

Chemical Lectures.—The Report of the Chemical Committee having been read, the Council accepted, with their best thanks, Prof. Way's offer to deliver a Lecture before the Members, in the Council-room of the Society, at 12 o'clock, on every third Wednesday of the month during the current session of the Society, namely, in the months of March, April, May, June, and July; the next lecture to be delivered on the 20th inst., "On the subject of a newly observed Property of Soils, affecting the use of Manures, Irrigation, &c."

Guano Adulteration.—The Council referred to the Chemical Committee the recommendation of the Weekly Council of the 13th ult., that Mr. Hunt's statement of the extensive adulteration of guano at present taking place in the neighbourhood of the Metropolis, should be taken into special consideration, with a view to the adoption, if possible, of a remedy for the evil.

Irrigation.—On the motion of Mr. Fisher Hobbs, seconded by Mr. Pusey, M.P., the Council resolved: "That an opportunity be taken, at the Exeter meeting of the Society in July next, to obtain information on the Theory and Practice of Irrigation and Catch-meadows; and that arrangements be made accordingly," referring to their General Exeter Committee the steps to be taken for effectively carrying out the details of the proposed measure. This subject led to an interesting discussion on the subject of irrigation, and to a communication of facts connected with the advantages derived from its application in localities where it had been adopted, and with the want of it experienced in those parts of the country into which it had not yet been extensively introduced.—Mr. Bennett gave a most favourable statement of the appearance of Grass crops in Cornwall and Devonshire during a recent journey he had made through those counties, and in envying their rich growth, he strongly felt the advantage to be derived by the transfer to his own county (that of Bedford) of a similar beneficial system of early, vigorous, and repeated growth of such crops.—Mr. Shelley had, last autumn, in Sussex, laid down 60 acres under irrigation, and the effect was most striking.—Mr. Slaney regretted that the system had not yet extended to Shropshire. An obstacle still existed to its adoption, arising from the refusal of intervening occupiers to join in carrying it out. This had long been provided for in Lombardy, and he hoped it would soon be so also in this country.—Mr. Turner, of Barton, gave an interesting statement of the nature of his own operations connected with irrigation in Devonshire and of its peculiar advantages.—Col. Challoner thought that as a new implement in the show-yard lost half its value when left unexplained by its inventor, so would these water-meadows in Devonshire, when seen by the members of the Society, unless the proprietor made arrangements for the details of their construction and operation being explained by their bailiffs, or other persons whom they would kindly direct to be in attendance.—Sir Thomas Acland and Mr. Turner expressed their entire willingness to afford every explanation in their power on this subject, and they each gave to the members of the Society a most hearty welcome to their respective establishments.—Mr. Pusey thought that the Society on this occasion might, with very great advantage, imitate the Archæological and British Associations, by paying personal visits in a body to the various objects of attraction to farmers in Devonshire, especially to an inspection of their system of irrigation.—Mr. Fisher Hobbs alluded to the excellent Paper on this subject, by Mr. Pusey himself, in the last Number of the Journal, which led strangers to the system to feel a strong desire to witness the reality. — Sir Thomas Acland could only express, on the part of the Devonshire farmers, his thanks to Mr. Pusey for that interesting statement, which brought into so prominent a notice this great feature of their agricultural operations.

Filling-in Drains. — The Council accepted, with their best thanks, the liberal offer of Mr. Slaney, M.P., to renew this year his prize of 10*l.* for the best Plough to fill-in the soil cast out of drains, with not more than four horses (two and two abreast); to be awarded at the Exeter meeting; referring the details and conditions of the prize to the Implement Committee.

Draining.—Mr. Bullock Webster addressed a letter to the Council, expressing his intention of justifying the statements he had made in his paper published in the Journal, and of correcting the misconceptions into which some parties had fallen who had called that paper in question.

South-Devon Cattle. — Mr. Phillips, of Broonborough, appeared before the Council, on the part of the Breeders of the South-Hams Cattle, and learned from the Council the conditions under which prizes for that class of stock could be offered at the Exeter meeting.

Miscellaneous.

—*Journal of the English Agricultural Society.*

Formula for making the boiled butter (beurre cuit) *of Vallais and Piedmont.*—"Into a clean copper pan (better, no doubt, tinned) put any quantity of butter, say from 20 to 40 pounds, and place it over a very gentle fire, so that it may melt slowly; and let the heat be so graduated, that the melted mass does not come to the boil in less than about two hours. During all this time the butter must be frequently stirred, say once in five or ten minutes, so that the whole mass may be thoroughly intermixed, and the top and bottom change places from time to time. When the melted mass boils, the fire is to be so regulated as to keep the butter at a gentle boil for about two hours more, the stirring being still continued, but not necessarily so frequently as before. The vessel is then to be removed from the fire, and set aside to cool and settle, still gradually; this process of cooling being supposed also to require about two hours. The melted mass is then, while still quite liquid, to be carefully poured into the crock or jar in which it is to be kept. In the process of cooling, there is deposited a whitish cheesy sediment proportioned to the quantity of butter, which is to be carefully prevented from intermixture with the preserved butter." *From a Physician's Holiday, by John Forbes,* M.D., F.R.S. 1849. Murray; page 494. In the next page he states that some add a little salt in the boiling.

Calendar of Operations.

MARCH.

Bedfordshire Farm, *March* 4.—The late favourable weather has allowed the various operations of the field to go on satisfactorily. The principal employment of the horses has been ploughing and preparing the land for Beans, Barley, Oats, &c. Bean and Pea planting and the sowing of spring Wheat is now generally concluded. Barley and Oat sowing has commenced. The horse labour on this farm will for some time prospectively be connected with the sowing of corn and seeds, harrowing Wheat, hoeing winter Beans, ploughing the Turnip fallows, &c., all of which operations can only be carried on perfectly during fine weather. Ploughing in wet weather or moving saturated land does harm generally, and instead of forwarding horse labour retards it in the end, and does injury to the succeeding crop. During wet weather our horses will be employed in carting dung and other manures, harrowing and rolling Grass land, and all such operations as can be done, to allow the horses, in full force, to get upon the land when fine. The following mixtures of Grass seeds have been found to answer very well on both light and heavy soils, sown with either Barley, Oats, or Wheat: 12 lbs. of Red Clover and 8 lbs. of Trefoil per acre for mowing or feeding off one year. For mowing or feeding for one, two, or more years: 8 lbs. of white Clover, 2 lbs. of Trefoil, 2 lbs. of Cow-grass, and 6 pecks of Perennial Rye-grass seed per acre. If early keep be required, Italian Rye-grass should be substituted for the Perennial. We have seen Italian Rye-grass, sown last April, already forward enough for feeding off with sheep. A top-dressing of from 50 to 80 bushels of wood or coal ashes does much good on seeds in all ordinary seasons. Soot and salt, applied as a top-dressing to green crops and corn, has a very fertilising effect, and is, we think, more certain in its result than guano or any of the very volatile "artificials," which lose so fast by exposure to drying winds or a warm temperature. About 30 bushels of soot and 5 of salt per acre is sufficient in most cases. The soot and salt should be well mixed and frequently turned for some weeks, or even months, before application. We transplanted Wheat last week to fill up some blanks caused by wireworm, &c. In former seasons the transplanted Wheat invariably succeeded, when seed in other instances failed, from the depredations of birds and other vermin. The young Wheats in this quarter are generally looking well; so are winter Beans and Tares. Turnips are likely to be scarce; but Mangold Wurzel growers have still a good stock of roots beside them. Potato planting has again commenced with almost undiminished ardour, although the speculation is most uncertain, to say the least of it. *R. V.*

Lammermuir Sheep Farm, *March* 1.—After six weeks' genuine winter weather, characterised by severe frosts, heavy falls of snow, hurricanes of wind, and a temperature varying daily, the thermometer at one time as low as 16°, and in the course of 48 hours up to 40°, we have had for the last fortnight what we would have been inclined to call "spring," had it not come on so suddenly, and so much earlier than we are accustomed to in these elevated parts. Still the change is most acceptable in the mean time—the snow is all gone, and the surface of the ground well dried, though it can scarcely be said that there is any spring on the Grass. There is one plant, however—Harestail-cotton-grass—which though delighting in a wet peaty soil on the bleakest parts of the hills, and to one ignorant of its value as a pasture Grass, of a very unpalatable appearance, is yet by far the earliest plant we have, and highly prized by the sheep during the spring months. This (provincially designated "Moss") is now nearly in perfection. The sheep are most of the day in search of it, and its nutritious qualities are abundantly evident in the improved condition of those on whose ground it grows profusely. A lot of ewes, intended for sale before lambing, are now receiving Turnips. They are netted on during one-half of the day, and then let off to a piece of heather. In the course of a few days the Cheviot shearling ewes will be put beside them; and afterwards, most of the older ewes of that breed will get a few daily for about three weeks before they begin to lamb. The black-faces, being much

hardier, will not get any; besides, we have found that a month or six weeks' Turnips, though only for one season during the four or five years they remain on the farm, is quite sufficient prematurely to destroy the teeth of a large number. Why this should happen with this breed, more than with any other with which we are acquainted, we cannot explain; but such is the case. Most of the Turnips were earthed up before the severe frost set in, the benefit of which is now very apparent. Among those so treated there is scarcely a damaged root, while of those left in their ordinary condition many are completely destroyed, and the rest very soft in their texture. Our ploughing is as far advanced as we can get at present. We have sown a few Peas and Oats, the latter more by way of experiment, the land being in beautiful condition, than because we consider the proper season. In another week, however, should the weather continue fine, we will begin in good earnest. The temperature during the month of February has been 35°, 40°, and 36° at morning, noon, and evening respectively. *A Lammermuir Farmer.*

Sussex Farm, *March* 4.—For the most part of this week our teams will be engaged harrowing and drilling in the remainder of the Beans, Peas, and Tares, and ploughing for the Barley and Oat crops; ploughing the Potato land, and drilling up the same with the swing plough. We make our Potato drills from 27 to 28 inches from row to row, and from plant to plant 12 inches. We have dunged part on the flat, and ploughed in the dung; on the other part we shall put the dung in the drills, and plant the Potatoes on the top of the dung, then cover up with the plough. The farmers and cottagers here, for the most part, put the dung upon the top of the Potatoes. Men are engaged threshing Oats, Beans, and Wheat, emptying the liquid manure tank on to the meadows, digging Hops, sorting Hop-poles, draining, ditching, &c. *J. B.*

Notices to Correspondents.

Cottage Chimneys: *Anon.* Ground floor, 18 inches from front to back; from 30 to 36 inches high, sufficient for the fire-place. Upper story, depth somewhat less, height not more than 24 inches, 20 may be better.

Disease in Lambs: *Aliquis.* The disease appears to be palsy. You are right in adopting external warmth, which may be assisted by the following: Gentian and ginger, of each, 1 scruple; spirit of nitrous ether, 1 do., to be given in warm water or gruel. The secretions, if amiss, of course must be regulated by suitable means. *W. C. S.*

Lame Pig: *Constant Reader.* The disease is probably rheumatism. Keep him warm and dry, and make him into bacon as fast as you can. *W. C. S.*

Mangold Wurzel: *J W.* The scheme of sowing Rape, sheeping and then fallowing it, is good; but we would not repeat the Mangold. Cabbages would pay as well, are as well suited to a clay soil, and are better as a change.

Shoulder Lameness: *B A, Clericus.* If the lameness is really in the shoulder, bleeding in the arm and blistering the shoulder will be the best remedy, followed by sufficient rest. If, however, the pony puts his foot forwards in the stable, and does not rest upon it, the lameness is not in the shoulder, but the foot. *W. C. S.*

Markets.

COVENT GARDEN, March 9.

Vegetables are plentiful, but many kinds of Fruit are still scarce. Hothouse Grapes, excepting the Barbarossa, are over, and Pine-apples are anything but plentiful, as are also Pears and Apples. Walnuts, and Chestnuts are abundant, more especially the latter, and Oranges and Lemons are sufficient for the demand. Amongst Vegetables, Turnips and Carrots are good, and there is some fine Cornwall Broccoli in the market. Potatoes are unaltered since our last account; foreign ones fetch from 50*s.* to 80*s.* a ton. Lettuces and other salading are sufficient for the demand, and so are Mushrooms. French Beans, Asparagus, Seakale, and Rhubarb may be obtained at about last week's prices. Cut Flowers consist of Heaths, Pelargoniums, Bignonia venusta, Primulas, Camellias, Cinerarias, Christmas Roses, Azaleas, Lilacs, Lily of the Valley, Epacrises, Acacias, and Roses.

Celery, p. bundle, 8d to 1s 3d	Corn Salad, p. hf. sieve, 9d to 1s

POTATOES.—Southwark, March 4.

The Committee report that the arrivals during the last week have been very considerable, particularly from the Continent, which is larger than it ever has been in one week since the importation has been free; this, with the very mild weather, has caused trade to be very heavy, and a considerable reduction is submitted to with every description of Potato at the waterside. The following are this day's quotations:—Yorkshire Regents, 80s. to 110s. per ton; Wisbeach do., 60s. to 80s.; Scotch do., 60s. to 75s.; Scotch cups, 60s. to 70s.; French whites, 60s. to 70s.; Belgian do., 60s. to 65s.; Rhenish do., 50s. to 60s.

HOPS.—Friday, March 8.

Messrs. Pattenden and Smith report that the trade is very heavy, and what little demand we have is for 1847 and fine yearlings.

Mid. and East Kents ...	p. cwt. 160s to 240s	Farnhams, p. cwt.	—s — —s
Weald of Kents ...	140 — 160	Yearling Kents ...	45 — 80

Old Clover	78 84		Joshua Baker.

SMITHFIELD, Monday, March 4.

The number of Beasts being much smaller than on Monday last, a little more money is obtained in a few instances, but generally the trade is dull; however, a fair clearance is effected. The supply of Sheep is about an average; the demand is small, consequently trade is dull, and our top quotations are with difficulty realised. We are but moderately supplied with good Calves; they are, in consequence, dearer. From Holland and Germany we have 503 Beasts, 300 Sheep, and 60 Calves; from France, 170 Sheep; from Scotland, 300 Beasts; from Norfolk and Suffolk, 2000; and 300 from the midland counties.

Per st. of 8 lbs.—	s	d	s	d	Per st. of 8 lbs.—	s	d	s	d

Beasts, 3352; Sheep and Lambs, 19,300; Calves, 106; Pigs, 192.

Friday, March 8.

The supply of Beasts to-day is good, both as regards numbers and quality, and the demand is very limited. Our quotations are the same as on Monday, but they are not so currently obtained. We have an average number of Sheep; trade is very dull, and late rates are with much difficulty maintained. We have several Lambs on offer; the season cannot yet be said to have set in, the consumption is, in consequence, very small; a choice one makes about 6*s.* per 8 lbs. Trade is very dull for Calves, and late prices are scarcely maintained. From Holland and Germany there are 76 Beasts, 170 Sheep, and 109 Calves; from France, 120 Sheep; from Scotland, 350 Beasts; and 123 Milch Cows from the home counties.

Beasts, 911; Sheep and Lambs, 3930; Calves, 212; Pigs, 215.

MARK LANE.

Monday, March 4.—The supply of Wheat from Essex, Kent, and Suffolk this morning was small, and sold at the prices of this day se'nnight, excepting the Kent, which is written 1s. per qr. lower. There appeared to be a slightly increased inquiry for foreign, but buyers being only inclined to purchase on reduced terms, the business transacted was limited and quite in retail.—We make no alteration in our quotations of Barley, Beans, or Peas.—Oats are rather more in demand, but not dearer.—The top price of Flour is 2s. per sack lower, and settled at 38s.

Friday, March 8.—The supplies of all grain during the week have been small. To-day's market was badly attended, and in the little business transacted in Wheat, Monday's prices were barely supported.—Spring corn of all descriptions continues a dull sale, but we observe no alteration in its value.—The corn trade continues in the same depressed state which has characterised it lately, and the value of Wheat in many of the leading markets of the kingdom has declined 1s. to 2s. per qr. during the past week. Spring corn has also been very dull, and prices the turn lower. The sale of Flour is still much interfered with by importations from France, and it is 1s. to 2s. per sack cheaper. From a statement lately published it appears that our chief supplies of Wheat last year were derived as follows:

France... ...	Qrs.—742,023	Hanse Towns and adjacent Ports	Qrs.—498,983
Prussia	618,735	Belgium	366,098
United States ...	617,181	Holland	308,482
Russia	600,375		

And further, that the average price for the last 10 years was—

Liverpool, Tuesday, March 5.—There was a better attendance at this morning's market, and business was on a moderate scale, at a decline on the rates of last week of 2d. to 3d. per bush. on Wheat, 1s. per sack on Flour, 1s. per qr. on Barley, 6d. per qr. on Beans and Peas, and 1s per qr. on Indian Corn.

HARTLEY'S PATENT ROUGH PLATE GLASS.

In submitting our list of prices, we would beg to direct attention to the Leading Article of the *Gardeners' Chronicle* of Saturday, Dec. 8, upon the subject of "Patent Rough Plate." Some alteration having been made in the mode of manufacturing this description of Glass, the quality is greatly improved, and we now supply it perfectly flat, and, by an arrangement with Messrs. Hartley and Co., precisely at their prices. Cut to order in panes of

8 by 6	and under 10 by 8	at 4½*d.* per foot.	
10 by 8	„ 14 by 10	at 5*d.*	„
14 by 10	„ 1½ foot	at 5½*d.*	„
1½ foot	„ 3 feet	at 6*d.*	„

PACKED IN BOXES of 50 feet each.

6 by 4 and 6½ by 4½...10*s.* 6*d.* 8 by 6 and 8½ by 6½...13*s.* 6*d.*
7 by 5 and 7½ by 5½...12*s.* 0*d.* 9 by 7 and 10 by 8 ...15*s.* 0*d.*

Milk Pans from 2*s.* to 6*s.* each, Metal Hand-frames, Tiles, and Slates; Propagating and Bee Glasses from 2*d.* each; Cucumber Tubes, 1*d.* per inch; Peach Glasses, 10*d.* each; Wasp Traps, 3*s.* 6*d.* per dozen; Pastry Slabs, Hyacinth Glasses and Dishes, Shades for Ornaments, Fish Globes, Plate and Window Glass of every description, and Lamp Shades. Lactometers for trying the quality of Milk, 4 tubes, 7*s.* 6*d*; 6 tubes, 10*s.* Self-registering Thermometers for Greenhouses, Horticultural Glass, &c.

JAMES PHILLIPS and CO., 116, BISHOPSGATE STREET WITHOUT, LONDON.

CROWN, SHEET, AND ROUGH PLATE GLASS FOR HOTHOUSES, CONSERVATORIES, &c.

Of every manufacture FIT FOR USE, including the make of Messrs. Chance, Hartley, Swinburne, and others.

100 and 200 feet cases of large Sheet Glass, from 2½*d.* per foot. Small ditto, 10*s.* 6*d.* per 100 feet, packed in boxes ready for immediate delivery. Curators of Botanical Societies, Florists, Railway Agents, and others requiring large quantities, will, on sending dimensions, receive estimates at the lowest prices.

GLASS MILK PANS, CREAM POTS, Lactometers, Bee Glasses, Fish Globes, and all kinds of Dairy Glass, Propagating Glasses, Hyacinth Dishes, Cucumber Tubes, and every other description of Garden Glasses.

PATENT GLASS PENS, self supplying, never blot, never soil the ruler, and will write continuously for 12 hours.

Also, Glass Rulers, Glass Inks for office-stands, desks, &c. Stationers and Schools supplied. Wholesale Warehouse for Ornamental Shades, Lamp Shades, Gas Glasses, Genuine White Lead, Paints, Colours, and Pumps for Farm purposes.

Our Catalogue of 18 folios is the most complete ever published. No Gardener or Farm Bailiff should be without one. May be had Gratis on sending two postage stamps to Messrs. Cogan and Co., 48, Leicester-square, London.

GLASS FOR CONSERVATORIES, HORTICULTURAL PURPOSES, &c.

TILLINGTON'S SHEET GLASS, which is of the best description, varying from 16 to 32 ounces, at from 2*d.* per foot and upwards; 100 feet and 200 feet cases of large Sheet Glass, for cutting up, at 2½*d.* per foot. British Plate Glass, from 1*s.* 2*d.* to 2*s.* per foot, according to size. Patent Rough Plate Glass, from ⅛ to 1 inch in thickness, from 4*d.* per foot upwards. Glass Slates and Tiles. Milk Pans from 12 to 24 inches diameter, from 2*s.* to 5*s.* each. Cucumber Tubes, from 12 to 24 inches long, at 1*d.* per inch. Lactometers, 7*s.* 6*d.* each. Wasp Traps.—Lists may be had, on application at the Warehouse, 87, Bishopsgate-street Without, same side as the Eastern Counties Railway.

GLASS PIPES.

MESSRS. COATHUPES and Co., Glass Manufacturers, of Bristol, and of Nailsea, Somerset, beg to inform Engineers and others, that they are prepared to supply GLASS PIPES of from 1 to 4-inch bore, in lengths of from 3 to 7 feet; the lengths being less as the diameters of the bores increase.

STEPHENSON and Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

DR. NEWINGTON'S HAND-DRILL HOES, with their various fittings; Hand-Dibbles, with from 6 to 9 depositors each, Wheel-Dibbles, Drop-drills, and Hand-sowing Implements for dropping seed at defined intervals in the seams of the plough, or in pressed land, or in drills. A Prospectus and Lecture on Seeding sent gratis on application to Messrs. Dufaur and Co., Agricultural Depôt, 21, Red Lion-square, Holborn, London. The above Dibbles received the prize given by the Royal Agricultural Society at Norwich.

EMIGRATION to the AUSTRALIAN COLONIES.—For ADELAIDE, PORT PHILLIP, and SYDNEY, the fine, 1st-class, teak-built ship ORIENTAL, Capt. J. P. TAYLOR, 1000 tons, coppered and copper-fastened; will sail from the St. Katharine's Docks on or about the 15th of March, calling at Plymouth. This very superior ship is fitted up expressly for the comfort of passengers, and from her great height 'tween decks, which are admirably lighted and ventilated, offers accommodation rarely to be met with. All the cabins are enclosed and of an extra size, for families and married couples. The passage money, 20 guineas each adult, including bedding, mess utensils, and provisions, which will be ample in quantity (see dietary scale), and excellent in quality, for which a guarantee will be given, and in addition, passengers are invited to be present at their inspection. There will be a library on board. There is a most magnificent poop and saloon of very large size, with elegant accommodation for cabin passengers. A skilful surgeon will proceed in the ship. For freight, passage, and all particulars, apply to John Whittakers, 78, Mark-lane; or to W. H. Brufton, 89, Great Tower-street, London.

Sales by Auction.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, & Others.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions from Mr. John Smith, to submit to public competition by Auction, on the premises, Dalston Nursery, Middlesex, on MONDAY, March 11, and following day, at 11 o'clock (in consequence of the premises being required by the London and Birmingham West India Dock Junction Railway Company), the valuable NURSERY STOCK, consisting of a very superior assortment of large Evergreens, American Plants, Ornamental Trees, and Deciduous Shrubs, Fruit and Forest Trees in great variety, fine Ivies, Roses in pots, &c.—May be viewed prior to the sale. Catalogues may be had, 6*d.* each (returnable to purchasers), on the premises; the Shop, Covent-garden; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

BRENTFORD.

To NOBLEMEN, GENTLEMEN, NURSERYMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed to submit to public competition by Auction, on the premises, Brentford Nursery, Brentford, Middlesex, on MONDAY, the 18th March, and following days, by order of the Executors of the late Mr. John Ronalds, the first portion of the valuable NURSERY STOCK, consisting of Evergreens and Fruit Trees, also the choice Greenhouse Plants, together with two Greenhouses, several two and three-light Boxes, Hand-lights, Hot-water Pipe, Boilers, Seed-shop Fixtures, Horses and Carts, capital Chaise, a quantity of Bricks, Garden-pots, &c. *** Further particulars will be given in next week's Paper.—American Nursery, Leytonstone, Essex.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will submit to public competition by Auction, at the Auction Mart, Bartholomew-lane, on WEDNESDAY, March 13th, and following day, at 12 o'clock, a first-rate collection of CARNATIONS and PICOTEES; also choice Camellias well set with bloom-buds, Standard and Dwarf Roses, Dahlias, Gooseberries, &c.—May be viewed the morning of sale. Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

CHOICE CAMELLIAS.

FOR SALE BY AUCTION, AT MESSRS. LODDIGES' NURSERY, HACKNEY.

MR. J. C. STEVENS is directed by Messrs. Loddiges to sell by Auction, on their Premises at Hackney, on TUESDAY, the 19th, and WEDNESDAY, the 20th of March, at 12 for 1 o'clock, a selection of about 1000 CAMELLIAS, from 3 to 12 feet high, beautifully formed plants, well furnished with bloom-buds, and comprising many Double White, Candidissima, Donckelarii, Aulica, and other choice sorts; also a few fine specimens of Araucaria excelsa, 4 to 5 feet, Rhododendrons robustum and campanulatum, 3 to 5 feet. Handsome Plants of Andromeda floribunda in flower, and some Limes in fruit.—May be viewed the day before the Sale, and Catalogues had on the Premises, and of Mr. J. C. Stevens, 38, King-street, Covent-garden.

HARDY CONIFERS, WELL DESERVING THE ATTENTION OF THE GROWERS OF THIS INTERESTING TRIBE.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King-street, Covent-garden, on FRIDAY, 22d March, at 12 for 1 o'clock, the following HARDY CONIFERÆ, &c.: 2000 Cedrus Deodara, from 6 inches to 2 feet; 200 Araucaria imbricata, from 12 to 18 inches; 50 Abies Khutrow, 1 foot to 1½ foot; 200 Pinus Gerardiana, 4 years old; 100 Pinus excelsa, 12 to 18 inches; 40 Cupressus torulosa, 12 to 18 inches; 12 Picea cephalonica, 1 foot; 25 Picea Webbiana, 3 years old; 6 of the rare Araucaria Bidwellii, 8 inches; 25 Quercus Fordii, 1½ to 2 feet; and 100 Corræa speciosa major, 1 to 2 feet, well set with bloom.—May be viewed the day prior and morning of sale, and Catalogues had.

AMERICAN PLANTS, STANDARD ROSES, ORNAMENTAL TREES, EVERGREENS, &c.

MR. D. A. RAMSAY has been favoured with instructions, from an eminent Firm, to sell by Auction, on the premises, Brompton Nursery, Fulham-road, Brompton, on MONDAY, March 11th, and following day, at 12 o'clock each day, without reserve, a further consignment of choice AMERICAN PLANTS, comprising 700 Rhododendrons, 2 to 4 feet, 200 Scarlet Rhododendrons, a quantity of Azaleas, Andromedas, Hardy Heaths, Sedum, &c.; a quantity of strong Grape Vines, Figs, Standard and Dwarf-trained Fruit Trees, a choice assortment of Clematis, Jasmine, and other Creepers, 500 Standard, Dwarf, and Climbing Roses, 5000 large Evergreens in variety, 3000 Limes, Acacia, Willow, Poplar, and other ornamental Trees, with a quantity of Deciduous Shrubs, and other Nursery Stock.—May be viewed three days prior to the Sale, and Catalogues had, 6*d.* each, returnable to purchasers, at the usual Seed Shops, and of the Auctioneer, Brompton Nursery, Fulham-road, Brompton.

TO BE LET, for a term of years, on a CORN RENT, a FARM, in one of the Midland Counties, within two miles of a Market Town and Railway Station. It consists of about 200 acres, 18 of which are in Water Meadow, 28 in Pasture, and the remainder are excellent Turnip and Barley soil. The whole is of a first-rate quality. The Farm Buildings have been lately erected, are on a most complete and comprehensive plan, and are in excellent repair; and the Farm-house possesses every convenience and accommodation required by a respectable family. This Farm is in an excellent state of cultivation. All the interior hedge-rows and timber have been grubbed up; and the arable land is formed into four fields, divided by excellent roads. The Farm is, and has been for some time, under the 4-field system of cultivation. To a gentlemen possessing the requisite capital and ability, who can carry out a good system of agriculture, this Farm is well adapted. Entry at Lady-day. Apply to Mr. John Morton, Whitfield, Berkeley, Gloucestershire.

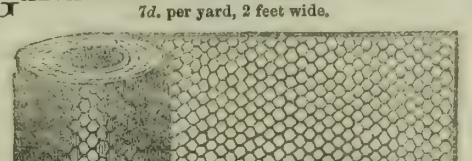
TO BE DISPOSED OF, a NURSERY, within two miles of London, with every convenience for carrying on an extensive business; it contains 10 large Greenhouses, and about 200 lights of Pits and Frames, all in excellent repair; together with many thousands of various plants in good order, and fit for immediate sale. Also two substantial Dwelling-houses let to respectable tenants, which nearly pay the rent. —For further particulars, application to be made personally to A. B., 14, Sommerford-grove, Stoke Newington-road, near London.

TO MANUFACTURERS OF MANURES AND PURVEYORS OF AGRICULTURAL STUFFS.

TO BE SOLD OR LET, SOME SPACIOUS MILLS, with Water and Steam Power, formerly occupied for the manufacture of cloth, with good Dwelling Houses, situate at Chalford, in the centre of the important and improving hill and vale agricultural district of Gloucestershire. This property is close to the Thames and Severn Canal, and to a station on the Great Western Railway; and this extensive field for such operations is unoccupied.—Apply to Messrs. Lawrence, Cirencester.

TO NURSERYMEN AND OTHERS.—LOUTH.

TO BE LET, from year to year, or for a Term of Years, from Old Lady-day next, all that old-established and well-accustomed NURSERY situate near the River Head in Louth, Lincolnshire, containing about six acres, together with a comfortable Dwelling-house standing thereon, and also a Garden House and various Brick and Glass Frames, now or late in the the occupation of Mr. Thomas Cocking. The land is in a good state of cultivation, has various fine Beech and Privet hedges thereon, and is well adapted for the raising of Plants, Shrubs, and Trees, and presents a rare opportunity for persons in the above Business taking an advantageous situation, there being no other Nursery of any magnitude within many miles of the town of Louth. The incoming tenant would most probably have the option of purchasing at a low valuation a quantity of Seedling and other plants and Trees, which may be on the premises undisposed of on the 6th of April next. —For further particulars apply to Goe and Wilson, Solicitors, Louth.



WANTED, a FARM of from 140 to 160 acres, not more than 15 or 16 miles from London, within an easy distance of a Station on the Croydon or North Kent Line of Railway. Light soil preferred. The dwelling-house to be a good one, with two sitting-rooms and six bed-rooms.—Apply, with full particulars, by letter, post paid, to A. B., 30, Leadenhall-street, London.

STALLIONS FOR SALE.—Two five-year-old Suffolk Stallions, the property of T. Beale Browne, Esq., Hampen, Andoversford, Gloucestershire. One is 17 hands high, the other over 16. They are sure foal getters, and were much admired and highly commended by the Judges at the Royal Agricultural Society's Show at York.

Also two very fine five-year-old Suffolk Geldings.

FOR SALE, THE GARDENERS' CHRONICLE, from 1843 to 1848 inclusive, handsomely half-bound, in six volumes, and perfectly new. Price 4*l.*—Apply to Smith, Elder, and Co., 65, Cornhill, London, where one of the volumes may be seen.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

	Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide ...	7*d.* per yd.	5*d.* per yd.
2-inch .. strong ,, ...	9 ,,	6½ ,,
2-inch ,, extra strong ,, ...	12 ,,	9 ,,
1⅝-inch ,, light ,, ...	8 ,,	6 ,,
1⅝-inch ,, strong ,, ...	10 ,,	8 ,,
1⅝-inch ,, extra strong ,, ...	14 ,,	11 ,,

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG AND COMPANY (late W. and C. YOUNG),

MANUFACTURERS OF IRON AND WIRE WORK, &c., 22, Parliament-street, Westminster, London; Castle-Buildings, Derby-square, Liverpool; 128, High-street, Edinburgh; and 32, St. Enoch-square, Glasgow, beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

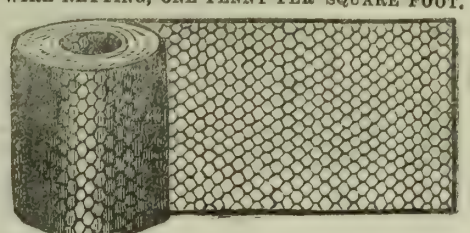
This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

Prices.—18 ins. high, 9*d.*; 24 ins., 1*s.*; 30 ins., 1*s.* 3*d.*; and 36 ins., 1*s.* 6*d.* per lineal yard.

Or a web of 100 yards, 18 ins. wide, will cost	..	£3	15 0
Do. of 100 yards, 24 ins. wide	.. ..	5	0 0
Do. of 100 yards, 30 ins. wide	.. ..	6	5 0
Do. of 100 yards, 36 ins. wide	.. ..	7	10 0

If more or less than a web is required, it would be charged at the same rate per yard.



This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. Young and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1*s.* is equal to 2½ yards of another article in the market, the same width, at 9*d.* per yard. Samples for inspection sent free of expense.

C. D. Young & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland

WIRE NETTING, ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

12	inches wide	3*d.*	per yard	30	inches wide	7½*d.*	per yard
18	,, ,,	4½*d.*	,,	36	,, ,,	9*d.*	,,
14	,, ,,	6*d.*	,,	48	,, ,,	1*s.*	,,

Galvanised do., 1*d.* per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards, Wire House Lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s.* each; Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of Thomas Henry Fox, 44, Skinner-street, Snow-hill, London.

MESSRS. NESBIT'S CHEMICAL AND AGRICULTURAL SCHOOL, 38, Kennington-lane, London.—A sound practical knowledge of Analytical and Agricultural Chemistry, Geology, Surveying, Levelling, Railway Engineering, &c., may be obtained in Messrs. Nesbit's Academy, in addition to a good modern education.

Mr. Nesbit's works on Arithmetic, Mensuration, Gauging, Land Surveying, English Parsing, &c., are published by Longman and Co., and may be had of all Booksellers.

The terms of the School can be had on application either personally or by letter.

WINDMILLS, for Raising Water and other agricultural purposes, for sale, at a very moderate expense. May be seen in working order by applying to Mr. W. Nash, Ball's-pond, Islington, opposite the Church.

N.B.—Estimates given for Fixing in any part of the country. The above are also manufactured for the Colonies.

STOUT AND PORTER.—JENNER, WICKING, and JENNER are now delivering, for cash, to private families, their celebrated PORTER at 1*s.*, and imperial Stout at 16*d.* per gallon. May be had in casks of 4½, 9, 18, and 36 gallons. N. B. Their Ales are now in very fine condition.

South London Brewery, Southwark-bridge-road.

ALLSOPP'S BURTON AND EAST INDIA PALE ALES.—Messrs. S. Allsopp and Sons beg to call the attention of the public to their East India, Pale, and other Burton Ales, which may be obtained in casks of 18 gallons and upwards, either singly or in any quantity, by application to the Brewery, Burton-on-Trent, or on the same terms at their respective Stores, as follows:—61, King William-street, London; Cook-street, Liverpool; under the Exchange, Ducie-place, Manchester; and at the Market-place, High-street, Birmingham.

NEWS, NEWS, NEWS.—The best, cheapest, and largest Newspaper in the World.—LLOYD'S WEEKLY LONDON NEWSPAPER contains 60 large columns of the latest intelligence from all parts of the Globe, price only Threepence, postage free. Send Three Postage Stamps to E. Lloyd, 12, Salisbury-square, London, and receive one copy as a sample.

BEAUTIFUL TEETH.

ROWLAND'S ODONTO, OR PEARL DENTIFRICE. A white Powder, compounded of the choicest and most *recherché* Ingredients of the Oriental Herbal, of inestimable value in preserving and beautifying the Teeth, strengthening the Gums, and in giving sweetness and perfume to the Breath. It extirpates all tartarous adhesions to the Teeth, and ensures a pearl-like whiteness to the enamelled surface. Its Anti-Septic and Anti-Scorbutic properties exercise a highly beneficial and salutary influence; they arrest the further progress of decay of the Teeth, induce a healthy action of the Gums, and cause them to assume the brightness and colour indicative of perfect soundness; while, by confirming their adhesion to the Teeth, they give unlimited enjoyment and fresh zest to appetite, by perpetuating effective and complete mastication. The Proprietors of this Dentifrice pledge themselves that its efficacy in preserving and embellishing the Teeth far surpasses anything of the kind ever yet offered to the public, and has, in consequence, obtained its selection by Her Majesty the Queen, the Court and Royal Family of Great Britain, and the Sovereigns and Nobility of Europe.—Price 2*s.* 9*d.* per box.

CAUTION.—To protect the public from fraud, the Hon. Commissioners have directed the Proprietors' Name and Address, thus—"A. ROWLAND and SON, 20, Hatton Garden," to be engraved on the Government Stamp, which is affixed on each box. Sold by the Proprietors and by Chemists and Perfumers.

A WONDERFUL WORK-BOX.—According to an Enigma, to be published in No. 18 of *The Family Friend*, for March the 15th, an ordinary Work-box is capable of containing a Lion, an Elephant, a Tiger, a Stag, a Dragon, a Peacock, a Goat, and numerous other animals, all alive, and to each one may be allowed a cage. In addition to this menagerie, there may be exhibited, within the work-box, a Magic Lantern, by which may be shown a Living Ghost—

"And as uncommon things the most make common people stare,
(And giants are uncommon) great Goliah shall be there!"

A Gold Watch, value Ten Guineas, is offered to the person who produces the best Solution: there are two other Prizes for the Second and Third-best Solutions. The readers of the *Gardeners' Chronicle* may obtain the Number which contains this interesting Enigma, and the Conditions of the Award, by order of any bookseller, price Twopence. The competition will remain open until the 10th of April. The Editor guarantees that the Enigma is capable of a fair Solution. *The Family Friend* is published upon the 1st and 15th of each month, and enjoys a circulation of 60,000. New subscribers are advised to order Vol. I. price 2*s.* 6*d.*; and Nos. 13 to 18, price 2*d.* each, they will thus have the Work complete up to the present date.

London: Houlston and Stoneman, 65, Paternoster-row.

WIRE STRAND FENCING, as fixed by R. S. NEWALL and Co., is cheaper, stronger, more durable and elegant than any other Fence hitherto introduced.

COPPER WIRE HOTHOUSE SASH LINE.
LIGHTNING CONDUCTORS.

Office, 130, Strand, London; Warehouse, Brunswick-street, Blackwall; Manufactory, Gateshead, on Tyne.

AUSTRALIA, NEW ZEALAND, CAPE OF GOOD HOPE, NATAL, &c.

PASSENGERS to the COLONIES generally may obtain their OUTFITS from S. W. SILVER and CO., CLOTHIERS, &c., 66 and 67, CORNHILL, at wholesale prices. SILVER and CO. make nearly the whole of the articles comprised in an outfit, to secure durability, so that the Cabin Folding Furniture may become permanent Household Furniture on arrival in the colony.

They also engage PASSAGES, and give ship sailing INFORMATION, but they neither receive nor pay a commission—their object being to give PASSENGERS who place themselves in their hands every benefit; and they forward small packages for their customers (gratis) through their AGENTS in the COLONIES.

SILVER and CO. give DRAFTS on AUSTRALIA at sixty days' sight of 103*l.* for every 100*l.* paid here.

The EMIGRANT Fitting-out Branch is at No. 4, Bishopsgate-street, opposite the London Tavern, where a comfortable fit-out for male or female, including bedding, may be obtained for FOUR POUNDS.

A Branch of each at ST. GEORGE'S-CRESCENT, LIVERPOOL.

TRY THAT FAMOUS REMEDY, PARR'S LIFE PILLS.—It is a fact beyond dispute, that most of the diseases with which the human race are afflicted are the result of a disordered state of the blood. To remedy this, the occasional use of PARR'S LIFE PILLS should be had recourse to, and sickness prevented as well as cured. In their operation they go direct to the disease. After you have taken six or twelve Pills you will experience their effect; the disease upon you will become less and less by every dose you take; and if you will persevere in regularly taking from three to four Pills every day, your disease will speedily be entirely removed from the system. None are genuine, unless the words "PARR'S LIFE PILLS" are in White Letters on a round ground, on the Government Stamp, pasted round each box; also the *fac simile* of the Signature of the Proprietors, "T. ROBERTS and Co., Crane-court, Fleet-street, London," on the Directions. Sold in boxes at 1*s.* 1½*d.*, 2*s.* 9*d.*, and family packets 11*s.* each. Sold by all Chemists. Also a certain and speedy cure for Influenza, Coughs, Colds, Asthma, Incipient Consumptions, and all disorders of the Chest and Lungs, SPENCER'S PULMONIC ELIXIR, carefully prepared from the recipe of the late C. Spencer, Surgeon, &c., Salford, Manchester; deservedly celebrated as the most successful practitioner in all Pulmonic Affections. Persons desirous of testing the efficacy of this medicine, must observe that on each bottle are the words "SPENCER'S PULMONIC ELIXIR," and that each wrapper has a *fac simile* of the Proprietor's Signature, "T. ROBERTS and Co."—Prepared only by T. ROBERTS and Co., Crane-court, Fleet-street, London; sold wholesale by EDWARDS, 67, St. Paul's Churchyard; BARCLAY and SONS, Farringdon-street; SUTTON and Co., Bow Churchyard, London; and all respectable Medicine Vendors in the Kingdom. In bottles at 1*s.* 1½*d.* and 2*s.* 9*d.* each.

*** The bottles at 2*s.* 9*d.* contain nearly three small.

SPASMS IN THE STOMACH, FLATULENCY, AND INDIGESTION, CURED BY HOLLOWAY'S PILLS.—Extract of a letter from Mr. Dalwood, of Goodwood, near Sydney, New South Wales, dated Sept. 14, 1849. "To Professor HOLLOWAY. Sir—Having had an experimental knowledge of the good effect produced by your valuable Pills, I consider it my duty to make it known that two years ago, my daughter, then 16 years old, had suffered for a long time with cramps in the stomach, flatulency, and indigestion. I tried various remedies without benefit, but a few doses of your wonderful Pills have restored her to perfect health, and she is entirely free from any symptoms of her former complaint."—Sold by all vendors of medicine, and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

"NORTON'S"

CAMOMILE PILLS are confidently recommended as a simple but certain Remedy, to all who suffer from Indigestion, Sick Head-Ache, Bilious and Liver Complaints, Heartburn, and Acidity of the Stomach, Depressed Spirits, Disturbed Sleep, Violent Palpitations, Spasms, General Debility, Costiveness, &c. They act as a powerful tonic and gentle aperient; are mild in their operation, safe under any circumstances, and thousands of persons can now bear testimony to the benefits to be derived from their use. Sold in bottles at 1*s.* 1½*d.*, 2*s.* 9*d.*, and 11*s.* each, in every town in the kingdom.

CAUTION.—Be sure to ask for "NORTON'S PILLS," and do not be persuaded to purchase an imitation.

METCALFE AND CO.'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1*s.* An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY, and Co.'s Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2*s.* per box.

CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

DEAFNESS.—New Discovery.—THE ORGANIC VIBRATOR, an extraordinarily powerful, small, newly-invented instrument, for deafness, entirely different from all others, to surpass anything of the kind that has been, or probably ever can be, produced. It is modelled to the ear, so that it rests within, without projecting. Being of the same colour as the skin, it is not perceptible. Enables deaf persons to enjoy general conversation, to hear distinctly at church and at public assemblies. The unpleasant sensation of singing noises in the ears is entirely removed, and it affords all the assistance that possibly could be desired. Also, invaluable newly-invented SPECTACLES.—S. and B. SOLOMONS, Aurists and Opticians, 39, Albemarle-street, Piccadilly, London.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn-place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the County of Middlesex, Printers, at their office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said county, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, MARCH 9, 1850.

Gateshead Nursery, Newcastle-upon-Tyne.

KITLEY'S GOLIAH STRAWBERRY.

JAMES KITLEY, in again bringing his SEEDLING STRAWBERRY before the notice of the Public, takes this opportunity of thanking those Friends who so liberally purchased in the autumn, and it being now the best time for planting, begs to inform them that he has a fine stock of healthy plants, which have been transplanted. See extracts from the *Gardeners' Chronicle.*

From the *Gardeners' Chronicle.*—"STRAWBERRIES: *J. K.* Your Seedling Strawberry, 'Goliah,' judging from its size and appearance, is worthy of cultivation."

From the Gardeners and Farmers' Journal.—"STRAWBERRIES: *J. K., Lyncombe Vale.* We have great pleasure in bearing testimony to the exquisite flavour of your Seedling Strawberry, 'Goliah.' In our opinion it combines the piquant flavour of the Strawberry with the richness of the Pine, the delicious aroma of which it partakes in equal proportion with the taste. Apart from the queen of fruits, we certainly do not remember anything in this way that conveyed to our senses so delicious a treat as the noble fruit to be known to the world as 'Kitley's Goliah Strawberry.'"

Plants, 12*s.* per doz., or 4*l.* per 100. A liberal allowance to the Trade in plants, when 100 are taken.

Cash orders expected from unknown correspondents.
Lyncombe Vale Nursery, Bath, March 16.

EXHIBITION OF CAMELLIA JAPONICA.—A Collection of these beautiful Exotics is now in bloom at CHANDLER & SONS' Nursery, Vauxhall.—Admittance gratis.

TO PLANTERS AND THE TRADE.

DICKSON AND TURNBULL, NURSERYMEN, &c., Brechin, N.B., beg leave to intimate to Planters and the Trade that they have still on hand several Hundred Thousands of Two Years Transplanted SCOTS FIR, of fine quality, which will be sold cheap.—Brechin, March 16

BURROUGHES'S TWO BEAUTIFUL LIGHT-EDGED PICOTEES—"DUCHESS OF SUTHERLAND," RED, AND "LORINA," PURPLE.

The last named Eight sorts, including postage, for 7*s.*, or 1*s.* each paper.

To be had of WILLIAM DENYER, Seedsman and Florist, 82, Gracechurch-street, London.

N.B.—A Descriptive and Priced Catalogue may be had on application.

FLEMING'S TRENTHAM SCARLET GERANIUM.

J. AND J. FAIRBAIRN having purchased the stock of the above unrivalled SCARLET GERANIUM, which for brilliancy of colour, profuseness of bloom, or adaptation for bedding, far surpasses any other variety yet introduced. This fact was amply borne out by the gorgeous effect produced by this over every other new kind in the magnificent flower garden at Trentham, last summer.

J. and J. F. have much pleasure in announcing that they are prepared to send out strong established plants on and after the 25th inst., at 3*s.* 6*d.* each, or four plants for 10*s.* 6*d.*

Flower Seeds, 18 papers, 5*s.*; 36 ditto, 10*s.*; of the most approved varieties, sent free by post. Also Catalogues for 1850.
Albion Nursery, Stoke Newington, London, March 16.

J. C. WHEELER AND CO.'S SELECT LIST OF THE BEST SEEDS IN CULTIVATION, will be sent free by post on receipt of two postage stamps.

"THE CATALOGUE OF SEEDS SOLD BY J. C. WHEELER AND CO., GLOUCESTER, appears to us to deserve notice, because of the stand which its authors make in common with ourselves and others against the useless, incomprehensible Seed Lists of the day. In this, as in all matters of taste, there will be a difference of opinion as to the relative qualities of varieties; yet the mass of buyers who have no fancies, but who dislike being perplexed, and are satisfied with what is excellent, will greatly prefer a short select Seed List to an interminable labyrinth of names, which, for the most part, represent nonentities or rubbish. Messrs. WHEELER'S little book will do something to satisfy their expectations."—Dr. LINDLEY in the *Gardeners' Chronicle* of the 2d inst.

Kingsholm Nursery, Gloucester.

HART AND NICKLIN, Guildford, having a large and healthy Stock of the undermentioned Plants, offer them at the following low prices:

	£	*s.*	*d.*
GERANIUMS.			
20 First-rate Show Flowers	1	0	0

PANSIES.			
20 New and first-rate Flowers	1	0	0
20 New and good Flowers	0	10	0
12 Good Border Flowers	0	4	0
FUCHSIAS.			
20 New and good varieties	0	10	0
12 ,, ,, ,, ...	0	6	0

VERBENAS.—The following at 6*s.* per doz.:—Louis Napoleon Buonaparte, John Salter, Royal Purple, Brilliant, Princess Alice, Lord of the Isles, Shylock, Viscount de Sourval, Mountain of Snow, Bride, Eyebright, Duchess of Northumberland, La Villageoise, Clotilda, Tommy, Cardinal, Emperor of China, Minerva, Lady of the Lake, and Heloise. Warranted young healthy plants.

Lilium lancifolium album, 9*s.* per doz.; Phlox of vars., 4*s.*; double white Rockets, 3*s.*; border Carnations, 3*s.*

H. and N. beg to observe that they have a good stock on hand of all the above, so that purchasers may rely upon being served with plants immediately. No charge for hamper, &c.; free to any station of the South-Western or South-Eastern Railways. The three last named collections may be sent by post, free. A remittance from unknown correspondents.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND Co. beg to notice their mixtures for laying Land down to Permanent Grass are now ready. The general satisfaction they have given for many years past, and the present low prices of 32*s.* per acre, allowing 2 bushels and 12 lbs. to each acre, they trust will ensure a continuance of orders. Mixed Seeds for improving old Grass Land, 1*s.* 3*d.* per lb.; fine sorts for forming Lawns, 1*s.* 4*d.* per lb. Their Priced List for the season of Turnips, Mangold Wurzel, and other Farm Seeds, will be forwarded on application to 26, Down-street, Piccadilly, London.

CHOICE GERANIUMS AND FANCY GERANIUMS.

HOLDER AND CARROD, NURSERY and SEEDSMEN, Bedford Road, Clapham Rise, beg to offer 12 of the following varieties (strong plants), for 21*s.*, cash. EXHIBITIONS AT THE GARDEN OF THE HORTICULTURAL SOCIETY OF LONDON, FOR THE YEAR 1850.

THE EXHIBITIONS WILL TAKE PLACE ON THE FOLLOWING SATURDAYS:—

MAY 18, JUNE 8, AND JULY 13.

SCHEDULE OF THE PRIZES.

FLOWERS.

Division I.—In which Nurserymen and Private Growers exhibit independently of each other.

A Pelargoniums; in collections of 6 new and first-rate varieties, with perfectly distinct colours, cultivated with superior skill, in 8-inch pots. SG—CE—LS

N.B. The collections in which the varieties are most distinct *will have the preference.*

B Pelargoniums; in collections of six varieties, in 11-inch pots. SG—CE—LS

N.B. Any plant that shall not have been actually grown in 11-inch pots will be disqualified.

C Roses, in pots; in collections of 12 distinct varieties. GB—SG—CE

N.B. To be shown in May and June only, and in 13-inch pots. The Judges will disqualify any collection that shall be found to contain a plant which has been recently placed in the pot from the open ground, or that is shown in a pot of any other size than 13 inches.

D Yellow Roses, best six varieties. SK—SB—C

N.B. To be shown in June only, and really to be yellow; pale cream colours are inadmissible.

E Cape Heaths; in collections of 10 entirely distinct varieties. GB—SG—CE

N.B. It is expected that the same plant shall not be exhibited on more than one occasion. The Judges, in making their award, will give, both in this and the next letter, a marked preference to plants grown in their natural forms, without stakes or stays; and will also take distinctness of species into favourable consideration. No duplicate will be allowable.

F Cape Heaths; in collections of 10 entirely distinct varieties in 11-inch pots. SG—CE—LS

G Carnations, in pans of 24 distinct varieties. SB—C. (*In July only.*)

H Picotees, in pans of 24 distinct varieties. SB—C. (*In July only.*)

I Pinks; in pans of 24 distinct varieties. SB—C. (*In June only.*)

N.B. Carnations, Picotees, and Pinks must be shown without cards, in boxes of four sizes, of the following dimensions:—From centre to centre, 3½ ins.; from centre to outside, 2½ do.; depth at back, 7 ins.; ditto front, 3½ ditto. The face to be painted light green. *No collections will be allowed to exhibit in which these conditions are not complied with.*

Division II.—In which Nurserymen alone can show.

K Exotic Orchids; in collections of 15 species of superior cultivation. GB—SG—CE.

Division III.—In which all persons are admitted to equal competition.

L Calceolarias, in sixes; in 11-inch pots. LS—SK—SB

N.B. To be shown in May and June only.

M Single specimens of very superior cultivation, excluding everything which can be shown singly in other letters, and plants not in flower. CE—LS—SK

N Stove or Greenhouse plants; in collections of 20 plants. LG—GK—GB

N.B. Calceolarias, Fuchsias, Orchids, Pelargoniums and duplicates are excluded from all the four classes of Stove or Greenhouse plants.

O Stove or Greenhouse plants; in collections of 15 plants. GK—GB—SG

P Stove or Greenhouse plants; in collections of 10 plants. GB—SG—CE

Q Stove or Greenhouse plants; in collections of 6 plants. SG—CE—LS

N.B. Exhibitors cannot show in more than one of the classes of Stove or Greenhouse plants.

R Greenhouse Azaleas; in 12 distinct varieties. GB—SG—CE

S Greenhouse Azaleas; in six distinct varieties. SG—CE—LS

N.B. No one can show in both classes of Azaleas.

T Greenhouse Rhododendrons; in six distinct varieties. (*In May only.*) SG—CE—LS

Collections of 6 New Hardy Evergreens grown in pots; Conifers excluded. LS—SK—SB

N.B. Nothing will be regarded as new which has been in the nurseries more than three years.

V Conifers, in sixes, of new or very rare species, in not less than the third year of their growth. LS—SK—SB

N.B. *U* and *V* can only be shown at the exhibition in July.

W Exotic Orchids; in collections of 20 species of superior cultivation. LG—GK—GB

X Exotic Orchids; in collections of 10 species of superior cultivation. GB—SG—CE

Y Exotic Orchids; in collections of six species. SG—CE—LS

N.B. Nurserymen cannot show in either of these three classes of Orchids. No exhibitor can show in more than one of them.

Z Exotic Orchids; single specimens displaying *very* superior cultivation. SK—SB—C

N.B. No duplicate Medals can be here awarded.

AA Fuchsias; in threes, of three distinct colours; *in July only.* LS—SK—SB

BB Pelargoniums; in six DISTINCT SPECIES, exhibiting superior cultivation. CE—LS—SK

N.B. By the word species is meant the wild kinds imported from the Cape of Good Hope, or New Holland, tuberous species inclusive, and not garden cross-breds.

CC Fancy Pelargoniums; in sixes, in 8-inch pots. SG—CE—LS

N.B. No duplicate Medals can be allowed here.

DD Achimenes; in collections of six distinct varieties, exhibiting superior cultivation. CE—LS—SK. (*In July only.*)

EE Six distinct varieties of Tall Cacti in flower. GB—SG—CE

FF Roses of 50 varieties in loose bunches, each consisting of three trusses as they are gathered, so as to exhibit, as far as possible, the habit of the variety. CE—LS—SK

N.B. In July only. No one who exhibits in this letter can also compete in the following.

GG Roses, exhibited as in the letter *FF*, and in 25 varieties. LS—SK—SB. (*Private growers only can exhibit here*).

N.B. In June and July only. If Roses are brought for exhibition without attention to the regulations here explained, they will not be allowed to compete.

HH Helichrysums. CE—LS—SK

I I Kalosanths; in sixes. (*In July only.*) LS—SK—SB

KK Statices; in collections of six species. CE—LS—SK

LL Ferns, in collections of 10 hothouse species of very superior cultivation. LS—SK—SB.

N.B. To be shown in July only.

MM New Hybrid Plants, exclusive of Roses, Rhododendrons, Azaleas, and Garden cross-breds, such as Gloxinias and the like. SG—CE—LS

N.B. It is certain that much may be effected by hybridising plants in common cultivation, such as Lilacs, Honeysuckles, &c. &c. This class will be judged by the Society's officers.

NN Epacrises; in sixes. (*In May only.*) CE—LS—SK

OO Newly introduced or extremely rare ornamental plants in flower; not introduced by the Society. SG—CE—LS

N.B. These Medals will be awarded by the Society's Officers, and not by the usual Judges. Exhibitors will particularly observe that none but new or rare plants can be exhibited under this letter. *Nothing will be regarded as new which has been exhibited in the Garden or Regent-street in a previous season*, nor garden seedlings, hybrids, nor domesticated varieties of any kind. No prizes will be given to New Plants which have been introduced through the Society.

PP Miscellaneous subjects, exclusive of Ferns. SK—SB—C

N.B. Exhibitors under *P P* will not be thereby *entitled* to a pass ticket. Cockscombs, Heartsease, Hydrangeas, and bouquets, together with all plants for which separate prizes are offered as single specimens, are altogether excluded.

QQ Seedling Hybrid Pelargoniums, of entirely new crosses. SB—C

N.B. Every seedling must be shown singly, and marked with the name it is to bear. The same seedling cannot gain a prize more than once in the season. The plants must be shown in pots, and not in a cut state.

RR Alpines; in twelves. SK—SB—C

SS Cinerarias; in sixes, in 6-inch pots. (*In May only.*) SK—SB—C

N.B. Prizes will only be given to extremely fine specimens.

TT Hardy Heaths; in sixes. SB—C.

UU Seedling Florists' Flowers.

A tent will be provided for the exhibition of these; but no medals will be awarded; the Society not wishing to express any opinion upon the merits of seedlings.

FRUIT.

Market Gardeners, or Growers (not Fruiterers), in the habit of supplying the Market, and Private Gardeners, exhibit independently of each other. Fruiterers are not allowed to exhibit at all. No duplicate awards can be made in any case whatever, except in P. No person can take more than one award in each letter except in B, E, K, M, O, P.

N.B. All Fruit must be sufficiently ripe for Market, WELL COLOURED, and PROPERLY NAMED by the Exhibitor, as far as practicable; if the contrary, it will be disqualified.

A Peaches or Nectarines in pots. SK—SB—C

B Pine Apples, in single specimens:—

1. Queens. LS—SK—SB.
2. Enville, Cayennes, Sugarloafs, Black Jamaicas, Otaheites, &c. LS—SK—SB
3. Providences. LS—SK—SB

C Grapes in pots; three specimens to be shown. CE—LS—SK

D Grapes, the heaviest single bunch of any kind. SK

E Grapes; in three bunches for private growers, and six bunches for Market Gardeners:

1. Black Hamburgh, Black Prince, &c. LS—SK—SB
2. White Muscadines, Sweetwaters, &c. LS—SK—SB
3. Muscats. LS—SK—SB
4. Other sorts, distinct from the foregoing. LS—SK—SB

F Peaches, in sixes. SK—SB—C

G Nectarines, in sixes. SK—SB—C

H Apples and Pears of the previous year. SB—C

I Figs, in sixes. SB—C

K Cherries, in dishes of 1lb. each:

1. Black. SB—C
2. White. SB—C

L Strawberries, in pots; six pots to be shown. SK—SB—C

N.B. They must have grown in the pots in which they are shown.

M Strawberries, one dish each:

1. British Queen, &c. SB—C
2. Keens' Seedling, &c. SB—C

N Oranges, Citrons, &c., in pots; no one to show more than one pot. LS—SK—SB

NB. This class of Fruits is excluded if gathered.

O Melons, one specimen each:

1. The heaviest. SK
2. The best flavoured. SK—SB—C

P Other kinds of fruit of peculiar excellence and value.

N.B. The medals under this head will be given at the discretion of the Society's officers.

ADMISSION OF VISITORS.

The Garden will be opened, on each day, to Fellows and to Visitors, at ONE o'Clock, under the following Regulations:—All Fellows of the Society will be admitted without tickets, from One till Six o'Clock, on signing their names in a book at the entrance. Visitors can be admitted only by tickets, to be obtained by the personal or written orders of Fellows of the Society. Upon this subject the Council would observe, that the interests of the Society require Orders for Tickets to be filled up with the NAME and ADDRESS of the parties to whom they are given. The Council also express a hope that the Fellows of the Society will not give orders for tickets to persons with whom they are unacquainted. N. B. *The presentation of the visiting card of a Fellow of the Society cannot be regarded as an authority to receive tickets.* All Fellows who shall apply, on or before Tuesday, the 23d of April, may obtain, at the rate of Three Shillings and Sixpence each, any number of Tickets not exceeding TWENTY-FOUR; but no application for such tickets will be received after that day. *Fellows of the Society subscribing for tickets at this price will be allowed a clear week from the 23d of April, during which they may claim them.* AFTER THAT PERIOD ALL THE 3*s.* 6*d.* TICKETS SUBSCRIBED FOR, BUT NOT ISSUED, MAY BE CANCELLED. After the 23d of April any further number of tickets will be delivered to Fellows on their personal application or written order, at the price of *Five Shillings* each ticket. Each ticket will be available for the admission of one Visitor, after One o'clock, to either of the Three Exhibitions, at the option of the Visitor. All applications for tickets must be made at the Society's Office, 21, Regent-street. NO TICKETS WILL BE ISSUED IN REGENT-STREET ON THE DAYS OF EXHIBITION; but, on those days two Offices, near the Garden Gates, will be opened at noon for the issue of tickets at 7*s.* 6*d.* each; but strictly under the regulations above stated.

CEDRUS DEODARA OR HIMALAYA CEDAR. — The Subscribers beg to inform the admirers and planters of the above hardy Tree, that they have upwards of FIFTY THOUSAND, from one to five years old, in pots, grown from seed, constantly in the open ground, which they are now supplying on such terms as will induce their general introduction into all plantations, being of rapid growth, highly ornamental, and of great value as a Timber tree.

WM. MAULE and SONS, Stapleton-road Nurseries, Bristol.

NEW AND STRIKING VERBENA.

ARTHUR MACKIE begs to offer the undermentioned to the attention of Florists, with the fullest conviction that it will give entire satisfaction.

WOODSTOCK'S MAGNIFICENT.—A. M. having purchased the entire Stock of this unrivalled Verbena, offers it to the Public with the utmost confidence, being fully persuaded that it will surpass everything yet out in its class. The individual flowers cover a sixpence, and sometimes a shilling. It is of a very free habit and growth, and well suited for grouping. See *Gardeners' Chronicle*, Sept. 15, 1849.—"*W. K. B.* Colour bright rose, fading to pink; a remarkably fine variety, with much the largest flowers we have yet seen."

Fine strong plants the 1st of April, at 5*s.* each, free by post. Where three are ordered four will be sent.

MACKIE'S Descriptive Catalogue of Flower and Vegetable Seeds is now ready, and will be forwarded on receipt of two stamps for postage.—Norwich Nursery, Norwich, March 16.

DWARF PEAS.

HAIRS'S Dwarf Green MAMMOTH KNIGHT'S MARROW PEA is perfectly distinct from any other in existence; grows 2 feet, is 3 weeks earlier than the old dwarf Green Knight's, and the Peas and pods are twice the size. 5*s.* per quart.

BISHOP'S LONGPOD.—Grows 2 feet high, early as Early Frames, pods as large as Scymetars, and 20 to 24 per stem. 2*s.* per quart.

BURBIGE'S ECLIPSE.—Grows 1 foot high, pods larger than Imperial, greater bearer, and altogether superior to that variety. 1*s.* per quart.

The above are three of the best Dwarf Peas ever introduced. Full particulars can be had of DUNCAN HAIRS, Seedsman, &c., Wholesale and Retail, 109, St. Martin's-lane, Charing-cross, London.

Catalogues can be furnished on application, and every article connected with the trade supplied on terms to defy competition. Garden Tools, Nets, Mats, Mushroom Spawn, and Potatoes saved from selected stocks at moderate prices.

SEEDS IN COLLECTIONS.
OF THE BEST WHICH CAN BE PROCURED.

BASS AND BROWN beg to offer the following CHOICE VEGETABLE SEEDS.

Complete Collections of the best and newest sorts, in proportionate quantities of each, suited for large or small gardens, at per collection, 1*l.*, 2*l.*, and 3*l.* A Collection for a small garden, of good sorts, at 10*s.* 6*d.* A List of the Collections furnished if required.

SELECT AND CHOICE FLOWER SEEDS,

Free by post, with full directions for sowing, heights, colours, &c.

	s.	*d.*
100 varieties best and newest Annuals	15	0
50 varieties for 8*s.* 6*d.*, 30 for 5*s.* 6*d.*, 20 for	4	0

Remittances with orders are requested from unknown correspondents. Goods carriage free to London, and with all orders of 2*l.* and upwards, articles presented extra. Post-office orders payable to BASS and BROWN or to STEPHEN BROWN.

Our Descriptive Priced Seed and Plant List will be forwarded, prepaid, on application, by forwarding four postage stamps, as copies having the Newspaper stamp are now all distributed.

SEED AND HORTICULTURAL ESTABLISHMENT, SUDBURY, SUFFOLK.

KITCHEN GARDEN AND FLOWER SEEDS.

JOHN CATTELL, NURSERYMAN and SEEDSMAN, Westerham, Kent, begs to offer to the public a few very choice SEEDS, which may be had free by post at the prices annexed.

KITCHEN GARDEN SEEDS.

per packet—	*s.*	*d.*
Beet, Cattell's Dwarf Purple-top...	0	6
Broccoli, Elletson's April White	1	0
„ Wilcove Superb White	1	0
„ Chappell's Cream ...	0	6
„ Jones's Superior White	0	6
Cauliflower, Dwarf Late Walcheren ...	1	0
Cabbage, Cattell's Reliance An improved early dwarf, in quality equal to his well known "Barnes," and may, like that, be sown the middle of July without fear of running to seed the following spring; it is particularly hardy, and being suitable for all seasons, may be depended on for being the earliest and best Cabbage known.	1	0
Cabbage, Cattell's Green Colewort	0	6
„ Do., Dwarf Barnes	0	6
„ Do., Nonpareil ...	0	6
Savoy, Dwarf Drumhead	0	6

per packet—	*s.*	*d.*
Scotch Kale, fine feathered	0	6
„ Dwarf curled ...	0	6
Celery, Cole's Superb Red	1	0
„ Red solid	0	6
„ Seymour's Superb White	0	6
Cucumber, Sion House	1*s.* per doz. seeds	
„ Do., Improved ...		
„ Manchester Prize		
„ Man of Kent ...		
„ Bath Victory ...		
„ Roman Emperor		
„ Carpenter's Wonder		
„ WarwickshireHero		
„ Cuthill's Blk. Spine		
Melon, Bromham-hall, 6 seeds	2	6
Lettuce, fine black seed Green Cos ...	0	6
„ Do., Brown Bath Cos	0	6
„ Marseilles (handsome Cabbage) ...	0	6
Parsley, exquisite curled	0	6
„ fine curled Giant ...	0	6
Vegetable Marrow, true white	0	6
Leek, Musselborough ...	0	6
Parsnip, Guernsey, fine large hollow-crowned...	0	6

FLOWER SEEDS.

Ipomœa Burridgii, splendid red variety of Convolvulus major	1	0	Jacobæa, extra fine, dble. purple	0	6
„ purpurea splendens, or new dark Convolvulus major ...	0	6	Indian Pink, extra fine ...	1	0
Ipomopsis elegans ...	1	0	„ „ fine fringed	0	6
Portulaca alba striata ...	1	0	Calceolaria, from first-rate sorts, impregnated ...	2	6
„ Thorburnii	1	0	Stock, red Intermediate; this is the best Stock for early spring flowering; more than two-thirds come double ...	0	6
Pentstemon speciosum ...	1	0			
Do., per half-ounce	7	6			
Rhodanthe Manglesii ...	1	0			
Coreopsis nigra speciosa, fine...	0	6	Primula sinensis, extra fine fringed, red and white mixed	1	0
Nemophila maculata ...	1	0	Larkspur, dwarf double		
Phlox Drummondii alba, true	1	0	Rocket, extra fine mixed	0	6

J. C. begs also to offer as usual fine strong plants of his true and improved sorts of Early and Cattle Cabbage, price, including package, 4*s.* 6*d.* per 1000, carriage paid to the Edenbridge station, South Eastern Railway. A Post-office order or postage stamps to accompany all orders from unknown correspondents.

BROMHAM-HALL GREEN-FLESH MELON IS THE FINEST FLAVOURED IN THE WORLD.

EDWARD TILEY having become possessed of the whole stock of Seed of that very superior MELON called "BROMHAM-HALL GREEN-FLESH MELON," he is now sending out good sound Seeds at 2*s.* 6*d.* per packet of 6 seeds; larger do. of 15 seeds, 5*s.* per packet. For further particulars of the above, see Advertisement in this Paper, February 9th. Also the following fine varieties can be highly recommended:

	s.	*d.*	
Queen Melon	1	6	per packet.
Bowood Green-flesh	1	0	„
Beechwood do.	1	0	„
Windsor Prize do.	1	0	„
Emperor	1	0	„
Fleming's Trentham Hybrid	1	0	„
Duncan's Green-flesh do. improved ..	1	0	„
Hampton-court Green-flesh	1	0	„
Egyptian do. do. improved ..	1	0	„

FIRST PRIZE CUCUMBERS.

Victory of Bath	2	0	„
Gordon's White Spine	1	6	„
Lord Kenyon's Favourite	2	6	„

A packet of each of the three varieties, 5*s.*; if preferred, also a packet of Bromham-hall Melon will be included with the three Cucumbers for 7*s.*

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 16, Pulteney-bridge, Bath. A remittance must accompany the order, either in cash or penny postage stamps.

RHODODENDRONS AND AMERICAN PLANTS. —An unlimited supply always on sale, at the low scale of prices quoted, delivered in London, if ordered in quantity, free of carriage.

RHODODENDRON PONTICUM, 2 to 6 inches, 20*s.*, 40*s.*, and 80*s.* per 1000; 1 foot, single stems, fit for working, 10*s.* per 100; 1½ to 2 feet, very fine, fit for planting out for cover, 20*s.* to 40*s.* per 100; 4 to 6 feet, single stems, adapted for working the beautiful new scarlet and other rare species, 50*s.* per 100.

SCARLET RHODODENDRONS, of the finest varieties, 18*s.* per doz., on their own roots.

WHITE RHODODENDRONS, 18*s.* per doz.

KALMIA LATIFOLIA, 6 to 9 inches, 25*s.* per 100; 1½ to 2 feet, blooming, 12*s.* per doz.

Dwarf ROSE Stocks, fit for working, 8*s.* per 100.

Single CAMELLIA Stocks, fit for working, 42*s.* to 50*s.* p. 100.

PINUS (Abies) Douglasii (from seed), 10*l.* per 100, 30*s.* per doz.

ARBUTUS, 12 to 15 inches, fine, 25*s.* per 100; 6 inches, 8*s.* per 100.

LAURESTINE, two sorts, 8*s.* per 100, bedded, 1 foot.

TREE ROSES of the most esteemed kinds, 12*s.* to 18*s.* p. doz.

A large and fine Stock of the true "Durmast" English OAK, transplanted, 3 to 5 feet, 40*s.* to 60*s.* per 1000. With every description of Fruit and Ornamental Trees.—For Catalogues and prices apply to W. ROGERS, Nurseryman and Contracting Planter, Red Lodge, near Southampton.

RICHARD SMITH begs to call attention to the following New and desirable Plants, which will be sent out by him early in April.

PETUNIA ECLIPSE.—This is a very beautiful variety, which will give general satisfaction. The flower is large and of good texture; ground colour pale rosy flesh, very fully marked with rich crimson maroon veins, forming in their density and peculiar shape a perfect star in the centre of the flower; it is a free bloomer, of good habit, and unquestionably the most beautiful light variety hitherto sent out.

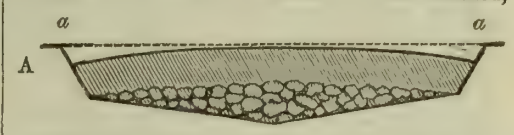
CACTUS (EPIPHYLLUM) MAXIMUS.—This is a hybrid, of enormous size, between Speciosissimus and Ackermanni major, of a bright deep red colour, slightly tinged with purple in the centre; it is very showy, an opinion of which may be formed when it is mentioned that the flower when expanded measures 10 inches across. See Notice to Correspondent "S.," *Gardeners' Chronicle* of July 5th, page 460.

Price of Petunia and Cactus, 5*s.* each. Where three or more are ordered of either or both they will be charged 3*s.* 6*d.* each.

Nurseries, Worcester, March 16.

HORTICULTURAL SOCIETY OF LONDON.—The EXHIBITIONS OF FLOWERS, &c., in the Society's Garden, will take place on the following SATURDAYS, viz.: May 18, June 8, and July 13. TUESDAY, April 23, *is the last day* on which privileged tickets, at 3*s.* 6*d.* each, are issued to Fellows of the Society, Every Fellow is entitled to 24 such tickets, if paid for on or before that day.—21, Regent-street.

The Gardeners' Chronicle.



SATURDAY, MARCH 16, 1850.

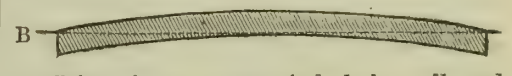
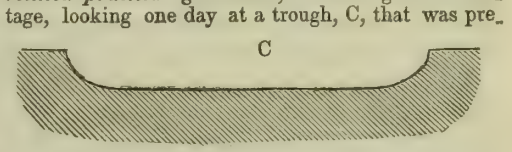
THE remarks of Mr. BAILEY (see p. 148), upon WALK-MAKING, excellent as they are, will probably not meet with universal approbation; for they are opposed to long and vicious practice and to deeply-rooted prejudices. He objects to the use of rounded pebbles, that is to say of coarse gravel, as a foundation for a walk; yet it is the usual custom to employ them. He says that "thousands of tons of stone are yearly thrown into deep trenches, to form, as it is supposed, the foundations for roads and walks, while at the same time they, instead of supporting them, secure the most effectual means of making them unstable and rotten." Nothing can be more true, nothing more just, and nothing can, at the same time, be more directly opposed to the opinion of half the walk makers in the kingdom. It is true that the worst gravel walks are made at the largest expense, and unfortunately it is also true that those who have made them are the loudest in proclaiming their efficiency. If you point to such walks in wet weather, when they are mere troughs of mud, the answer is "yes, that's very well, but see what capital walks they are when it is dry."

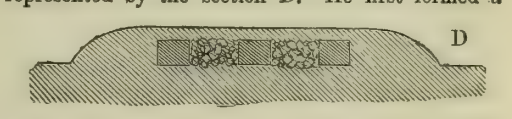


The old receipt for making walks was something of this sort. "Scoop out a trench to any depth you please, not less than a foot; if 18 inches deep so much the better. Make it hollow at the bottom. Fill it half full of coarse gravel; then fill it up to within 4 inches of the top with fine gravel; cover the whole with a layer of binding gravel; roll well, and leave it to settle till wanted." When finished,

a walk of this kind was what is represented at A. Rain, when it falls upon it, reaches the edges at *a a*, and then settles back towards the middle till the whole mass becomes soft; the round gravel at the bottom begins to slip, the fine gravel above slides down into the interstices, water rises through the mass, the surface subsides, water oozes up, footsteps puddle it, and the first person who passes over it renders it impassable for those who follow. This is no exaggeration of what occurs in walks, the merits of which are most loudly asserted by those who have made them.



The true principle of making gravel walks is to render it difficult for them to become wet. In order to effect this, they must not only throw off rain as fast as it falls, but they must be so contrived as not to receive it back again laterally. The first condition is usually satisfied by a case of hard binding gravel, which absorbs water slowly, and acts as a rude cement; the second condition is what is generally forgotten, and what renders all other precautions useless.



There are two ways of preventing the lateral ingress of water after sudden rain; namely, by side drains expressly constructed to remove rain rapidly, and by raising the walk so far above the surrounding borders that they can receive the water and carry it off by mere soakage. The first is the best, but is very expensive; the latter, B, although not always

so efficient, is very economical, looks well, and answers the purpose in most cases. In porous soils it is quite sufficient, and so it is on heavy land, provided some additional precautions, rendered necessary by the nature of such soil, can be taken.

A friend of ours who lives upon a soapy clay of the most undrainable kind, and who had spent much money in walk-making, under the advice of *experienced practical* gentlemen, without great advantage, looking one day at a trough, C, that was prepared for a new walk, thought that, when he constructed another, he would dispense with advice, and follow his own unpractical judgment. As advice seemed to be, and indeed had proved to be, the reverse of satisfactory, he resolved to make his next walk the exact reverse of what was so unsatisfactory; by changing a concavity into a convexity of equal amount, and by placing drainage above ground, instead of under ground. The result was what is represented by the section D. He first formed a

slight convexity, by throwing upon the intended walk some of the clay on each side. He then placed upon the surface, in three parallel lines, pieces of brick separated by intervals of a few inches. These intervals were filled with coarse cinder-siftings. The sides were built up with clay, falling gradually away towards the border itself, and over the whole was thrown a mixture of road-sand and fine cinders, or breeze, procured in a neighbouring brick-field. When finished, the centre of the walk was about 8 inches above the surrounding land. Success was complete, for these walks have proved to be so dry in the wettest weather, that they can at all times be walked upon with comfort. In this experiment broken bricks were used for the centre, because the owner happened to have them, and it was necessary to employ some material hard enough to prevent the surface of the walk from wearing away, and becoming hollow in the middle. Coarse gravel mixed with clay and water, and applied in the form of grout or concrete, would possibly have done as well. Cinder siftings were introduced between the bricks in order to secure the immediate removal of rain in the centre of the walk, there being no hard binding material at hand, and bricks themselves

forming with clay a surface through which rain would pass with much difficulty.

We do not mention this case as a model of walk making, but as an illustration of the principles which should guide us. It secured the immediate removal of rain from the surface as fast as it fell, and rendered it impossible that it should by degrees collect. That is the real object to attain, and provided it be attained, it is immaterial by what means. Those who study economy will probably agree with us that the cheapest method is the best. This indeed is the only point in which we differ from Mr. Bailey. He says that "Walk making, if well done, is very expensive; of course varying with the facility of obtaining fit materials; so much depends on their proximity to the scene of operations, or having to be carted from a distance; so that perhaps no two places would come under the same estimate." We, on the other hand, believe that in most cases the best walks are the least expensive, and that a perfectly sound walk may in many cases be made at no greater cost than a little labour, and some hardening or other material which will prevent the surface from becoming sticky. As to the tons of gravel that are employed in this operation, there can be no doubt that the greater part is mere waste.

The stove constructed by Mr. Dillwyn Llewellyn, to which we referred last week as an example of the possibility of introducing tasteful and natural arrangements in plant houses, was described in the Journal of the Horticultural Society some years since.

From a pond, at a level higher than that of the stove, a pipe was carried into a boiler, and thence conducted to the top of a mass of rockwork, as is represented in the accompanying cut. "Thence," says Mr. Llewellyn, "it pours a constant supply of water over three projecting irregular steps of rough stone, each of which catches the falling stream, dividing it into many smaller rills and increasing the quantity of misty spray. At the bottom the whole of the water is received into the pool which occupies the centre of the floor of the stove, where it widens out into an aquarium ornamented with a little island overgrown like the rock-work with Orchids, Ferns, and Lycopods."

By this simple means the first element demanded in a house intended for the imitation of a little tropical forest scene, was simply and effectually secured.

"The account," continues Mr. Llewellyn, "of the splendid vegetation which borders the cataracts of tropical rivers, as described by Schomburgk, gave me the first idea of trying this experiment. I read in the 'Sertum Orchidaceum' his graphic description of the falls of the Berbice and Essequibo, on the occasion of his first discovery of Huntleya violacea. I was delighted with the beautiful picture which his words convey, and thought that it might be better represented than is usual in the stoves of this country.

"With this view I began to work, and added the rock-work which I describe to a house already in use for the cultivation of Orchideous plants. I found no difficulty in re-arranging it for its new design, and after a trial now of about two years can say that it has entirely answered the ends I had in view.

"The moist stones were speedily covered with a thick carpet of seedling Ferns, and the creeping stems of tropical Lycopods, among the fronds of which many species of Orchids delighted to root themselves.

"Huntleya violacea was one of the first epiphytes that I planted, and it flowered and throve in its new situation, as I hoped and expected. The East Indian genera, however, of Vanda, Saccolabium, Aerides, and other caulescent sorts, similar in habit and growth, were the most vigorous of all, and many of these in a very short time only required the use of the pruning-knife to prevent their overgrowing smaller and more delicate species.

"Plants that are grown in this manner have a wild luxuriance about them that is unknown to the specimens cultivated in the ordinary manner, and to myself they are exceedingly attractive, more resembling what one fancies them in their native forests—true air-plants, depending for their subsistence on the humid atmosphere alone.

"Different species thus intermingle together in a beautiful confusion—Dendrobium, and Camarotis, and Renanthera, side by side, with wreaths of flowers and leaves interlacing one another, and sending their long roots to drink from the mist of the fall, or even from the water of the pool below.

"Many species are cultivated upon the rocks themselves, others upon blocks of wood, or baskets suspended from the roof, and thus sufficient room is secured for a great number of plants. At the same time the general effect is beautiful, and the constant humidity kept up by the stream of falling water suits the constitution of many species in a degree that might be expected from a consideration of their native habits; and I would strongly recommend the adoption of this or some similar plan to all who have the means of diverting a stream of water from a level higher than the top of their stove."

It may be alleged that this experiment was conducted under peculiarly favourable circumstances. The head of water was at hand, and the rock-work was readily formed from the sandstone of the country. But a little ingenuity would provide an ample supply of water anywhere; for no great quantity is really required, and warmed water is always useful in gardening for other purposes besides making an artificial cascade. As to real rock being indispensable, in the first place, railways or trading vessels can generally bring it for an inconsiderable expense; or half-burnt bricks consolidated into masses with Roman cement, or the artificial stone now so common, might be employed with equal advantage; the only real difficulty is, to find the taste required to put such materials together skilfully.

Mr. C. Warner has contrived a similar house at Hoddesdon, in which we understand that the difficulty of combining horticultural convenience and graceful arrangement has been happily overcome. At one end of his house there is a small piece of water surrounded by rock-work, on which he grows some of the larger Ferns—Tillandsias, Lycopods, Æschynanths, small Palms, with the Bamboo, &c. Here parts of the wall are becoming covered with climbing Ferns; on the pillars supporting the roof various Orchids are growing, along with Lycopods. We hope to give a more particular account of this house on a future occasion.

The real inconvenience of managing houses thus constructed consists in the difficulty of dealing with the swarms of insects which secrete themselves by day in the crevices of stones, and sally forth at night in search of food. When Orchid-growing was in infancy we witnessed an experiment like that of Mr. Warner's, which totally failed from this cause. The plants introduced into the house had a charming appearance at first. Everything that before was yellow became green, and plants which had been torpid for months threw out in abundance their green delicate roots into the warm damp air. But alas! in a few weeks every root was devoured, the plants again sickened, and the insects being inexpugnable, the place was pulled down again.

The only mode of dealing with this obstacle is by utterly destroying all insects and their eggs before plants are introduced into such a house. All earth should be roasted, or burnt; all turf should be baked; all Moss, all pots, baskets, willow-work, logs of wood, should be boiled; every plant should be washed perfectly clean, doubtful pieces being cut out, and then plunged in warm water for a few hours before it is permitted to enter the house. If doubts exist of a plant being clean, it should be put into hospital, and watched till the certainty is acquired that no insects are there. The roasting, burning, baking, and boiling, together with washing and steeping in warm water, costs little trouble, does no harm to the substances acted upon, but, on the contrary so much improves their quality that even in other places than such as are now described it should always be practised when the necessary means exist.

We refrain from pointing out in detail what plants are best suited for cultivation in these miniature forest scenes. Everyone can determine that, according to his taste and means. We would only observe that unusual forms of foliage, a plentiful mixture of pointed with rounded figures, creeping and climbing plants with those which grow erect, and party-coloured or velvety leaves contrasting with the pale, the shining, or the whole coloured, will produce the best effect. Ferns of all sorts, Tillandsias, Pitcairnias, Marantas, Caladiums, small Palms, Dwarf Bamboos, Side-saddle Plants, Pitcher Plants, trailing Endogens with coloured leaves, stiff leaves like sword blades, and similar things, will readily present themselves to all who seek for materials.

We have only to add that when houses of this kind are to be kept continually gay, it is absolutely necessary that an auxiliary house should be provided, in which various plants can be placed while at rest, and when their beauty has necessarily departed for a season.

DISEASES OF PLANTS.

(*Continued from p.* 149.)

Genus XX. Hæmorrhage; *that is, flow of a lymphatic juice from some part of the plant.*—This disease is very nearly allied to the ulcer, and might be reckoned among the species of the latter, but that its chief symptom lies in the flow of the juice, and not in the solution of continuity, which is always very slight. Two species may be distinguished.

First species. Ordinary Hæmorrhage.—Some gummy plant, like the *Penæa sarcocolla*, abound in sap, which burst through the vessels of the bark, and issues drop by drop. In most cases no mischief is produced by it, but if the flow of this gum resin is inordinately great, it will cause too much laceration, and, preventing the wound from properly healing, generally affect the plant. In some countries these hæmorrhages are produced intentionally; thus, in America, they bore the Sugar Maple, a tree which might be advantageously cultivated by us in Italy, in order to extract a liquor which is drank. But when the flow is too great the tree suffers, or even perishes. Excessive vigour of growth being the cause of this distillation of gummy fluids, it follows that a proper diet is the means to be resorted to to prevent it.

Second species. Injurious Hæmorrhage. — This disease very frequently affects trees growing in low swampy situations, and is often confounded, as I have observed, with the ulcer. The sap becomes corrupted and somewhat acrid, but without staying to corrode the substance of the plant, opens itself a passage through it. Plenck says there is no remedy for the disease. I have myself had no opportunity of treating it, but I imagine that if taken from the commencement it might be stopped, by opening out an incision to the seat of the disease, cutting out the affected parts, and stopping up the wound with Forsyth's cement. It is true this may not suffice where the primary cause of the evil is the inundated state of the soil the tree grows in; in such case nothing can be done till the water is first drained off. I have observed, in places where the trees have

been affected with hæmorrhage, that they were generally growing in stagnant water. Perhaps running water would not produce the same mischief..

Genus XXI.; *one species.* Faintness (*Deliquio. Defaillaure*, a word of more extended meaning than ours.)—Plenck understands by faintness of vegetables, a feeble connexion between the leaves or flowers and their stalks. I would rather define it to be that state of the plant which impedes the exercise of any of those functions which have an appearance of animal life, such as irritability. This may be caused by excessive stimulus, or by the want of it. Instances may be observed in the Mimosa pudica, or Sensitive Plant.

In the great heat of summer, under a mid-day sun, this plant folds its leaflets and becomes insensible, or at most a strong shock will affect the youngest leaves which may not have been closed. A strong hot wind will have the same result. The plant will not then show the usual phenomenon. So also if the plant is much electrified, and in the contrary case if the atmosphere becomes very cold, or rain falls, the irritability will be equally lost. But there is a difference observable in the two cases. When the irritability is lost by excess of stimulus, it is immediately recovered as soon as the plant is in the atmosphere that suits it; but when the effect is produced by any considerable diminution of stimulus, it is with great difficulty that the former vigour is restored. My own observations have confirmed this, and shown that a slight degree of cold is enough to destroy entirely the irritability of vegetables.

The phenomenon called by Linnæus the sleep of plants is well known. Many of our field plants, such as Saintfoin, Beans, Clover, Vetches, &c., afford very good examples to the agriculturist. Open in the day-time, the approach of evening, a high wind, or even the ardent mid-day rays of the sun, will cause them to contract their foliage, folding down their leaflets on the footstalk or stem. But from the moment that a sudden cold causes their vegetation to languish, they no longer exhibit these contractions. The same thing happens with exotics preserved in plant houses from the rigour of our winters. Their weakened vegetation deprives them of irritability. The organs of generation are well known to lose it the most readily, and never to recover it.

The observation of this disease, carried on with great care, through a long course of seasons, might throw some additional light on the question of vegetable irritability, which has been the subject of so much discussion as to whether it has in reality any analogy with animal life. On this point I cannot refrain from quoting the following passage from Sennebier's Vegetable Physiology. "If by irritability," he says, "we are to understand the faculty of being affected by the contact of external bodies, it is to be found in all organised beings. But if we mean by it the will which commands muscular action, the analogy subsists no longer. The fibres of plants are capable of extension and contraction, but they are strongly combined together, and are not merely connected as animal fibres are by a soft and flexible cellular tissue; thus the muscles are flexible whilst the vegetable fibre is rigid." The excellent observations of Mirbel have not yet enabled us to come to any conclusion as to vegetable sensibility, which has been supposed to bear some analogy to that of animals. (Here follow seven or eight pages of general observations on the cure of the diseases enumerated in these three first classes. These relate chiefly to the manner of changing the soil of plants, draining, and manuring—mostly repetitions of what has been said already, and containing nothing worth translation.)

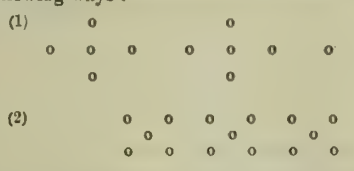
Class IV. Mechanical injuries (*Lesions*).—Under this name must be understood not only injuries caused by a mechanical violence wounding the whole or part of that plant, but also any mechanical force or pressure which impedes its development, or prevents the full and ready performance of its functions. Diseases of this class, on account of their frequent occurrence, require careful attention on the part of cultivators.

THE BEE KEEPER.

It is of great moment, at this season, to feed any stocks that do not feel weighty to the hand. The best artificial food is made of 6 lbs. of *best Jamaica* sugar, 3 pints of sweet ale, and about a tablespoonful of salt; these should be well boiled up; when cold, add 2 oz. of rum, or 4 oz. of sherry, and keep in bottles.

The proper time for feeding is just after dark, and what is not consumed should be removed very early the next morning; this should be repeated every night as long as the bees remove or consume it, which will be till about the end of April. If you have the improved cottage or other hives, with a board and glass at the top, then you may let the tin feeders remain on the hives, and only replenish them as you find necessary; also taking care to do this after dark. This precaution is necessary, as otherwise you entice the bees of the other stocks to invade the weaker ones you are feeding, which generally ends in the destruction of the weaker and considerable loss to the stronger ones. The attempting to feed bees in common straw hives by a trough put in at the entrance is generally worse than useless, unless with great vigilance in removing the troughs, and what is not consumed, by or before daylight the next morning.

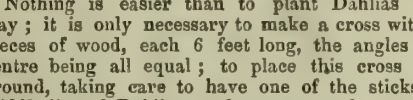
Tin feeders are generally made with a float of wood perforated with holes; these have the disadvantage that the bees get under the float, and are drowned. It is better to fit the tin with a piece of empty honey-comb, and then pour the food over it, which sinks into the cells; the bees are then able, by walking on the edges of the cells, to obtain the food without the chance of smearing themselves.



It is also proper to keep a constant supply of salt (about a teaspoonful dissolved in about a pint of water), within reach. Garden-pot pans filled with clean pebbles, and the solution poured among them, so that the stones form resting places for the bees to drink from, and placed a few yards from the hives, form a good mode of offering it to them. These pans should be constantly replenished with a fresh solution of salt till about the end of May. *Y.*

CHEVREUL'S SCHEMES OF FLOWERS FOR SEPTEMBER.

The month of September is the best in the year for obtaining beautiful arrangements of flowers. The numerous varieties of Dahlia, which are in perfection this month, enable gardeners to ornament large pieces of ground with different varieties of one species of plant, presenting every colour except blue. The arrangement of Dahlias seems to have pre-eminently occupied M. Chevreul's attention, and he recommends the following sequences:



A. *For Lines of Dahlias.*—1. White, scarlet, white, lilac-rose, yellow, violet or purple, orange, white, scarlet, white, &c. 2. White, scarlet, dark purple, lilac-rose, yellow, violet or purple, orange, white, scarlet, dark purple, &c. 3. White, scarlet, dark purple, lilac-rose, white, yellow, violet or purple, orange, white, scarlet, dark purple, &c. In these lines the Dahlias should be about a yard the one from the other.

B. *For Groups of Dahlias.*—Dahlias may be arranged in groups of five or seven; each group of five should be a quincunx, and each quincunx should be placed with regard to its neighbour in one of the two following ways:

There being in either case three parallel rows of Dahlias, with the plants in each row equidistant from each other.

The arrangement of seven is also composed of three parallel lines, the plants in the middle line being equidistant from each other, thus—

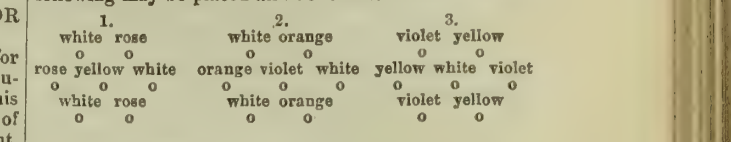
Nothing is easier than to plant Dahlias in this way; it is only necessary to make a cross with three pieces of wood, each 6 feet long, the angles at the centre being all equal; to place this cross on the ground, taking care to have one of the sticks in the middle line of Dahlias, and to put a stake at each end of every stick and a stake in the middle; the cross is then shifted to the place in which the second group is to be, that is to say until the centre of the cross is three yards from the centre of the first group, and one of the pieces forming the cross coincides with the middle row of Dahlias as before.

To avoid any mistake in planting the groups, it is as well to make a plan of them on a piece of paper with wafers, the colours of which are as nearly as possible the same as those of the Dahlias which are to be employed. Then at the bottom of each stake plant a root of a Dahlia of the proper colour. If a group of seven Dahlias consists of six plants of the same variety, one root should if possible be divided into six parts, so that all the six plants may be as nearly alike as possible. If the root is too small to be divided into six equal parts, it is better to divide it into three parts only, and to alternate them with some other sorts. This precaution should be taken whenever complete symmetry is desired.

Groups of seven Dahlias, the six outside ones being exactly similar.—1, six orange, with a purple or violet centre; 2, six purple or violet, with a yellow centre; 3, six yellow, with a purple or violet centre; 4, six scarlet, with a white centre; 5, six white, with a scarlet centre; 6, six rose-coloured, with a white centre; 7, six purple or greenish black, with an orange centre.

If the above arrangement occurs in a straight border whose centre corresponds with a principal point of sight, the 7th group should be placed in the middle, and to the right of it the groups should be placed in the following order, starting from No. 7, 6, 5, 4, 3, 2, 1, supposing the border to hold only 13 groups; if it will hold 15 a white group should be placed at each end.

If the border is circular and there is no central point of sight after No. 7, begin by 1, 2, 3, 4, 5, 6, 7 and so on.



The following are different groups symmetrically arranged:—I. 1, six purple or violet, with a yellow centre; 2, six orange, with a white or very dark purple centre; 3, six white, with a scarlet centre; 4, six orange with a white or very dark purple centre; 5, six purple or violet, with a yellow centre. II. 1, six yellow, with a purple or violet centre; 2, six lilac, with a white or yellow centre; 3, six white, with a scarlet centre; 4, six lilac, with a white or yellow centre; 5, six yellow, with a purple or violet centre. III. 1, six very dark purple, with a yellow centre; 2, six scarlet, with a white centre; 3, six white, with a scarlet centre; 4, six scarlet, with a white centre; 5, six very dark purple, with a yellow centre.

In a straight border capable of containing more than five groups, any one of the three preceding arrangements I., II., or III. may be taken with the following additions:

If the border can hold seven groups it is best to end arrangement I. with two white or yellow groups; arrangement II. with two white or violet groups; and arrangement III. with two white or yellow groups.

The arrangement I. may be followed by arrangement II., and that by arrangement III.

If the Dahlias are not to be seen from a considerable distance, and it is not necessary that the arrangements above described should be viewed very distinctly, the following may be placed all in one line.

If nine groups are required, after No. 5 add groups 4, 3, 2, and 1. If there is room for 11 groups, group 5 should be placed at each end of the arrangement for 9.

C. *Basket of Dahlias.*—The only observation required here is that all the individuals of the same variety should be placed symmetrically, and that the precautions before given for the purpose of ensuring symmetry should be attended to.

In September a line of common Laurels, and of Pyracanthas with their red berries, looks well. Privets, with their blackish-blue fruit, contrast equally well with the Pyracantha or with Holly.

CELERY.

The varieties of Celery may be divided into two classes:

A. White Solid.

B. Red Solid.

The Celery with hollow stalks, formerly known as the Common Red and Common White, is now considered unworthy of notice, and ought to be excluded from cultivation.

A. White Solid.

White Solid, alias Fine White Solid, Celeri Turc, Celeri plein blanc. Of strong and rather tall growth, blanches readily and comes into use earlier than the Red Solid varieties.

1. *Seymour's Superb White*, an excellent variety of the preceding. Stalks broad, flat at the base, closely overlapping and forming a compact, well-blanched, crisp heart, with ordinary care. Tips of the serratures pale.

Italian, alias Italian Upright, Upright, Large Upright, Giant, Patagonian. Tall, strong, erect, deeply furrowed, not so crisp as the preceding.

Wall's White is an improved variety of the Italian, which is esteemed by the growers of Celery for competition.

Curled White, alias Nain frisé. Leaves much curled, resembling Parsley, and like those of the latter might be employed for garnishing; it is dwarf, hardy, and crisp, but not fine flavoured.

2. *Early Dwarf Solid White*, alias Court hâtif, Celeri Turc, of some. Dwarf, but very solid, and forms a compact heart; excellent for early use.

B. Red Solid.

3. *Red Solid*, alias New Large Red, New Large Purple, New Russian, Cole's Red, Cole's Superb Solid Red, Striped Solid, Violet de Tours, Gros Violet de Tours. Dark Red or purplish, but the completely blanched portion is very pure, crisp, and of excellent flavour; the best red Celery. The *Manchester Red* is scarcely different, and may be considered the same variety, excepting that it has acquired a stronger habit and rounder stalks. *Shepherd's Red* is now preferred to the Manchester Red by the prize growers, because it has flatter stems, and consequently blanches better.

The sorts considered of best quality have numbers prefixed.

Celeriac, or *Turnip-rooted Celery.*

This is a sort of Celery which forms a knob at the root under favourable circumstances. It is much esteemed on the Continent, where its cultivation is well attended to; the roots are taken up and stored out of the reach of frost, usually so severe as to destroy other kinds of Celery. It is also called Knob Celery, Knoll Celery, Celeri Rave, Celeri Navet. There is a sub-variety veined with red; and another with curled leaves, or Celeri Rave à feuilles frisées. *R. T.*

VILLA AND SUBURBAN GARDENING.

Having secured perfect drainage, the next point to draw attention to is the condition of the soil to be used in potting. It is of importance that the latter should be in proper order; for potting with soil either in a wet or perfectly dry state is for obvious reasons to be avoided. If soil too wet is pressed into the pot, the plant, even if a free-growing kind, will very rarely succeed. The moisture renders the compost so compact when the latter is pressed, that it takes a long time to dry; it even not unfrequently becomes sour, and the young roots perish; under such conditions too the roots are entirely cut off from air, and no plant will remain long in health when that is

the case. It is necessary therefore to guard against such a state of things, by having at command, and in a mellow-working condition, a portion of all the kinds of soils that are likely to be required. Those who have open sheds to protect their compost from rains should avail themselves of them; but those who have no such accommodation must resort to other expedients for keeping their soil dry. A few rods, with a piece of asphalte fastened over them, will throw off water; or even a few large slates, which can be moved at pleasure, will effect the same purpose. As potting is required to be done at all seasons, and in all kinds of weather, the absolute necessity of having soil in a condition fit for immediate use must be obvious.

It has been a matter of some dispute as to whether soil for potting should be used in a rough, half unbroken state, or in a perfectly reduced condition. In my opinion this will depend on the character of the plant to be potted, as well as upon the texture and constitution of the soil employed. If the latter is naturally of a free, turfy kind, it may be used in a pretty rough state, but if the contrary, it must be well broken up, and a portion of sand added to it, in order that roots, water, and air may pass freely through all its parts; for on this the well-being of all plants depends in a very material degree. As regards potting, no plant ought to be placed deeper when repotted than it was in the smaller pot; but a slight portion of the surface soil may be carefully removed, to make room for about half an inch of fresh material. This not only improves the appearance of the plant, but also acts as a dressing to it. It is sometimes injudicious to disturb the old ball much; but in most cases the roots may be slightly relieved, so as to give them a better chance of striking at once into the new soil; the previous drainage ought also to be carefully removed. *Pharo.*

Home Correspondence.

Gravel Walks.—In your article on gravel walks, you put the question, I think, too generally; and, besides, do not give Nos. 1 and 2 fair play, as there are two questions—Whether the convexity should be above the adjoining ground or not? and, Whether there should or not be a substratum of stones? The object of the convexity is to prevent rain from penetrating, and for that purpose cause it to run off as quickly as possible. It cannot do so unless either the convexity is above the adjoining sides, so that the water may run on to the adjoining soil, or there are every here and there drains along the sides to carry it off; or the adjoining soil is porous enough to carry it off without. Again, no gravel, however binding, is perfectly waterproof, and some wet will, in long continued wet weather, soak through; and the most essential point is, that that wet should be as quickly carried off as possible. In some soils the porousness of the soil itself will be sufficient; but not in clayey soils, unless there be a substratum of coarse materials in the form of No. 1 or No. 2 (both of which are equally good), with proper drains for carrying it off. The result is, as far as my experience goes—and it is the only part of gardening in which I have any experience—that in light porous soils, where good binding gravel is to be had, No. 3 is the best; but in our soil and bad gravel it will not hold at all. The wet that soaks through the gravel is retained as in a trough by the clayey soil, and the whole mass of gravel gradually sinks into the clay. Whether there be an understratum or not, wherever the edges of the convex surface are below the adjoining soil, there must in stiff soils be surface drains on the sides. *M.*

Descent of the Sap.—This seems to be a question upon which practical men very widely differ; without, therefore, entering into the *pros* and *cons* of the subject, I shall give the particulars and results of some experiments made by me on Vines—in the first place, to test the fact of the sap's descent, and in the second place, to ascertain the possibility of buds attracting sap from distant parts of the same plant; and, having stated these, I shall leave your readers to draw their own conclusions. In my first experiment I removed a circle of bark off a main branch of a Vine, half an inch broad, scraping every particle of the thin bark off the alburnum; this circle is only one inch from the fork or junction with another main branch, so that the descending sap (if there were a circulation) could easily find its way up that very short distance, to effect the annular deposit; but while the lip above the circle now measures 6 inches in circumference, the lip below it measures only 4¼ inches in circumference; thus we find the annular deposits exclusively above the circle—none whatever below it. In my second experiment, I cut clear off all the swelling buds but two from a young shoot at the bottom or base, from whence a second young shoot also proceeded, the buds of which I also cut clean off; these two buds had each three young leaves, consequently they were able to exercise all the influence of swelling buds, such as attracting sap from above their position. I then cut one shoot to within 2½ inches of these two twin buds, and the other shoot within 6½ inches of the same buds, and these shoots, be it observed, were trained at an angle of 45°, so that the force of gravity would be in favour of the bud's influence. Well, the result was that each shoot kept "drop, drop, dropping," not for a few hours of one day, but for eight successive days; in fact, until bleeding gradually ceased in the usual way. Do these experiments and their results bear in any way upon the question of the sap's descent or the influence of "buds commanding the sap" in Vines? *J. C. Humphreys, Cork Abbey, March* 10.

Pond Mud.—In reply to "Ruris Amator," I beg to state that I conceive it possible to make his "mud" a desirable addition to his "poor sands," by the addition of about 20 per cent. of lime and salt, in equal quantities. Of course the "mud" must be previously drained comparatively dry, and then well mixed with the salt and lime. Another correspondent refers this week to his pond as containing another kind of mud, which can be of no value except on "heavy clays." His difficulty appears in choosing the best method of removal. It occurs to me that he had better scoop it in one or more "lifts" into a trough, which could be made to lead to any necessary distance, or into a cart having the joints well "plastered" or "luted" with clay. As this mud, or rather "silt," is "all alive," the scooper, troughs, &c., may remain in the same position to the end of the job. Much of this trouble may be obviated by sinking a "catch pit," rather longer than wide, and shallow, with its length in the direction of the stream, and so close to it that its channel could be readily diverted into or rather through this pit, where the "silt" would have the opportunity of falling to the bottom instead of being carried on into the pond. Of course this shallow pond or pit could be easily emptied as soon as it gets full of "silt." *W. E. Gill, Truro, March* 12.

Disease in the Roots of Forced Strawberries.—I am forcing about 1000 pots of Strawberries, which were plunged in the open ground (gravelly bottom) during autumn and winter. In the beginning of February some were put in a Vinery upon a back shelf close to the glass; the rest were introduced three weeks later. They have had every attention paid them, and to the eye they look pretty well; but when they are turned out of the pots their roots are found to be decaying, mildewed, and to smell very mouldy. I have never seen or heard of any disease of the kind before, nor has my foreman—a man of long practice. It commences on the young roots in the form of small black spots, which soon spread and destroy them. We are quite at a loss to account for the evil, and can only attribute it to the soil in which the plants were potted, which consisted of rich light garden mould, mixed with some stiff loam or clay, the raised bank of an old hedge, which was turned over several times and exposed to the weather some months before using. I send some pieces of the roots for inspection, and shall be glad of your opinion on the subject. *Constant Reader, Deptford.* [These roots are dead and have a musty smell; that is all that we perceive.]

Amount of Rain which has fallen during these last five years at Bognor, Sussex.

	1845.	1846.	1847.	1848.	1849.

It is perhaps worthy of mention that this place is within 250 yards of the sea, and that this part of Sussex is very level, being about 10 miles from the Downs. *James Graham, Bersted Lodge, Bognor.*

Rats: their Destruction by Phosphorus easy and certain.—Having already detailed at some considerable length, in your Paper of Feb. 9, the success—I may say the complete success—of my experiments in the destruction of a colony of rats by the use of carbonate of barytes, I will now, according to promise, tell you how to handle with unfailing effect, under certain circumstances, another fatal weapon—phosphorus. I publish this at once, and through the medium of your columns, for a most particular reason. Very considerable attention has been directed to the subject, by the quotation in nearly every paper in the kingdom of my two several contributions to the *Gardeners' Chronicle* of Jan. 12 and Feb. 9. This has brought me such a multitude of letters, every successive post adding to their number, and has involved me in consequence in so extensive and serious a correspondence, that I positively begin to despair of ever again being *in equilibrio.* I can only hope for repose by seeking the aid of the press, whose power of extending information I can, alas! but too feelingly vouch for; and which power I trust to their generosity again to accord me, seeing the peculiar "fix" in which I am placed. Their timely assistance will prevent the necessity for providing myself with an amanuensis, *Mais, revenons à nos Rats!* The phosphoric compound is as follows. I have purposely divided the materials into small quantities. According to the number of the enemy to be vanquished they must be lessened or increased. Procure of lard or dripping a quarter of a pound, of phosphorus 1 drachm, of spirit of wine 1 gill; place the whole of these in a pint wine bottle, thoroughly cleansed previous to use. This should be covered, up to its neck, or rather middle, with hot water, which may be managed by putting the bottle into a saucepan deep enough to hold it; and by gradually heating the water. When the lard or dripping is dissolved, remove the bottle from the water, cork it firmly, and shake it until the contents are thoroughly incorporated. When cool, pour off the spirit of wine. By this time, the "charm" will have nearly been "worked." Little more remains to be done. Procure some Wheaten flour, and having rubbed sugar into it, warm the contents of the "charmed" bottle, and pour sufficient from it to make the whole into a paste of ordinary consistence. Flavouring the above is the "seventh bullet," the master-piece. To this much attention must be paid. Get some oil of rhodium and some oil of aniseed, both powerful oils; and dividing your dough into two portions, "charm" the one half with rhodium, the other with aniseed. The quantity of oil requisite is very trifling. Having made up the paste into a number of small globular pieces (like marbles), place them carelessly wherever the rats abound, and the existence of the latter will soon become a mere "matter of history." I need only add, that when rats are running about, and revelling in an abundance of animal food, the barytes only must be used in conjunction with garbage, fish, the entrails of rabbits, poultry, &c. These, if untouched by the human hand, are subtle emissaries, and deal destruction right and left. Where, on the contrary, the rats have little to prey upon in the form of flesh, phosphorus, cooked as per receipt, will be esteemed a dainty luxury, worthy of our own Soyer, and they will sit down to it with the appetite of a London alderman. Would, for their sakes, that their digestion were equally good! I should be glad to have it in my power to *rat*-ify the fact. *William Kidd, Sanders' Cottage, New Road, Hammersmith, March* 13.

Diseased Apple-tree.—What had I better do with a young Apple-tree, the trunk of which has been pierced, as I suppose, by some insect immediately below the branches, where there are two or three small holes about the size of a common quill pen? My attention was first directed to it last autumn by seeing a glutinous reddish matter on the ground immediately under the tree, and casting my eyes upwards I observed a small hole in the trunk where this reddish matter was oozing out. I bound the wounded part over with tow dipped in oil; but on removing this bandage the other day, I observed that a fresh hole had been pierced immediately above the bandage, and that a dry dusty substance was escaping by this aperture. The tree notwithstanding is now opening its buds. *A Subscriber, Hackney.* [If the case was ours we would take off the bark, destroy the grub or insect whatever it may be, and then carefully replace the bark, binding it down and claying it over like a graft. The bark, if thrown into milk-warm water while this is doing, will take no harm, and will join the wood again in a short time.]

Glass Water Pipes.—Can any one inform me if glass pipes have been laid down for the conveyance of water anywhere with success; if so, by whom? and also the amount of pressure they will bear on the square inch. *N. E. A., Bath.*

Moths (see p. 152).—Mr. Westwood having stated in your last Number, on the authority of Mr. Curtis, that the Tortrix nigricana (not nigritana) of Haworth, is synonymous with the Endopisa pisana of Guenée, I beg to say that this is an error. Tortrix nigricana of Haworth is identical with Endopisa nebritana of Guenée. The larva of this species probably feeds upon the seeds of some Vicia or Lathyrus, the perfect insect being generally found where these plants grow. Endopisa pisana of Guenée is probably identical with the Tortrix proximana of Haworth; but as this can perhaps never be ascertained with certainty, it will be better to adopt Guenée's most appropriate name. The larva of this insect feeds upon the seeds of the common Pea, and in some seasons is very destructive. When full fed, it descends into the ground, forming a cocoon of small particles of earth, in which it remains till May of the following year, when it changes to a pupa, and the perfect insect appears in about three weeks. It is very similar to E. nebritata, but smaller, paler in colour, and has whiter palpi. Several other species probably occur in this country, feeding upon the seeds of various Tares. *Henry Doubleday, Epping.*

A word or two on the Qualifications of Gardeners.—As some discussion has lately arisen in your columns respecting gardeners being entitled to the term professional, may I beg your insertion of the following suggestions, as a mode whereby a line may be drawn between gardeners properly so called, and that large class of individuals embraced by the term, "gardener." I have no wish to undervalue the services of a body of men, a large portion of whom have many qualities in common with gardeners of a high grade, but would make education, as in other professions, the standard whereby to judge of a man's abilities. At present young men as gardeners obtain situations [more frequently through interest than merit, and stand their chance of succeeding afterwards, by trusting to expedients, which if gentlemen knew of them, would not be tolerated for a moment. I shall not allude to this more particularly now, but proceed to explain my plan, which would both protect gentlemen seeking gardeners, and the really deserving gardeners themselves. Here it is. All young men who have been educated as gardeners, and have undergone the usual training, to be examined by a board sitting sometimes in London, something in the way in which young men are examined in the Society's gardens, and (modified to suit the case) similar to that practised by the College of Surgeons or the Apothecaries' Company, the board to consist of an equal number of scientific and practical men. The examination to be carried through every branch of science connected with gardening, and through the detail of each practical operation. All persons passing this examination to the satisfaction of the board, and

whose moral character was good, to be furnished with a diploma, certifying as the case might be. An ordeal like this would soon separate so-called gardeners into two classes—a small select one, and, I imagine, a rather large class, who might either by industry mend their position, by presenting themselves again for examination, or occupy that position their abilities had made for them, as possibly useful men enough in their way, but certainly not entitled to be termed professional gardeners. *Obitur dictum.*

"*Maxima est veritas et prævalebit:*" *Britannia's Protest against Dry-rotten Timber, &c.*—I have long since retired from the public arena, which no more concerns me than the man in the moon, yet I still survive to boast of three score and three years full of "vanity and vexation;" and at this no uncommon age, I have survived nearly all the celebrated controversialists that once surrounded me like a hornet's nest; but, I thank God, I have outlived them sufficiently to see the ruinous and foolish system of our former navy boards undone by their successors in a great degree, against which I earnestly protested in 1823 and 1824, and though at several thousand pounds expense, without any good effect at that time, when the renowned Lord Melville, Admiral Dundas, Mr. Croker, Sir T. B. Martin, John Knowles, and Co. reigned over our dockyards. The Admiralty now purchase winter-felled or winter-hewn Oak timber at a premium of 12*l.* 10*s.* per cent. more than for Oak hewn in summer at bark harvest! This is exactly the object I pressed before Parliament by memorials to both houses ("a plague on both," as Shakspeare write. in 1823 and 1824, without any good effect then, which compelled me, as a simple patriot, at that time to publish a treatise on the "Origin, Nature, Effects, and Danger of the Dry-rot—Remedies, &c.," which proved the late John Knowles' treatise (then Secretary to the navy board) quite contradictory in itself and most delusive, by extracts from different pages, but which, although most important, are too voluminous for me to wade through all this naval mire again. The object of my present letter is to state that the public generally labour under Mr. John Knowles' delusion as to the Hawk, which that gentleman urged as conclusive proof against winter-hewn Oak. But the fact is, that ship was not built with Oak hewn in the winter, with the bark on (when the sap or the seed of dry rot has returned to the roots to renew the next year's growth), but with timber that was cut at bark harvests, as then usual (at Deptford in 1793), on one of her sides, and with experimental timber on the other side, that had been barked (while standing) three years before, and then felled in the winter; and when broken up in 1803 both sides appeared equally defective. And this was pronounced positive proof against winter-hewn Oak by Mr. Knowles, in defence of the system then practised, contrary to the old system of building our navy with Oak cut in winter with the bark on, for which former navy boards paid 7½ per cent. extra till 1792, I believe. All this was done as experiments in building the Hawk, though the very same thing had been attempted at Portsmouth docks and failed in 1718, according to Jacob Acworth's letter to Sir Isaac Townshend, then commissioner at that port, a copy of whose letter is before me, extracted in my treatise before mentioned. The Montague was the last ship of 74 guns built at Chatham with winter-hewn Oak with the bark on (between 1775 and 1779, when 7½ per cent. was paid as then equivalent to the bark), and she, instead of lasting 10 years, like the Hawk (and the present navy generally, on a fair average, as I verily believe), was not broken up till 1818, after all the war, and after 39 years' service or duration. There is no doubt upon these subjects. Why do the Admiralty now allow 12½ per cent., one-quarter extra, for timber hewn in the winter, with bark on, if not better than bark-harvest timber? To confirm all these facts, I must mention that King James, in 1603, made a law to build our navy with winter-hewn Oaks in the bark, which (strange to record) was repealed in 1808, when the utmost need existed for sound Oaks. Ships then lasted 40 years, instead of 10 now. I believe the expense of rebuilding the navy, miscalled repairs, is equal to the building expense. I remember John W. Croker pronounced me mad, for this cause, when he defended the system I always condemned; and now (if you will do us both the justice to insert this letter) let the survivors judge fairly between the three Johns, and let him who deserves the mad-cap always wear it properly, without such outrages and insults as he offered to me where I had no power to redress myself. Nothing but sentiments of common justice influence me in addressing this letter, as this is the proper season to hew Oaks for ship building, whose durability entirely depends on this whole practice. I never saw Mr. Croker nor Mr. Knowles (who is dead), and have no personal animosity against either, or any other man, but truth demands this *exposé*, and which (in the course of my life) has often placed me under anxieties and duties, which I trust I have always endeavoured to discharge, as every reasonable, sober, and honest man is bound to do, well knowing that all get their due rewards here or hereafter. P.S. I am glad to find the leather tax has been repealed, as I also recommended cheap substitutes for bark in the tanner's key. It is in consequence now manufactured in three months, instead of three years, under the old ignorant process; so that I now have double reason to find that my dear hard labours are at last crowned with double success, after an expenditure of above 5000*l.*, to my deep sorrow and loss, although I have certainly learnt to despise all human honour. This is written disinterestedly, as I have no books extant to sell now, and disdain all paltry, selfish, and worldly motives whatever, or I could give you plenty of strange and curious details, but I have compressed as much as possible in one sheet of paper. "Sic transit gloria mundi." *John Burridge.*

Societies.

Entomological, *Feb.* 4.—The President in the Chair. Mr. Weir exhibited a box of Micro-lepidoptera, illustrating his new method of arranging series of specimens of separate species on detached cork-boards, for facility of transposition in the cabinet. Mr. Douglas exhibited a new British Tortrix, allied to Stigmonota redimitana, which he proposed to name Weirana, after its captor, Mr. Weir; likewise specimens of Cosmopteryx pinicolella of Zeller, a species new to this country, found on Fir trees. Mr. Stephens exhibited specimens of Orthosia ruticilla of Esper, another new British species, from Yorkshire. Mr. S. Stevens exhibited a fine specimen of the extraordinary Australian Eurycantha horrida; also various new and beautiful Lepidoptera, from the neighbourhood of Para, collected by Mr. Bates; and a specimen of Lamia textor, which he had kept alive since last October. A paper was read by Mr. Stainton on the genus Micropteryx of Zeller. And a conversation ensued relative to the supposed injury done to Pears by the larvæ of Ditula angustiorana; several members concurring that there was but little ground for this opinion, as, except in the instance quoted by Mr. Curtis, the insect had not been observed to attack fruit trees, and, in fact, that it was seldom seen in gardens, although its larva was polyphagous; the perfect insect had also been found in the greatest abundance in the neighbourhood of Firs and Yews by Messrs. Stainton, Weir, and Douglas, and Mr. Shepherd had bred it from the buds of the Fir. Tortrix lævigana, on the other hand, was known to be very destructive to fruit trees, attacking both the foliage and young fruit; and it was supposed that some of the ravages attributed to Ditula angustiorana might have been the work of this species.

March 4.—G. R. Waterhouse, Esq., in the Chair. Among the donations were a case of insects from Demerara, presented by Mr. Dalton. Mr. Bond exhibited a portion of the stem of a small Ash tree, on the lower part of which was a mass of the empty larva—and pupa-cases of a species of Chilocorus, about 200 in number, attached head downwards, and occupying not more than the space of 4 inches of the stem. He also exhibited some of the web of the social moth, Ilythia sociella, which had been found between two deal planks laid upon each other, the larvæ of the moths having formed burrows in the substance of the planks. Mr. Wilkinson exhibited specimens of the cocoons of the beautiful little Plutella harpella, found in crevices of the bark of Lime trees, from the extremity of one of which the chrysalis had half protruded itself. Mr. S. Stevens exhibited specimens of several species of Noctuæ from Venezuela, absolutely identical with the British species, N. saucea, suffusa, &c., and also a beautiful living specimen of Ceropacha flavicornis, taken the preceding day. Mr. Stainton exhibited specimens of four species of Lithocolletes, reared by him during the preceding month from the leaves of various trees mined by the larvæ, and collected during the last autumn, these moths not ordinarily making their appearance until May, their development having been accelerated by being kept in an inhabited room during the winter. Mr. Douglas exhibited a new British Œcophora, named senescens, from the Island of Portland, and Mr. Stainton read a paper on six new British Tineæ.

*** In our report of the Linnean Society last week, p. 151, it is stated that the young Heteropus measured about a "sixteen-thousandth" of an inch in length. This is a mistake; it should have been "sixteen thousandths of an inch."

Garden Memoranda.

Horticultural Society's Garden, Turnham green.—Since we last visited this establishment, some important alterations have been made. A large portion of the old fruit trees in the middle of the orchard within the Apple belt, more especially on the west side, has been removed, the ground has been all levelled and trenched 3 feet deep, and young trees have been planted. The condition into which the old trees had fallen rendered these operations necessary, more especially in the case of Cherries and Plums, for the roots of both of these fruits had got down into the dry yellow loamy subsoil, and the tops were in consequence rapidly getting into ill health. The new plantations are to be divided into several compartments by 4 feet Grass walks. One of these compartments is planted with young Pear trees, chiefly for the purposes of espalier training; another is occupied with Plums, a third with Cherries, and a fourth is set apart for making experiments with regard to the different modes of training. A portion of the ground on the east side of the orchard has also been remodelled, and is to be employed as trial ground for new and unknown kinds of fruit trees. A number of these trees formerly planted here have been rearranged and placed wider apart, with a view to give them a better chance of fruiting than they would have had in their former over-crowded condition. Nearly half an acre, in the form of a parallelogram running parallel with the Peach wall has also been cut off this part of the orchard, for the better accommodation of vans which bring plants to the exhibitions. This is surrounded by a Holly hedge about 6 feet high, which was lifted from the east side of the arboretum, and planted here last autumn, and it is entered opposite the tents by a wide gateway through the Peach wall a short distance above the "Duke of Devonshire's walk." A border on the outside of the Holly hedge, surrounding the van ground, is being planted with all the newest and best kinds of Strawberries, for the purpose of trial. Although these improvements have to a considerable extent cleared the main body of the orchard of old trees, yet a large mass in the centre still remains untouched. All the young trees have been planted in rows 15 feet apart, and they stand 20 feet from each other in the row. It may perhaps be worth mentioning that horizontally trained Pear trees on walls show bloom thickly from their stems, and even on the stems, to the very extremities of the branches. This may no doubt be attributed to the system of summer pruning which is carried out here. The latter consists in going over the trees at intervals, gradually shortening the fore-right shoots along the upper half of the tree several days before those on the lower part are touched. In this way less disturbance is occasioned to the movements of the sap. We observed some of Mr. Roberts' tiles placed round Strawberry plants, by way of trial; they have a clean and neat appearance, and by the sides of walks in cropped ground form by no means unsightly edgings.

In addition to the work in the orchard, alterations and improvements are being skilfully carried out in the arboretum, under the direction of Mr. Glendinning. A new gravel walk 15 feet wide has been formed from the principal entrance in the Duke of Devonshire's road up to the iron tent, where it ends in a circle surrounded by raised beds; and out of the same circle another walk, of similar width, leads up to the end of the large conservatory. The exhibition tents are to be placed on either side of this latter walk, to which the iron tent stood obliquely; and in order to obviate the incongruity which this would have occasioned in the new arrangement, the latter has been removed and placed parallel with it, so as to range with the other tents. An entrance gate from, and an egress gate to, the Duke of Devonshire's road have also been made immediately opposite the ends and in a line with the tents, by which means the latter can easily be entered in wet weather. The strip of flower-garden which lies between the iron tent and the "Duke's entrance" is likewise being entirely remodelled. As has been stated, the Holly hedge which divided it from the arboretum has been removed; the shrubbery has been set back to the boundary fence; the ground in front is being levelled for Grass, in which flower beds will be disposed along the side of the new walk, intermixed here and there with rare Conifers, standard Roses, and other ornamental shrubs; and altogether this will soon be one of the most interesting parts in the garden.

From the above it will be seen by those who are acquainted with the garden that the main body of the lawn in the arboretum is now thrown into the form of a large square, surrounded by broad gravel walks. It might also perhaps be added that it is intended to place the summer-house, which formerly stood on the lawn in the east side of the garden, at the head of the broad walk which leads from the Duke's entrance to the Council-room, the walk being altered there so as to pass it on either side.

Miscellaneous.

Cheap Microscopes.—Ten years ago, M. Gaudin presented to the Academy of Sciences at Paris, cast lenses of crown glass and rock-crystal, with which cheap microscopes might be made. After many attempts to bring these lenses to greater perfection, M. Gaudin has at last succeeded in producing an instrument which is within the reach of everyone, and which perfectly answers all ordinary purposes. Although it was found very difficult to obtain a perfect glass sphere of the requisite polish and homogeneity, and free from air bubbles, yet M. Gaudin has learned that by using rock crystal, lenses may be obtained which, though not entirely free from bubbles, give such pure images, that one would scarcely believe they were seen through a refracting medium. M. Gaudin has also succeeded in obtaining spherical glass globules, without any appendage; these form his biconvex lenses. The magnifying power of these lenses is from 50 to 400 diameters. The low powers are obtained by plano-convex lenses, that is to say globules with one half, viz., that by which they were suspended, cut away. The horizontal position, as being more simple and less fatiguing, is adopted in these microscopes, so that to see with them they are turned towards the source of light. The lenses are brought to their places by a sliding motion instead of by a rack, the former being quicker and less liable to accident in the hands of an inexperienced observer. These microscopes are intended as auxiliaries to greater instruments, and to render microscopical observations more common than they at present are or can be, from the high price of the instruments. *Comptes Rendus.*

Wild Animals of Ancient Britain.—"To the Notes in Vol. III. Ser. I. p. 356 and Vol. IV. Ser. II. p. 423, on the Wild Animals of Britain, and the Huntings of the Citizens of London, may be added the following, in which it appears that the Wild Cat is enumerated.—R. T. *Rotuli Hundredorum.* 3° *Edwardi I. Membr.* 13.—Item dicunt, Quod Libertas Civitatis Domini Regis talis est: Quod Cives, cum canibus suis possunt currere ad Lepores Vulpes Cuniculos et Murelegos [Catos*] usque ad Pontem de Stanes; et ad januam Parci de Enefende, et ad Arcubus de Stratforde, et ad Crucem de Wautham; sed ista libertas impeditur per Warennam Comitis Cornubiæ, apud Histleworth †, et Warrenam Willielmi de Say, apud Edelmeton ‡; nesciunt quo warranto. "Wild cats," says Pennant, "were formerly reckoned among the beasts of chase; as appears by the charter of Richard the Second to the Abbot of Peterborough, giving him leave to hunt the hare, fox, and wild cat. The use of the fur was in lining of robes, but it was esteemed not of the most luxurious kind; for it was ordained 'that no abbess or nun should use more costly apparel than such as is made of camel's or cat's skins.' In much earlier times it was also the object of the sportsman's diversion.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

General Stoves.—To plants which have been recently potted, a somewhat closer atmosphere, with shading during the hottest part of the day, is necessary, in very fine weather; but the latter should be cautiously used, and only when the plant would be liable to flag without such protection. Heat and moisture may be applied more freely to plants which are in progress; but for economy's sake, make the best use of the sun's rays in furnishing the necessary amount of heat, by closing early, and thus retaining that generated during the day. Make another sowing

* In the copy of the roll in the Chapter-house, Westminster, Membr. 3, the reading is "Catos."—Murilegus, *Voss.* Felis.—*Du Cange*, v. Catta, Cattus.

† Isleworth. ‡ Edmonton.

of Mignonette in boxes, to carry on the supply till the earliest sowing in the open air is fit for use. Fuchsias, Pelargoniums, and other soft-wooded greenhouse plants, whose flowers will not be required for the next two or three months, should be kept in a healthy growing state, by shifting them into larger pots. Use a rich compost, that fine healthy plants may be obtained in moderate sized pots. Let the training of the plants have due attention, as their creditable appearance depends as much upon this matter as upon the colour or shape of the flower. Those plants which are required for present display should neither be stopped nor repotted, but nourished with occasional waterings of liquid manure if they have filled their pots with roots. Attend to the propagation of greenhouse plants, particularly of Fuchsias for autumn and Chrysanthemums for winter display. As Cinerarias go out of bloom, let them have a few weeks' partial repose, to prepare them for commencing their new growth with increased vigour. Seeds of Cinerarias, Calceolarias, Petunias, Humeas, and other soft-wooded greenhouse plants, should now be sown in a gentle heat.

FORCING DEPARTMENT.

PINERIES.—Where Pines are still grown on the pot system, shift such plants as require it into larger pots, using three-fourths peat for the youngest plants, and increasing the proportion of loam as the plants advance towards the fruiting state. If the bottom-heat is supplied by fermenting material, it will require to be frequently examined, to see that the heat does not decline, and thereby check the plants while in an active growing state. Equal caution will be necessary to prevent an excessive or burning heat, which will materially injure the roots, and very probably throw the plants into fruit, whether they are wanted or not. The object should be to maintain in all cases a steady bottom-heat of from 75° to 80°. A little air at the back should be left on night and day, excepting in frosty or windy weather, and for an hour or two on fine afternoons, when the pits are closed and syringed. Assist Pine-apples whose fruits are swelling with clarified liquid manure; but give no water of any kind after they begin to change colour. The manure water should be made in a tank, and clarified by adding some lime or coarse charcoal; as soon as the liquid has become clear it should be drawn off into a second tank, the top of which is nearly on a level with the bottom of the other one. FIGS.—Let the amount of air to Figs in progress be gradually increased, using the syringe in fine weather to keep the red spider down, but it is necessary to avoid excessive use of the instrument, as too much moisture frequently causes the swelling fruit to turn black and fall off; maintain an equable moderate state of moisture about the roots, as the same misfortune not unfrequently results from extremes of drought and moisture. Stop the young growths at the fourth or fifth eye, by breaking, not cutting, the points out, as they do not, if broken, bleed so much. As the stopping of the young shoots goes on, look carefully into the state of the older wood; and where they stand too thickly to admit of the healthy development of the foliage, remove a few at a time of those shoots which seem the least likely to be fruitful. This will be carrying out the principle of summer pruning, or rather thinning, to its fullest extent; and with no tree is it more requisite. It is however important that it be done gradually, otherwise it will cause much bleeding.

FLOWER GARDEN AND SHRUBBERIES.

Those who do not possess a sufficient extent of glass frames for the propagation of Verbenas, Calceolarias, and other half-hardy bedding plants, may make a splendid display by masses of the more durable annuals sown in the places in which they are to remain. It is not to be expected that their beauty will be as permanent as that of the plants for which they are substituted, but with proper exercise of taste in arranging them, the result will be much more satisfactory than many suppose. For white beds use Clarkia pulchella alba, Nemophila atomaria, or white Virginian Stock; for pink or rose colour, Clarkia p. rosea, Saponaria calabrica, or rose Virginian Stock. For yellow or orange, few things make a more splendid bed than Eschscholtzia for summer and early autumn; but if it be more desirable to make a late autumn display, the different varieties of Marigolds are excellently adapted for the purpose; but as their peculiar odour is not in general esteem, they should not be planted too close to walks which are much frequented. For a dwarf very compact bed of yellow, the common Mimulus moschatus is well adapted, if the situation is not too shady; for blue beds, Nemophila insignis, Lupinus nanus, the late blue Forget-me-not, or the beautiful but rather scarce Centaurea depressa. For dwarf scarlet beds, Verbenas, or Geraniums are indispensable, but a taller bed may be made of Pentstemon gentianoides; the different varieties of Antirrhinum majus are also very useful, particularly the dwarf early flowering double white variety; the taller and later blooming kinds may easily be made dwarfer by pegging them down. For a purple bed, nothing surpasses the branching Larkspur, if raised from seed on a small border, planted out 8 inches apart, and pegged down twice during the growing season. The other annuals mentioned above may be sown at once in their places, and thinned out to proper distances. Musk and Forget-me-not are hardy perennial plants, as are also the Antirrhinums and Pentstemons in most parts of the country. The time for sowing annuals must be regulated by the period at which the greatest display will be most useful; and as this will generally vary from the middle of July to the middle of September, the seeds should be sown from the middle of March to the end of June.

KITCHEN GARDEN.

As appearances are so very important in everything connected with a garden, this should be particularly borne in mind in the management of this department, as a considerable quantity of the work is of such a nature as to give at times an unsettled and somewhat untidy appearance; and as the majority of these operations must be performed strictly in season, they do not leave the manager power to wait till his employer's family takes up its quarters elsewhere for a short period, and he must therefore do his best to keep the place neat and orderly, without suspending the work. Much may be done towards keeping things at all times creditable, by a systematic arrangement of the work, and by a steadfast adherence to the simple rule of doing everything well which is taken in hand, and finishing it off in a workmanlike manner before proceeding to another job. This mode of carrying on the work is the most satisfactory, as it allows of concentrated force and greater energy being devoted to that which is still to be done. Let the various quarters, as they receive their crops, be neatly finished off by raking or forking the ground, straightening the edges of the paths, and cleaning and gravelling the principal alleys. After these the main walks in the immediate vicinity, which will be free from dirty traffic for some time to come, should be cleaned, slightly surfaced with new gravel, and rolled; and at the same time the edgings of all the walks should receive any attention which they may require, either by replanting or thoroughly repairing them. If thrift is used as an edging, about one-half of it should be taken up and replanted every season, as it wears a very unsatisfactory appearance if allowed to remain undivided more than two years. Forward Cauliflowers should have some good rotten dung forked in about them, and the soil drawn up round their stems; if the ground is not over-moist let them be watered with liquid manure.

State of the Weather near London, for the week ending March 14, 1850, as observed at the Horticultural Garden, Chiswick.

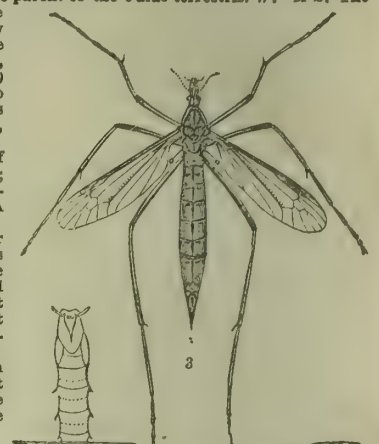
Notices to Correspondents.

BOOKS: *Plod.* Why not take Glenny's "Horticultural Magazine," now issuing in shilling numbers? It tells you all about common things, in a clear and familiar style.—*Medicus.* The books used by Dr. Lindley in his lectures are, "School Botany," "Elements of Botany," "Medical and Œconomical Botany," "Vegetable Kingdom," "Theory of Horticulture," and "Introduction to Botany." The three first are for junior students, the three last for those advanced in the science.

CAMELLIAS: *J M S.* You may drive worms out of your pots by the use of lime-water; but you will not keep them out unless you pot the plants skilfully—closing the hole by a flat crock, and putting plenty of others over it. Consult "Pharo's" excellent directions as to potting in this and a late *Chronicle.*

CATS: *T H.* Take them in pitfalls, or gins of any kind, and do not let their owners have them again till they have made compensation. If they refuse to do so, send the traps, cats and all, to the pound.

CHINA GRASS: *J W O.* The substance you have sent is of animal origin. China Grass thread is obtained from a kind of Nettle.



DISEASES: *H P G.* Your Aerides leaf looks as if it was naturally dying. If that is not so, it has too much water, without light enough to consume the water.

GLASS: *John Keys.* Apply to Mr. Hartley, Glass Works, Sunderland. It is entirely false that there is only one substance and quality of rough plate.

GRASS CUTTERS: *A H, R E.* Budding's is that most generally used. If lawns are kept very close, thoroughly swept from stones, and the weather is dry, it answers well. But we much prefer the scythe in the hands of a good mower, if there is much work to do. Certainly a scythe will not keep a lawn quite so even, but it is more convenient. We do not believe that such machines effect any saving whatever in labour.

NAMES OF PLANTS: *S* Dendrobium macrophyllum.—*M—l.* Oncidium barbatum; Huntleya candida is Warrea candida. Nothing can be a Huntleya without the great fleshy hooded column of H. violacea.—*P P.* 2, Brassia Cowani is B. verrucosa; B. havanensis is either B. angusta or a new species; 16, Osmophytum is Epidendrum inversum; 14, E. polyanthum is E. fucatum; E. Lunæanum is E. varicosum; 25 is E. ellipticum; 13, Maxillaria Parkeri? seems to be M. ochroleuca; M. picta *var.* is not distinguishable from that species; M. lineata is the darker variety of M. punctata; 3, Cattleya piperita is a plant we do not recognise; it requires to be studied while alive; 15, Cœlogyne fuscescens (?) is C. fuliginosa; 11, G. Shepherdi (?) looks like a flower of G. Jenischii; Oncidium macranthum (?) is a much finer thing, viz., the O serratum; 23, Huntleya candida of *Morel* is Warrea candida, *Lindl.*; 10, Bletia pulchella is one of the many varieties of B. verecunda; 20, B. Galeottiana is a plant we are unacquainted with. Will you have the kindness to order "Paxton's Flower Garden" through the booksellers. It cannot be sent to Paris under band without injury and needless expense.—*X Y Z.* Aponogeton distachyum.—*S K.* Tecoma australis.

INSECTS: *S F.* Your larva is not the true wireworm, which is more cylindrical, with the tail not forked, as in yours, which is however the larva of an allied species of Elater, although probably not so injurious as the wireworm. *W.*—*M S.* The black Tipulidan larvæ are much smaller than those of the common daddy long-legs, but they are those of a much smaller species of Tipula. Lime-water will probably be effectual, if you can contrive that it shall reach the grubs. *W.*—*Mechanic.* Gas-tar water will be effectual in destroying the Julus terrestris, if you can make sure of its reaching the insects. A better plan is to sink chip pottles, filled with moss or damp vegetable matter, into the neighbourhood of their retreats. They will be decoyed to these receptacles, which must be examined from time to time, and the insects destroyed. The beetle figured in our Notices of Feb. 16, 1850, is not the parent of the Julus terrestris. *W.*—*M S.* The larvæ of the common daddy long-legs (See *Gard. Chron.*, 1841, p. 612) are difficult to destroy. 1 is the larva; 2, the pupa, sticking out of the ground; and 3, the perfect insect. A mixture of gas-tar water and lime is perhaps the most effectual remedy; but the lawn must be quite saturated; the larvæ will even then crawl out of reach of the effects of the mixture. A more serviceable method seems to be to pare off the Grass, turn up the earth, and send in a lot of ducks. You will thus kill two birds with one stone—that is, kill the larvæ and then the ducks, which will soon be fat enough. Otherwise employ children to catch the flies in gauze bag nets as soon as they make their appearance. *W.*

PEARS: *Anon.* The Shobden Court and March Bergamot Pears are almost equal in quality to the Monarch. They seem to bear the high winds in September better; but having only seen them fruited on dwarfs we have not full experience on this point. They are valuable on account of their hardiness and long keeping. They are good bearers. It is difficult to say whether the Eyewood or Norris's Pear is the best; they are both excellent in their respective seasons; if you cultivate both, the Eyewood will succeed the other. The Captif de St. Hélène is the Napoleon. The Duchesse de Mars will do as a standard; good, but there are better. Broom Park and Orpheline or Beurré d'Aremberg will succeed as standards; but the Broom Park is the hardiest.‖

PITS: *Irish Amateur.* Cucumbers will bear a much higher bottom-heat than Strawberries; for they are natives of the East Indies, and 75° are not too much for them when forced. What appears to have happened to your plants is that the roots have become dry; a circumstance very likely to occur with your arrangements. A cold current of air would not affect a single leaf at a time, but would act upon every leaf it touches. Read Moore on the Cucumber, a very cheap little book.

PLUMBAGOES: *Lover of Flowers.* Your P. capensis is too luxuriant to flower, and you have kept it growing too late in the autumn. As soon as it has made its young wood, endeavour to get the latter well ripened by gradually withholding water, but not altogether, and by exposing it to sun and air. The flowering depends greatly on the wood being well ripened.‡

QUICK GROWING PLANTS FOR A WALL: *Anon.* Tropæolum canariense, Lophospermum Hendersoni, and Eccremocarpus scaber will answer your purpose.‡

RAIN: *C B H.* The following are the monthly quantities of rain which fell at Chiswick in 1849:

January	...inches—1.73	August	...inches—1.60
February	... ... 2.52	September	... ... 2.49
March	... ... 0.85	October	... ... 2.18
April	... ... 2.21	November	... ... 1.32
May	... ... 3.53	December	... ... 1.28
June	... ... 0.31		
July	... ... 2.82	Amount for whole year...	22.84

You will find a tabular statement of the monthly depth of rain from 1841 to 1849, inclusive, at p. 8 of the present vol.‖

VINE BORDERS: *C D E.* It is a very bad practice to turf them. If you must have something on them, then sow them with the more slender growing annuals, as Mignonette, &c., or plant them with Verbenas; but they should never be cropped, if it can be avoided.‡—*J D.* There can be no harm in removing the top soil carefully, and replacing it by degrees with rich compost, with a view to induce the roots to approach the surface; but if you can go to the expense, we would advise you to lift the Vines in autumn, concrete the bottom of the border, and then replant them.‡

VIOLETS: *A and V.* If double Violets become single, it is probably because the ground they are grown in is not in good heart. They will not succeed where the soil is very poor. If you wish to keep them in tufts, and to have them fine, you must lift them occasionally, and plant the runners in well prepared beds of fresh soil; or else top-dress them with rich earth mixed with bone-dust.‡

MISC: *W P.* You quite mistake the matter. We do not in the least complain of it; we have no cause to do so. Every one has a clear right to employ his talents in the most advantageous way he can consistently with fair dealing. There is no unfair dealing at present on this gentleman's part; and we wish him success. Do you think it respectable to act like a dog in a manger?—*L L.* The Winter Violet Grass is the Cochlearia acaulis, *alias* Ionopsidium acaule. It may be had of any great nurseryman, and all little ones can procure it, if they will take the trouble.—*J W.* We cannot recommend dealers.‡—*V P T.* Succulents are the most suitable plants for growing on the leads of your town house. Try different kinds of hardy Sedums, as S. acre, Sieboldii, Fosterii, rupestre, and others; the common Houseleek, Sempervivum tectorum, arachnoideum, Penthorum sedoides, Umbilicus pendulinus, Mesembryanthemum pyropæum, &c. Some annuals, as Nemophila insignis, Collinsia bicolor, Clarkia pulchella, Leptosiphon densiflorus, Phlox Drummondii, and Mignonette may also flower with you. The adhesive composition used on the postage stamps is probably gum arabic and brown sugar, with a little Tragacanth powder.‡

SEEDLING FLOWERS.

CINERARIAS: *M B.* Petals blue, fading to white in the centre; shape and texture good, size middling, a nice showy variety.*

LUCERNE.—JUST IMPORTED a large quantity of excellent new Lucerne Seed, price 80*s.* per cwt., in quantities not less than 28 lbs. Also the best Perennial GRASS SEEDS AND CLOVERS FOR PERMANENT PASTURE at very low prices; and SUTTON'S RENOVATING MIXTURE for improving old Pastures, price 1*s.* per lb., consisting of the finer sorts of Perennial Grasses and Clovers.

Address: JOHN SUTTON and SONS, Reading, Berks.

*** *Carriage free by Great Western, South Western, or South Eastern Railways.*

Glass Shades; Tiles and Slates of any size; Wasp Traps, 3*s.* 6*d.* per dozen; Lamp Shades; Rough Plate Glass of every thickness. Lactometers, for trying the quality of milk, 4 tubes, 7*s.* 6*d.*; 6 do., 10*s.* Glass Stands for Pianoforte, and every article in the trade.

JAMES PHILLIPS AND Co., 116, BISHOPSGATE-STREET WITHOUT, LONDON.

HARTLEY'S PATENT ROUGH PLATE GLASS FOR CONSERVATORIES, &c.

See Article in THE GARDENERS' CHRONICLE of Saturday, December 8, 1849.

"Continued experience leaves us no room to doubt that this is the best material yet produced, and that it will in time supersede glass of all other kinds for the greater part of Gardening purposes." . . . "As for the article substituted for Rough Plate . . . it is wholly unfit for any horticultural purpose." . . . "The best sample of it which we have yet seen was Manufactured by Messrs. HARTLEYS, AND SOLD BY MESSRS. JAMES PHILLIPS & CO., 116, BISHOPSGATE STREET."

CROWN, SHEET, AND ROUGH PLATE GLASS, FOR HOTHOUSES, CONSERVATORIES, &c.

Of every manufacture FIT FOR USE, including the make of Messrs. CHANCE, HARTLEY, SWINBURNE, and others.

100 and 200 feet cases of large Sheet Glass, from 2½*d.* per foot. Small ditto, 10*s.* 6*d.* per 100 feet, packed in boxes ready for immediate delivery. Curators of Botanical Societies, Florists, Railway Agents, and others requiring large quantities, will, on sending dimensions, receive estimates at the lowest prices.

GLASS MILK PANS, CREAM POTS, Lactometers, Bee Glasses, Fish Globes, and all kinds of Dairy Glass, Propagating Glasses, Hyacinth Dishes, Cucumber Tubes, and every other description of Garden Glasses.

PATENT GLASS PENS, self supplying, never blot, never soil the ruler, and will write continuously for 12 hours.

Also, Glass Rulers, Glass Inks for office-stands, desks, &c. Stationers and Schools supplied. Wholesale Warehouse for Ornamental Shades, Lamp Shades, Gas Glasses, Genuine White Lead, Paints, Colours, and Pumps for Farm purposes.

Our Catalogue of 18 folios is the most complete ever published. No Gardener or Farm Bailiff should be without one. May be had Gratis on sending two postage stamps to Messrs. COGAN and Co., 48, Leicester-square, London.

GLASS FOR CONSERVATORIES, HORTICULTURAL PURPOSES, &c.

T. MILLINGTON'S SHEET GLASS, which is of the best description, varying from 16 to 32 ounces, at from 2*d.* per foot and upwards; 100 feet and 200 feet cases of large Sheet Glass, for cutting up, at 2½*d.* per foot. British Plate Glass, from 1*s.* 2*d.* to 2*s.* per foot, according to size. Patent Rough Plate Glass, from ¼ to 1 inch in thickness, from 4*d.* per foot upwards. Glass Slates and Tiles. Milk Pans from 12 to 24 inches diameter, from 2*s.* to 5*s.* each. Cucumber Tubes, from 12 to 24 inches long, at 1*d.* per inch. Lactometers, 7*s.* 6*d.* each. Wasp Traps.—Lists may be had, on application at the Warehouse, 87, Bishopsgate-street Without, same side as the Eastern Counties Railway.

HOT WATER APPARATUS AND HORTICULTURAL BUILDING.

W. HILL begs respectfully to announce that his improved "FLUE BOILER" may now be had in sizes to suit every description of Apparatus, from that of 100 feet to 2000 feet of 4-inch pipe. Improved STEAM BOILERS, from one horse-power and upwards, adapted either for stationary or portable engines, and guaranteed to be most effective.

Every description of Horticultural Building constructed upon the best principle. Buildings of any kind heated by hot water.

*** A liberal Discount to the Trade.

W. HILL, Horticultural Works, Greenwich.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

Corn and Grass Manure, per ton ...	£10	0	0
Clover Manure, do.	11	0	0
Turnip Manure, do.	7	0	0
Superphosphate of Lime	7	0	0
Sulphuric Acid and Coprolites ...	5	0	0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

LAWES'S PATENT MANURE.

WILLIAM E. RENDLE AND CO., Plymouth, are Mr. Lawes's Wholesale Agents for the Sale of his MANURES, and can supply them at Mr. Lawes's prices, delivered at his Factory, Deptford Creek.—Apply to WILLIAM E. RENDLE and Co., Union-road, Plymouth.

GIBBS' GENUINE PERUVIAN GUANO, *warranted*, at 9*l.* 15*s.* per ton. In the Import Docks.

GUANO AND OTHER MANURES.

PERUVIAN GUANO of the finest quality (as imported by the Contractors) on Sale; also Superphosphate of Lime, Gypsum, Nitrate of Soda, Salt, and all other Manures of known value.—Apply to MARK FOTHERGILL, 201A, Upper Thames-street, London.

POTTER'S GUANO. — This effective MANURE, now greatly Improved, is confidently recommended as a Dressing for all Spring Crops. It is equal to Peruvian Guano, and 25 per cent. cheaper. Also SUPERPHOSPHATE of LIME, GYPSUM, and SULPHATE of AMMONIA, all of guaranteed quality, and Cheaper than at any other establishment in town or country.

Factory, 28, CLAPHAM ROAD PLACE, LONDON.

GENUINE PERUVIAN GUANO, direct from the Importer's Stores, LINSEED CAKES, and all kinds of Artificial Manures, may be had at London prices, for Cash, of Messrs. ODAMS and PICKFORD, 15, Mark-lane, London.

THE LONDON MANURE COMPANY beg to offer as under, and pledge themselves that every Manure shall be perfectly Genuine:—Corn Manure for Wheat, Barley, Oats, Clover—most strongly recommended from its success last year; it will be found cheaper than Guano, and bear the strictest analysis. Also URATE, Superphosphate of Lime, Sulphate and Phosphate of Ammonia, Nitrate Soda, Fishery and other Salt, Gypsum, Sulphuric Acid, &c.

GENUINE PERUVIAN GUANO.—To insure this free from adulteration, all purchasers, if they prefer it, can receive their warrants from Mr. Purser, and remove the Guano direct from the Warehouses of Messrs. A. GIBBS and SONS, the Importers. Bridge-street, Blackfriars. EDWARD PURSER, Secretary.

Country Dealers and Agents supplied.

CORN MANURE.

BLASHFIELD'S PATENT COPROS.—A new Manure for Corn and other Crops, prepared from the nitrogenous matter deposited on the banks of the Thames, in combination with other substances essential for the growth of corn, &c., price 8*l.* per ton. Sold, in a finely ground state, at No. 3, New London-street, Mark-lane; also, at the Works, Mill-wall, Poplar; Waterloo Dock, Lambeth; and No. 1, Praed-street, Paddington Basin.

PATENT COPROS, for Corn crops, also for Turnips, &c.; Superphosphate of Lime, Gypsum, calcined and saturated with liquid manure. CEMENT for Liquid Manure Tanks, Malt House Floors, and Barn-floors, manufactured by J. M. BLASHFIELD, successor to Wyatt Parker and Co., Original Patentees of Parker's Cement. Established 1796. Drain Pipes, Tiles, &c.

WEDNESDAY, — 27—Agricultural Society of England.
THURSDAY, — 28—Agricultural Imp. Society of Ireland.
FARMERS' CLUB.—March 22: Hadleigh.

IT is not very many years since THE RELATIONS OF GEOLOGY TO AGRICULTURE were first to any extent developed. And then the novelty of the proposition, as well as the ability of those who enunciated it, made people attach too high an importance to the subject. But the usual fate of whatever excites unreasonable expectations, has already befallen agricultural geology, and from the rank of a first-class topic in agricultural literature, it has fallen far below its rightful status.

There were two principal doctrines on which its reputation stood: 1st, That the nature of the soil was accurately indicated by that of the rock on which it lay; and 2d, That the mixture of earths was essential to the attainment of a perfect texture of soil. And two inferences were immediately drawn from them—viz., That a geological map was at once and cheaply the equivalent for a land-surveyor's report—that, in fact, given the nature of the soil in any locality and the boundaries of the formation on which it was situated, and you immediately had the character of the soil throughout the whole space they included: and—that a knowledge of the various strata which English geology includes, and of their mineral contents, was of essential importance to the true economy of English agriculture. Now it is unquestionable that a knowledge of the mineral structure of the island will be of material value to landowners, whether in relation to its agriculture or its manufactures; but the immediate influence of such knowledge on the texture of the soil is rarely possible. In some localities, as along either side of the chalk formation, where on the one side the clays and sands of the gault and green sand, and on the other those of the plastic clay, are capable of mixture with the soil of the chalk, or with one another, without great expense of carriage; no doubt this point, which geologists insist upon, is practically useful; and in other districts, too, where the study of the subsoil has revealed the existence of marl beds, the use of this knowledge has been apparent. But the exclusive importance of this method of altering a faulty texture has fallen before the more generally useful methods which the drainage of wet lands and the burning of stiff clays present. And to this in some measure, no doubt, is due the diminished reputation of geology as the assistant of agriculture. But it is chiefly from the failure of the first named of its pretensions that its lower character is owing. Geological maps, as at present constituted, rarely give anything more than the structure of the land so far as rocks *in situ* are concerned. Above these, in many instances, beds of transported material lie between them and the soil; and thus, for instance, the marl of the red sandstone group has often had no influence at all upon the nature of the soil above it; for it was obscured by the accumulations of boulder stones and drift before that soil was made. And even where no such obliterations of the older geological features of the land had taken place, and the soil might be supposed to have been derived wholly from the disintegration of the rocks below it, this appears to be by no means the case; transported particles are mixed with others of an origin less remote; and it appears that there is a complete gradation in the series between the few cases of soil which have been formed wholly by the disintegration of the immediate subsoil, and the few where it has been formed wholly by the disintegration of rocks at a distance whose wreck has been brought down from the uplands by the floods and deposited along the shores of more quiet waters. Besides the smaller relative importance now attached to the mixture of the soils as a means of improving their texture, we thus have the proved inaccuracy of the idea that a geological map is also in any respect an agricultural one—indicating the nature of the soils by that of the rocks below them; and to both of these circumstances must be attributed the partial failure of geologists as agricultural instructors; to both we attribute their diminished reputation in the eyes of farmers. And thus it is unfortunately the case that the latter now attach far less importance to geological knowledge than is properly its due; for to give the facts and doctrines of geology their proper rank and position among the facts and doctrines of agriculture, certainly appears a very desirable thing.

There are two grounds on which the value of geological knowledge to the farmer may be contended for; and these are precisely those on which its advocates have already stumbled. The knowledge of the mineral contents of any formation has of late years, in some instances, proved of far higher agricultural importance than ever was the acquaintance with merely its sand, or its clay, or its lime, on which geologists used to rely. Mr. PAINE, of Farnham, has lately given agricultural significance to certain facts which had previously been known to geologists regarding the strata immediately under the chalk; and the vast accumulation of phosphoric acid, which they are now known to contain, may well encourage search in other formations also after a raw material of such inestimable value in the agricultural manufacture. And as regards the composition of soils, the knowledge of the proportion in which the disintegration of the subjacent rock has contributed to the formation of the soil above it, and of the extent to which the drifted material is present will, when the composition of each is known, be of the very same value which a knowledge of the rock alone was formerly believed to possess.

These remarks are suggested by the perusal of a pamphlet lately published by Mr. TRIMMER, of the national geological survey, entitled "Proposals for a Geological Survey," specially directed to agricultural objects.* It was Mr. TRIMMER who first drew particular attention to the imperfections of the older geological features of a district as guides to its agricultural character: and in the pamphlet referred to he developes the nature of the information which an examination of the superficial deposits and their influence on the soil is likely to afford. We strongly recommend the pamphlet to the notice of those landowners who are desirous of a more than surface knowledge of their property.

ON A SPINELESS VARIETY OF FURZE.

By M. L. VILMORIN.

I HAVE the honour to lay before the Academy some specimens of an accidental variety of Furze, Ulex europæus, which is of considerable interest, as well in an agricultural as in a scientific point of view.

A few years ago M. Frochu, the celebrated agriculturist, showed me in his fields a few plants of the common Furze without any spines whatever. It is from him that I have obtained the present specimens, which were accompanied with the following details:

"Specimen No. 1 was taken from some plants of the herbaceous variety, the spines of which had lost their sharpness and become fit for fodder. Cattle of all descriptions eat it, without any preparation, as they would Clover; it grows in tufts instead of sending out long shoots which soon become woody, as is the case with

* RIDGWAY, Piccadilly.

the common species. One circumstance which assists its taking this form is the avidity with which hares, rabbits, and other animals devour it. This kind of pruning being continually repeated gives the plant the appearance of a bush that has been clipped by a gardener. The present variety is, however, very scarce. On the whole of my property, comprising an extent of three or four leagues, there are hardly two dozen plants of the herbaceous, although there is a large quantity of the common variety. A considerable number of plants evidently approach the herbaceous state, but there are very few which have completely attained it. I never succeeded in reproducing this variety from its seeds, of which there are very few. About four years ago, I found several plants much more herbaceous than the accompanying specimens, but they have all disappeared, probably in consequence of the soil around them having been disturbed in removing their spiny neighbours to prevent hybridising.

The interest attaching to this remarkable variety is, in an agricultural point of view, very considerable, when it is remembered that the common Furze, in consequence of its spines, has to be well bruised before it can be eaten. A variety which does not require such a preparation may be regarded as one of the best kinds of fodder, equalling, if not surpassing Lucerne itself; it would indeed be the Lucerne of poor lands.

It may be as well to add that in consequence of the presence of organs which appear to be true leaves, bearing buds in their axils, M. Frochu's spineless Furze has a branched and tuft-like appearance, which contrasts with that of the common variety; for in the latter, the spiny axillary branches once formed are no longer susceptible of elongation, and the plant only grows at the extremities of its principal branches.

The method of reproducing a spineless Furze from seed is one of the most important problems to which scientific farmers can turn their attention; and although M. Frochu's first attempt has been unsuccessful, everything leads him to believe that such a thing will ultimately be done. It is not improbable that the process of budding, made use of in England for the propagation of the variety known as Ulex hibernica, may be employed with success for propagating the spineless variety, and for extending the advantages it offers as a valuable food for cattle. *Comptes Rendus.*

REPORT TO A LANDOWNER.

This farm rests on the new red sandstone formation, but the sandstone is generally covered with the drift peculiar to this formation, composed of sandy gravel. The active soil upon this drift is of a good depth, from 1 to 2 or more feet in depth, of a sandy loam, or of a sandy gravelly loam, which is a productive soil in moderately dry or in damp seasons, although on some parts, where the gravel is nearest the surface, the crops burns in very dry seasons, from want of moisture. The whole of the land is in an excellent state of cultivation. I have very seldom seen a farm in such a highly cultivated state; every field is clear from weeds, except about 14 acres of Wheat stubble, in which there is some Couch, and which is being cleaned.

The interior hedge-rows and timber have been grubbed up at a considerable expense, to form the arable part of the farm into four fields, averaging about 38 acres each; land has thus been gained by the removal of the hedgerows. The system of farming which the present tenant has adopted (the four-field or Norfolk system), is the best which could be adopted on this dry Turnip and Barley soil. The meadows are under the same excellent management; the whole of them have been drained at a considerable expense. The river has been cleaned out, straightened, deepened, and a river wall built, all the old water-courses filled up, the ground levelled, and the whole formed into an excellent productive water meadow, able to produce more hay than is required for the stock on the farm. All the water courses are now cleaned out, and ready to put the water on. There are also about 32 acres of rough meadow and rough pasture. The rough meadow (about 4 acres), has been drained, and is now productive of large crops of coarse hay; the remaining 28 acres, some of which, by the buildings, produce good crops of pasture, but the remainder was originally coppice, which was grubbed up, and is now converted into pasture; this makes a good sheep walk, which has been greatly improved in value as such, by adding two or three pieces to it, so as to make it surround all the arable land, thus enabling the sheep to be taken from it into any of the arable fields without driving them on to the road.

All the fences are in the best possible state of repair; there is, however, a good extent of old pit-iron chain, and iron hurdles, of which the fences by the river and by the building are composed, and which belong to the tenant, but which should be taken to by the landlord, and left as fixtures.

The buildings are the best I have ever seen on a farm of this extent; I do not think there is anything wanting, and the whole are built most substantially; indeed too much so, for all the roofs have king posts, which is seldom or ever used for sheds. The whole is in a most perfect state of repair.

The house is of a character equal to a farm of more than double the size of this, and will accommodate a family, and is altogether such a residence as will command a man of capital and respectability, or a tenant who may farm for his amusement, and who will not only farm it well, but may greatly increase its productiveness. The house and farm buildings, according to the account I have received, were in a most ruinous state when the last tenant left it, and the expense of putting them into their present state has been very great; the whole of the land was completely run out, foul, and badly cultivated, and it took three or four years to get it into its present state of cultivation, and at an expense of from 2*l.* to 3*l.* per acre.

In estimating the value of land we have not only to take into account the nature of the soil and subsoil, and the best mode of cultivation, which will make and keep it in the most productive state; but to whatever state of productiveness we may have brought it, it is the market price of the produce which regulates the money value of our crop. It is the money we get for our produce which enables us to pay for horse and manual labour we employ, the implements and manure we use, the interest on our capital which we employ, upon which we live, as well as the rent, rates, and taxes we pay. It must, therefore, appear that whatever portion of the produce may be fixed on as a fair rent for land, it is the money price only of this portion which the farmer is able to pay in money as rent; and as the price of grain is so variable, a corn or produce-rent is the only fair and equitable one. The price of Wheat has varied from 5*s.* to 25*s.* per bushel within the last 40 years.

The average price of Wheat for the seven years previous to 1843, when the last tenant left, was 7*s.* 7½*d.* per bushel, and the rent was 316*l.* in money, which was the money he received for 840 bushels of Wheat at 7*s.* 6*d.*; and the tithes and parochial taxes were at that period 112*l.* 10*s.*, which was covered by the price he got for 300 bushels of Wheat, so that 1140 bushels of Wheat at 7*s.* 6*d.* produced a sum equal to the rent and taxes paid for this farm, amounting to 428*l.* 10*s.* The price of Wheat and other corn crops, and also of beef, mutton, and pork, have gradually fallen; the average of the six years previous to 1849 was 6*s.* 9*d.* for the bushel, and the price of Wheat in 1849 has come down to 5*s.* 3*d.*, as the average of the year. So that if the land was not more productive now than it was when the present tenant entered upon it, in 1843, the rent of 316*l.*, which was then represented as the price of 840 bushels of Wheat, would now, at 5*s.* 3*d.*, only amount to 221*l.* 0*s.* 6*d.*

I have been thus particular that you may see the principle upon which rents are fixed; but landlords prefer money rents, because, as they say, they like to have their incomes fixed, whereas a corn rent must necessarily fluctuate as the price of corn fluctuates. Some tenants prefer a money rent, for the reason, they say, that they know what they have to pay; but then the tenants must be convinced in their own minds that the money rent they agree to pay during the period of their lease will be within the price which they expect to get for that quantity of Wheat which they have fixed on as a fair rent. I went over the farm on the 22d ult., and examined every field minutely, and fixed what I conceived the value of each field should be in produce, and on the day following Mr. —— came, and I went over the whole with him, and got his account of the state of the arable fields, the buildings, and meadows in 1843, when the last tenant left. My valuation of the farm consisting of 196 acres (exclusive of the mill), reducing all the produce to Wheat, is equal to 1332 bushels of Wheat, out of which the tithe and other parochial rates are to be paid; the remainder will be for the rent. The tithes and parochial taxes are now reduced to 107*l.* 18*s.*, which will require the sale of 392 bushels of Wheat to give this sum at what I think the average price may be for some years longer, viz., 5*s.* 6*d.*, and there will, therefore, be 940 bushels for rent, which, at 5*s.* 6*d.*, is 258*l.* 10*s.*; to this must be added the seven cottages which the present tenant lets to his labourers at 23*l.* 5*s.*, but as he has to keep them in repair, say, 18*l.* 10*s.*; making a total of 277*l.*

The price of grain at this present time being so low, I think there will be a greater difficulty in getting 250*l.* of rent for this farm than there will be in getting a rent of 940 bushels of Wheat at the average of the kingdom; and by a grain rent you would have the advantage of the rise in Wheat, and if it should in any one year get up to 7*s.* 6*d.* per bushel, the 940 bushels would give you 352*l.* 10*s.*; but you will also suffer by the fall in the price of grain. I think it possible to get a good tenant to give 1000 bushels of Wheat, including the cottages, which at 5*s.* 6*d.* would amount to 275*l.*, and which at 6*s.* would be 300*l.*, and at 5*s.* would be 250*l.*

Valuation of the live and dead stock on this farm. As all kinds of stock are low and falling in price, it is probable that my estimate may not give a correct idea of what it will fetch if put up to sale, or if taken at a valuation by the in-coming tenant.

There are 181 sheep, which we have put at		£341	2 0
9 horses and a pony		218	0 0
61 pigs of various sizes		207	5 0
2 cows and 6 heifers		61	0 0
Live Stock		£827	7 0
The Implements cost 1000*l.*; the wear and tear will reduce their value 60 per cent., so that they may now be worth		400	0 0
Corn, 500 bushels of Wheat, at 5*s.*	£125 0 0		
630 ditto Barley, at 3*s.* 4*d.*	105 0 0		
270 ditto Buckwheat, at 3*s.*	41 0 0		
		271	0 0
35 tons of hay, at 3*l.*	£105 0 0		
Straw and manure in the yard	119 5 0		
Unexhausted cultivation in the land worth	366 7 6		
		590	12 6
		£2088	19 6

In Sussex, Kent, Essex, and some other counties this sum would be given, as the custom of these counties is to value all the hay, straw, manure, and the unexhausted cultivation left in the land by the out-going tenant for the profit of the in-coming tenant, but in Shropshire the straw, the manure, and all the cultivation is claimed as belonging to the in-coming tenant without any payment, and hence the land is run out. Everything is taken out of the land by the out-going tenant, and it is left in as bad a state as the present tenant found it in. The manure, straw, and unexhausted cultivation, which I have put at 485*l.* 12*s.* 6*d.*, would be lost by the custom of Shropshire, and the out-going tenant would get one half the value of the Wheat crop, which might amount to 133*l.*, so that there would be a complete loss to the present tenant of 352*l.* 12*s.* 6*d.* I would therefore advise you to bind the new tenant to take to these things at a valuation, and in his lease give him the power of getting it back again at the end of the lease.

The following account is a statement of monies expended in the permanent improvement of the land and buildings on this farm:

To expense of draining the meadow, deepening and straightening the river, filling up the old water courses, and making it into a water meadow, in addition to the tiles and bricks paid for by the landlord		£383	10 0
To draining mill meadow, making pig sty and shed		22	7 6
To horse and manual labour in carting 550 loads of earth, and filling up a pond and old quarry, and making land of them, at 1*s.* 6*d.* per perch		41	5 0
To grubbing up the roots in the coppice, 5½ acres, at 7*l.* 10*s.* per acre		41	5 0
To grubbing up roots in the coppice, and preparing posts for fence		30	2 1
To grubbing up the internal fences, 655 days, say 2*s.* per man		65	10 0
To expense of making a new fence on both sides of the new road, and also by the buildings, and preparing and morticing posts and rails, and for the iron chain, digging the ground, and planting; in all		153	18 7
To making a new road from the farm to the river, and to the meadow		118	10 0
To quarrying 975 yards of stone—building the river wall—sand and lime—carrying the stone to the river wall and farm buildings—and building three bridges to the meadow		316	17 3
		£1173	5 5
To building the new part of the house and repairing the old (this you have seen) £904 8 8			
Of this sum the landlord paid 205 0 0		699	8 8
To hauling all the timber and other materials, 20 days of seven hours—10 men—at 20*s.* per day		20	0 0
		£719	8 8
To the expense of farm-building—the old part was fresh roofed, and much new was added—15,000 bricks, 13,000 tiles, including hauling, builder's bill, &c.		1244	0 1
To building, in addition to the 21 pigsties, a dwarf wall around the sheds and barn, including 30,000 bricks, bricklayer's bill, lime, sheet-iron for a roof, and making three stack staddles		153	15 1
		1407	15 2
Of this sum the landlord paid		928	3 5
The remainder was paid by the tenant		£479	11 9
Recapitulation:			
Draining meadow, river, and building river wall; making road, quarrying, hauling stone, &c. See above		1173	5 5
Paid for house over what was allowed by landlord		719	8 8
" farm-buildings over what was allowed		479	11 9
		£2371	17 2

This was a large sum expended by the tenant. I have the detail of each item, which I can send you if you wish it.

In Lincolnshire, and some other parts, where the tenants lay out money, with the consent of the landlord (when the tenant holds from year to year), the tenant is allowed to occupy them for 21 years; or if he leaves with the landlord's consent, then he is allowed $\frac{1}{21}$ part of the sum he has expended for every year short of 21 years; so that, if the present tenant had occupied this land and buildings for seven years, then he would be entitled to two-thirds repaid him, because seven is one-third of 21 years. I mention this in case you wished for my opinion as to the money laid out on the buildings and other permanent improvements. *J. M.*

INSTANCES OF CATTLE FEEDING.—No. III.

1. Four three-year-old strong Scots.
2. From the fourth week in January to the first week in April.
3. Fed in stalls; two beasts to 5 square yards. (Query 5 yards square).
4. Fed completely on Bean, Barley, and Tare meal mixed dry with hay and straw chaff, varying from 4 to 6 pecks per diem for four bullocks, with from 18 to 20 pecks of chaff.
5. Two good cart-loads weekly of Wheat straw.
6. Put up at 17 stones (imperial), valuing 6*l.* 7*s.*; sold out at 40 stones (imperial) valuing 15*l.* 7*s.*, the four having cost 2*l.* 8½*d.* per week.
7. The condition of the animals as to cleanliness and comfort during feeding excellent.

This experiment was tried in 1844. *Howard Reed, Long Sutton, Lincolnshire.*

PRICES OF WHEAT.

I send you another Table relating to the Prices of Wheat, from the official reports obtained by Mr. Wilson, and alluded to in the Debate in the House, on the 21st ult. As a multitude of figures, however, are not very attractive reading, I have shortened it as much as possible, merely stating what is absolutely necessary to make the results clear to the eye. I believe the accuracy of the figures may be depended on.

It gives the prices of Wheat, for the last 10 years, in France, Belgium, the Prussian provinces (averaged on those of Pommerania, Posen, Saxony, Silesia, Westphalia, and the Rhenish districts), and also the shipping prices, during the winter season, at the ports of Amsterdam, Lubeck, Hamburgh, and Dantzic.

These afford, together, a fair average of what may be called the European prices, for the period referred to. I should be glad if the port of Odessa was included; but its great distance, the less suitable quality of the Wheat, and its comparative independence of our consumption, from its contiguity to the Mediterranean demand, render its influence not so great as that of the Baltic ports upon the English market. The table will repay study.

Price of Wheat per quarter in	1840.	1841.	1842.	1843.	1844.	1845.	1846.	1847.	1848.	1849.
	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.
France	51 6	43 3	46 9	49 5	47 3	47 3	57 6	69 7	39 9	33 9
Belgium	51 6	48 0	53 0	46 9	42 6	49 0	58 0	74 6	43 3	38 3
Prussian Provinces	36 5	34 3	37 9	32 0	29 9	34 2	44 5	57 4	32 2	30 0
Amsterdam	53 10	60 4	41 6	43 0	36 6	58 2	58 10	63 2	50 0	40 6

Dantzic	55 0	54 0	44 0	38 0	34 0	48 0	55 0	75 0	44 0	40 0
Average	46 4	49 8	41 3	40 2	35 5	47 9	54 0	62 3	42 2	36 6
England	66 4	64 5	57 5	50 2	51 3	50 9	54 9	69 5	50 6	44 6
Difference	20 0	14 9	16 2	10 0	15 10	3 0	0 9	7 2	8 4	8 0

It will be seen from the above Table that the two years of greatest plenty over Europe, during this decennial period, have been 1844 and 1849. What the European average would have been in the latter year, with so unusual an abundance in France and Belgium, —had it not been for the opening of the English market—it would be difficult to conjecture: for these two, despite their *dense* cultivation, are generally importing countries. (I use the word dense in allusion to their population, for the acreable grain-produce, in both, is far inferior to that of England.) It is quite plain that the *continued* depression of prices in England latterly is due not so much to the abundance over the wide area of the Prussian provinces as to that in France, which since 1847 has been almost unprecedented: the price of Wheat having sunk, there, from 20 francs the hectolitre (about 2½ bushels), which had been the *average* price for the 20 years previous, to only 13 francs, a fall greater than that which we have suffered, in the ratio of 21 to 16. Indeed our chief imports since Christmas have been of French flour.

But I think anybody who looks at the column under the year 1849, and marks the general and extraordinary abundance and resulting cheapness last year which it exhibits over the Continent, and that, too, in spite of the export to England of nearly six million quarters of Wheat, will cease to apprehend the likelihood or possibility of such a state of things continuing. If he will cast his eye along the line of averages, the tale will speak for itself; and on comparing the year 1849 with the other low year (1844), he will see that the English price of the latter year stood only seven shillings a quarter higher than in the former. Our Corn-law abolition has fallen on a most unlucky juncture!

But these two years are entirely exceptional. The average of the whole line of European averages (from 1840 to 1849 inclusive), is 46*s.* 7*d.* a quarter, and it need not be objected that the year of scarcity (1847) is included in this average, for if that and the other highest year be taken with the two lowest before named, the average still comes out 47*s.*

Here, curiously enough, we again come into that seemingly 'magic circle' of 47*s.* a quarter, as an upset average price. It comes out upon the cards, examine them how one may. I am far from thinking that the price will never be higher than that point in England. But my object is to get at a fair approximate average, such as a Landlord and Tenant can reasonably go upon as the basis of a lease. It is idle to agitate the question, on chemical or any other principles, as to the possibility of growing corn at 5*s.* a bushel, unless you have some ground for showing the possible permanence of such a price. Look where I will, I cannot find the slightest evidence or grounds for it. In referring to these tables I have said nothing of the expenses of transport or shipment to England, for they vary so much, and are so differently stated, that it is almost hopeless to get at anything like accuracy. It is better to face the subject in its simplest shape; and indeed the more it is examined, the better it will be found to bear the light. My belief is, that the turning point will be, not 5*s.* but 6*s.* a bushel: and that that will be the *centre* round which the variations will range. Nor do I think it will be very long before that begins to manifest itself. France has had *two* abundant harvests in succession: it *may* have a third in succession, but this is a very rare occurrence, as the whole history of prices will shew. As soon as she becomes an importer again, the change will be very strongly felt, as the supply we have received this year from thence is an occurrence quite unprecedented, and due solely to the two large harvests that have succeeded the general scarcity which France experienced, more than any other country, in 1847. She has not followed the example of Belgium, but retains her old Corn-law: but that could not protect her *from herself* during the past year. She may thank us for her only market: as we received from France nearly one-sixth of our whole importation.

The great, and legitimate source of relief for seasons of unusual abundance and consequent cheapness, is the Speculation of the market. It operates more naturally and more usefully than all the State-granaries that ever existed. The unreasonable apprehensions at present existing in this country, as to the range of future prices, have completely paralysed it, for this year; as if a year of general abundance—or scarcity—had never happened before. The thing is not new, however: it must never be forgotten that the word '*Panic*' is derived from *Panis*, Bread. *C. Wren Hoskyns.*

Home Correspondence.

Carts again.—"J. D.," invites "J. H." of Salop, to the harvest field, to witness the casualties of carting Oats. Now my lad take care how you load, as the keystick being easy, makes the cart play about a good deal, or you and the load will fall together. Now observe going down the slope, the weight presses heavily on the horse's back; ascending the other way, he is nearly slung up by the load resting backwards; and getting into a rut on the way home, it settles there. We call a council whether the load should be taken off at once, but it is agreed that master shall take the horse's head, and the two men shall hold the load up with their pitchforks, and so we reach the barn, wanting to carry more before the rain; in less than 20 minutes, the two men and master bolster up the cart before and behind, and take the horse out. The men have an extra pint of beer each for their exertions, and we go on with the other cart, but the raves make such a clatter, there is no hearing each other speak. Just as we reach the field, the off wheel runs over a large flint, and jerks out the fore rave on the horse's back! My beautiful horse, so quiet in general, cannot stand this, but sets off kicking like mad, shakes himself out of the harness, and leaves the cart *hors de combat.* We now return to the load in the barn, and find the prop in front has run aside on the slippery floor, let the cart down and broke both the shafts. N.B. For sale two harvest carts, with raves complete; a bargain to "J. H." Apply to—*J. D.*

Cumberland Carts.—"X. Y. Z." says that "L. V. R." has not a perfect cart to recommended; if so, I think it unworthy of the name of a Cumberland cart, as the wright whom we have now working will make a first-rate article for 9*l.* 9*s.* to tilt, and with moveable broad side; shelvings for coals, lime, &c., and also shelving to go all round the cart, for leading hay and corn, and this sum too shall include all the trimmings "X. Y. Z." speaks of. These carts shall hold as much coals, or lime, hay, or corn, as any reasonable person would wish his horse to draw, and as to their durability, I can only say that no carts can be more constantly at work than ours have been, and they are now sound and good after being in use for the last 10 years (of course under going a slight repair occasionally), having led thousands of loads of stones, besides the usual farm work. Some of our carts do not tilt, but we certainly approve of their doing so for many purposes. Their weights run from 5 cwt. 2 qrs. 14 lbs., to 6 cwt. 14 lbs. "J. D." says that nothing gives a lad more trouble than to load a cart with hay or corn; surely he must have been a clumsy fellow, for here lads and women generally load, and a female servant of ours loaded in one day 40 carts of hay, giving over work before 6 o'clock P.M. As to the "accidents and the difficulty of loosing the horse out of a cart you wish to unload afterwards," I can only say that we have met with none of the former yet, and that our men consider it but one person's work to unloose a horse out of a cart, first placing what we call a dead horse within reach previous to loosing out the horse, and then using a little craft as to balancing the cart by means of one of the shafts over his shoulder, whilst replacing the live horse with the dead one. *Cumbrian.*

[Messrs. Handford and Co. are probably sufficiently well known by this time. We have sent your letter to the Manchester Guardian Society.]

Directions as to the Quantities of Guano and Ground Bones necessary for any given space of ground.—As guano and crushed bones are now in general use, and will no doubt become permanent applications, from the experience that has already tested their high utility, the following Tables have been carefully constructed for the purpose of preventing possible waste, and assisting ploughmen and others who have little time for minute calculation. As regards the manures named, the Tables annexed are intended as a sort of ready reckoner, which, by simply leaving out fractional parts, show at a glance how much of each will be required by the yard, drill, rood, or acre, no matter how extensive the fields cleaned and dunged for green crop:

Table, *showing the quantity of Guano required to be sown in a certain number of yards, equal to 1 cwt. to the acre, in Scotch and Imperial Measure, in drills from 36 to 22 inches apart.*

Scotch Statute Measure.			Imperial Standard Measure.		
Distance of Drills in inches apart.	No. of the Lineal Yards in the Scotch Acre.	Length of Yards for lbs. equal to 1 cwt. of Guano.	Distance of Drills in inches apart.	No. of the Lineal Yards in the Imperial Acre.	Length of Yards for lbs. equal to 1 cwt. of Guano.
*36	6104	*54	36	4840	43
35	6278	56	35	4978	44
34	6463	57	34	5124	45
33	6659	59	33	5280	47

I have often thought of sending you the annexed tables, which were prepared for me soon after I first began to use guano, and which I and numerous friends to whom I gave a copy have found most useful. I doubt not that many of your agricultural readers would be thankful for the information they contain, and if you have any wish to publish the tables, I believe the author of them, Mr. W. M'Gowan, Dumfries, will have no objection. *Max, The Grove, Dumfries.*

Farm Estimates.—Under the above title in the *Agricultural Gazette* of the 9th February, there is a paper of much interest by Mr. Hewitt Davis, in which attention is drawn to the great sacrifice on live stock, in proportion to the corn grown, involved in the Scotch 5-course rotation. In the Scotch system, by Mr. Watson's estimate, 200 acres Grass and 100 acres greens, give 800*l.* in increased value of stock, leaving on a 500 acre farm 200 acres for corn crops. Mr. Davis, taking three-fifths of the gross general expenses of the farm, and adding the estimate of 100*l.* given by Mr. Watson to meet loss on stock by disease and accident, shows that the stock stand in 1350*l.*, and being sold at 800*l.*, leave a balance of 550*l.* to be charged against the corn crops, which Mr. Davis considers disproportionately small. To meet this defect, he proposes altering the rotation by giving 250 acres to corn, and 250 to roots; by which means he nearly doubles the money returns of the corn crops, while he also diminishes the balance against stock. Neither of the two rotations implies more than the best common farming; and if the Scotch farmer can adopt the proposal, it certainly holds out promise of more profit than his own. But the point to which I wish to advert, and on which I would gladly see a discussion in the *Agricultural Gazette*, is the great balance by loss on stock which both systems impose upon the corn crops. Leaving the Scotch system, take Mr. Davis's for examination. Now, charging against his stock the same items of account which he has charged against Mr. Watson's stock, we find (without allowing 100*l.* for loss by disease or accident, as Mr. Watson does), that stock kept at a cost of 1125*l.*, produce 750*l.*, leaving a balance of 375*l.* of loss to be deducted from 1684*l.* gross return for corn, making the net return only 1309*l.* Mr. Davis puts Oats at 7 quarters per acre, Barley at 5 quarters, and Wheat at 3½ quarters. Now, but for the loss on stock, which the corn crops have to compensate, 6 quarters of Oats, 4½ Barley, and 2½ Wheat severally per acre, would about give the same net return. It would, therefore seem to be a question worth investigation, whether farmers should not cease to aim at large corn crops got by means of fallow crops which stock cannot pay for; and, on the contrary, content themselves with such an amount of corn per acre, as land kept clean, carefully cultivated, and dressed with the manure resulting from the consumption of the offal only of the farm, either alone or aided perhaps by a small cost of artificial manure, would give; while instead of cultivating roots, they would apply their fallows to Peas and Beans, which admit of hoeing and weeding, and to Vetches and Clover for seed, or hay, or green fodder as facility of sale would determine. These green crops, it is presumed, would, on an average of years, pay their own expenses. Such a system would require much less capital in a farmer and less outlay in buildings by a landlord, and thus in both ways decrease the cost of production; while the products of the farm being multiplied in number, and most of them somewhat lessened in quantity, there would be a better chance of remunerative prices. *A. H. Hall, Watergate, Petersfield, Feb.* 20.

Sour Beer.—I fancy there must be a misprint in your correspondent's communication respecting the acidity of his beer, in regard to the quantity of liquor drawn from four bushels of malt; if is stated correctly, as far as my experience goes, I should consider it wonderful if any beer, of the strength specified, would keep sound any length of time. Let "Cerevisium" add two bushels of malt and a pound or two more Hops, and he may then have a chance of having sound beer for twelvemonths. *Buffer.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Weekly Council was held at the Society's House in Hanover-square, on Wednesday last, the 13th of March: present, Mr. Raymond Barker, Vice-President, in the chair; Sir John V. B. Johnstone, Bart., M.P., Mr. Almack, Mr. French Burke, Dr. Calvert, Mr. Colthurst, Mr. Capel Cure, Mr. Dyer, Mr. Majendie, Mr. C. E. Overman, Mr. Parkins, Mr. Slaney, M.P., Mr. Augustus Smith, Professor Sewell, Professor Simonds, Mr. Reynolds Solly, and Professor Way.

The following new members were elected:

Colston, W. H. Morris, Lydford, Somerton, Somerset
Hamling, Henry, Dean's Prior, Ashburton, Devon
Shaw, John, Beddington Lodge, Croydon, Surrey
Pedler, John, Baron's Wood, Zeal-Monachorum, Crediton
Burnett, Alexander, Merton, Crediton, Devon
Farthing, S., Stowey-court, Nether-Stowey, Bridgewater
Chilcott, Rev. Wm. Francis, Rectory, Monksilver, Taunton
Heseltine, Samuel Richard, Chase Side, Enfield, Middlesex
Counsell, W., St. Mary Church, Torquay, Devon
Palk, Lawrence, Haldon House, Exeter
Moon, John, Laxford, Crediton, Devon
Clarke, Thomas, Tremlett House, Wellington, Somerset
Morse, Arthur, Swaffham, Norfolk
Carter, Henry, Milton House, Pembridge. Leominster
Clare, Charles Leigh, Hindley House, Liverpool
Abrey, T. Shaw Hellier, Nether Hall, Bradfield, Manningtree
Hanbury, Sampson, Bedford-lane, Clapham.

The names of 10 candidates for election at the next meeting were then read.

Thibetian Sheep.—Colonel the Hon. C. B. Phipps communicated to the Council, on the part of H.R.H. Prince Albert, further information connected with her Majesty's flock of Thibetian Sheep at Osborne; which was received with the best thanks of the Council, and referred to the Journal Committee.

Warmth and Ventilation.—M. Noirsain, the inventor of the Belgian Fire-place presented to the Society, requested leave to postpone the presentation of his Report on its operation, until his arrangements for its adaptation, and the experiments he had in progress connected with its action, should be completed. —Mr. Slaney, M.P., took that opportunity of referring to a very simple, economical, and effective mode of warming the upper chamber of cottages, and the store-rooms connected with stables, coach-houses, granaries, and other outbuildings, which he had adopted on his own estate with great comfort to his cottagers and advantage to the store articles contained in those rooms. Having remarked that in building a cottage with the fire-place in the outside wall all warmth from the back part of the fire was carried off by the external air and lost to the inmates, he had tried the experiment of placing the chimneys of his cottages in the mid-wall dividing two of their rooms, one the kitchen, the other the wash-house or scullery. In building the chimney he had a small hollow recess, forming an air-chamber, left in the wall at the back of the kitchen chimney, into which the external air was introduced, by means of a flue of common drain-pipe tiles, 2 inches wide, placed under the floor; and becoming heated by the fire, it passed on continuously by means of a small aperture into the back adjoining room, and conveyed into it a warm, fresh, and uncontaminated atmosphere. The room was thus constantly kept moderately warm and dry, and the wet shoes and clothes of the labourer being hung in a row during the night on pegs placed above the aperture, were made perfectly dry for his use by the next morning. The upper rooms could also, at any time, be warmed from the same source, by temporarily closing the aperture of the flue leading to the adjoining lower room, and leaving a half-brick flue open above the air-chamber into either of the upper rooms, the lower opening being always shut for the time the upper one was kept open. The cost of this arrangement was very trifling, and the comfort great. —Sir John Johnstone had employed a similar plan in his cottages, in Yorkshire; but he had constantly found the apertures for the admission of the warm air into the chambers adjoining those in which the fire was placed, as carefully closed up as a draught of cold air would be in ordinary cases, the occupiers having a prejudice or dislike to a mode of warming their rooms in which the source of heat was not immediate and obvious. He had seen a very agreeable and effectual mode of warming large bodies of ascending air, as in halls, vestibules, staircases, and galleries, where there was a free passage for the ascent or outlet of the warm air, by means of an iron pillar formed of a double cylinder, open at the bottom and throughout along the line of their common axis, but closed by the junction of their upper edges, placed above a ring of jets of burning gas laid on from the street.—Mr. Majendie, Prof. Sewell, and Prof. Way also favoured the meeting with remarks on the subject of warming and ventilating rooms.

South-Devon Cattle.—Mr. John F. P. Phillips, of Broomborough, as Secretary and Treasurer to the Local Committee of the South-Devon Association, transmitted to the Council the acquiescence of that committee in the suggestions offered to them by the Council at their last monthly meeting, in reference to the prizes which that Association wished to offer for South-Hams cattle at the Exeter meeting, under the 18th regulation of the Prize-sheet. The following is accordingly the schedule of prizes to be adopted for that occasion, the competition to take place, as in the case of the other prizes for that meeting, subject to all the rules and regulations of the Society:

South-Devon, or South-Hams Cattle.

Class 1.	To the owner of the best bull, calved previously to the 1st January, 1848	£20
	To the owner of the second best do. do.	10
Class 2.	To the owner of the best bull calved since the 1st January, 1848	10
	To the owner of the second best, do. do.	5
Class 3.	To the owner of the best cow, in-calf or in milk, having produced a living calf within the previous 12 months ...	15
	To the owner of the second best do. do.	5
Class 4.	To the owner of the best in-calf heifer, not more than 3 years old	15
	To the owner of the second best do. do.	5
Class 5.	To the owner of the best yearling heifer	10
	To the owner of the second best do. ...	5
		£100

Mr. Phillips further communicated the following suggestion, on the part of the South-Devon Association, namely, "That any person exhibiting in these classes shall be required to sige a certificate, that the animal exhibited is directly descended from South-Hams cattle." The Council referred this suggestion to their General Exeter Committee, which they directed to be summoned for that day week.

Armenian Wheat.—Professor Lindley favoured the Council with a specimen of Wheat grown at Erzeroom, on Mount Ararat, and with a communication from James Brant, Esq., H. M. Consul at that place, relating to its cultivation. The seed had been obtained from Trebizond, and the variety was supposed to be that of the Triticum compositum. The Council ordered their thanks to be sent to Dr. Lindley for the favour of this communication. The presentation of this Wheat led to a discussion on the produce of Wheat grown under different circumstances, and on the relation between the produce per acre and average number of grains in a single Wheat-ear of the crop.—Mr. Slaney gave an interesting detail of his cultivation of a piece of very bad land, in Shropshire, which by draining and subsoiling had now, for the first time, borne Turnips, and the best crop of Barley in that part of the country. He particularly dwelt on the peculiar advantage to be derived from *subsoiling*, in addition to draining and general cultivation. —Sir John Johnstone had employed Wilkie's plough across the drains with great advantage.—Mr. Overman and Mr. Slaney favoured the members with the result of their experience in the use of Garrett's horse-hoe and its adaptation to their respective purposes; although Mr. Slaney conceived that improvement was still required in the means for hoeing Wheat.—Mr. Dyer had, in his own case, observed for the last 10 years a curious law to hold in the ratio between the average number of grains of Wheat in a single ear of the crop, and the number of bushels in the produce, each such grain in the ear being correspondent to a bushel per acre in the produce when threshed out. In his crops the average number of grains in the ear had been 28, while the bushels per acre produced had also been 28. He did not mean to express his belief in the generality of such law, but he merely referred to it as a curious case occurring within his own observation.—Mr. Barugh Almack entirely concurred with Mr. Slaney in his remarks on the advantages of subsoiling and draining; and he had every reason to think highly of Mr. Garrett's horse-hoe. With regard to Mr. Dyer's interesting statement on the correspondence between the number of grains in the ear and the number of bushels per acre, he thought the fact must be taken as a singular case under given limitations and conditions. He conceived, to obtain a correct general result, that not only should the average number of grains in each individual ear be taken, but also the number of ears themselves in a crop; otherwise the rate of bushels per acre would be dependent on the size of the ear, and irrespective of the total number of the ears, which might easily be shown to lead at once to incorrect conclusions. He thought that, assuming in some cases the rule to hold good as to there being as many bushels of Wheat per acre as there are grains in an average ear, yet that it was quite clear no additional number of grains per acre could make up for the fact of the ears being as wide apart as Apple trees, for instance, usually are; and accordingly that the rule could not be relied on in extreme cases of thin sowing. He had alluded to an extreme case, in order that the fallacy of the rule might, in some cases, be made more obvious. Mr. Dyer had remarked that he sowed 3 bushels per acre; consequently, in Mr. Almack's opinion, Mr. Dyer's case proved two remarkable facts: 1. That as he generally finds as many bushels per acre as there are grains in an average ear, it follows that he usually has about as many Wheat ears per acre as there are grains in a bushel of Wheat; 2. That as he only obtains as many ears of Wheat per acre as there are grains of Wheat in one bushel, although he sows 3 bushels per acre, it seems that he sows three grains of Wheat for each ear that he obtains. He thought that something similar had been stated by one of the advocates for thin sowing, and he had no doubt it would be a very interesting matter for consideration if all would reflect on it with due caution, and without taking it for more than it proves. Mr. Almack would not at that time offer an opinion as to the question of thick or thin sowing. Although he thought that some experienced farmers would at once, on seeing the crop, give a better guess at the number of bushels per acre than any one could do by merely counting the grains in an average ear, he was still glad to learn from Mr. Dyer the singular law which he had found to hold good in his own case. He conceived that practical farmers would always be desirous of having their attention drawn to similar facts; it was only necessary that inexperienced farmers should be cautioned against the probability of the rule holding good in all cases. He would endeavour to show in another form that the rule in question could only be fairly expected to hold good where the number of ears per acre are the same, or nearly so. He would suppose that a given acre of land was accurately measured and divided into two equal parts, and that on one of these parts there are 30 ears of Wheat, each containing 40 grains, the total produce would be 1200 grains; on the other part, 40 ears containing 30 grains, of which the total produce would also be 1200 grains: and as in both cases the quantities of land were equal, the produce per acre would in each case be the same, unless we assume the grains to vary in size. Mr. Almack concluded by observing, that if we suppose these last cases to represent two fields occupied by different farmers, he thought it obvious that if one expected to have 10 bushels per acre more than his neighbour, he would be disappointed.

Communications were received by the Council, from Mr. Warry on drainage, covenants, and agricultural education; from Mr. Loomes on Prizes; and from Mr. Fulbrook on Meteorology.

Prof. Spooner and Prof. Morton, of the Royal Veterinary College, made presents to the Society of their respective works; the former of a copy of his introductory Lecture on Veterinary Science; and the latter of copies of his works on Veterinary Pharmacy and Calculous Concretions, and of his Veterinary Toxicological Charts. Mr. Roberts presented a copy of his work on the Dwellings of the Poor. For all which, and other presents made to the Society, the Council ordered their best thanks.

The Council then adjourned to their weekly meeting on that day fortnight, Prof. Way's Lecture being fixed for that day week, the 20th inst., at 12 o'clock.

Miscellaneous.

Conclusion on Meat-making.—That box-fed or shed-fed animals of good breed, fed on purchased food properly prepared, in addition to the utmost produce of the best grown crops which a thorough fertile farm can yield, will turn out more meat per acre than is possible by any other animals under any other circumstances. That land must be raised to the highest fertility which the cost of drainage or burning, or marling or liming, of manuring and cultivation, permits—that it must then be made to yield alternately with grain crops, the best descriptions of Swedish and other Turnips, of Mangold Wurzel, of Carrots, of Clover, Vetches, Rape, or other green crops, which skilful cultivation can produce, and the best crops of each that cost and climate allow : that, with this produce, Linseed and, say, Beans, must be bought (or grown) for consumption in the proportion of 1 of the former, and about 3 of the latter, with every 100 of the green food : that this, properly prepared, must be given to good individuals of the short-horn, Hereford, or Devon breeds of cattle, kept in clean, well-littered boxes, or to good individuals of the Leicester, South Down, long-woolled, or cross-bred breeds of sheep, in well-littered and well-sheltered sheds, before a maximum of meat can be expected. *English Agricultural Society's Journal.*

Varieties of Barley.—The different varieties of Barley comprise the old common Barley, Chevalier, Brewers' Delight, Oakley, American, Nottingham Long-ear, Berkshire, &c. The Chevalier decidedly ranks first for malting purposes, and is most eagerly sought after by the brewer in every district. The objections urged against it are, that it does not produce so much per acre as some of the other varieties. I am, however, inclined to think that, under proper cultivation and with occasional change of seed, there are few sorts that can be compared with it. I will give the result of some experiments carefully tried between 1836 and 1845 :

	Corn.		Straw.		
In 1836.	Bush.	pecks.	Tons.	cwt.	lbs.
Chevalier	42	0	0	14	1
Common Barley	42	0	0	15	6
American	40	0	0	14	4
1841.					
Brewers' Delight	57	1	1	6	6
Berkshire	56	2	1	6	2
Chevalier	60	1	1	7	6
Nottingham	56	3	1	8	0
1845.					
Brewers' Delight	52	0			
Chevalier	48	3			

H. W. Keary in the English Agricultural Society's Journal.

The Business of Landowners.—Landlords generally, even those of the highest class in the empire, might do well to taken a lesson from the example of Lord Lucan. He has not thought it beneath his station to acquire an intimate practical knowledge of his own business—the management of his estate. The want of this essential requisite to the profitable ownership of land, has done more to retard the agricultural advancement of the country than can well be calculated. It has led to the very general appointment of a class of agents unqualified by previous education for the important duties they ought to perform. It has exhibited an unreasoning jealousy towards prosperous farmers, whose exertions, instead of being encouraged, are only regarded as a source of increased rent. It has crushed, by culpable negligence, the efforts of the industrious tenant, willing to struggle against adverse times, if only fairly met by a considerate landlord. It forms the true solution of the different success which distinguishes the commercial and manufacturing capitalist from the great landlord. The first makes his business a study, and developes it to the utmost ; the last too often thinks it beneath his notice, and trusts it to persons who are frequently as ill qualified for its duties as himself. *The Plantation Scheme, by Mr. Caird.*

Calendar of Operations.

MARCH.

East Lincolnshire Farm, *March* 8.—Seed time has commenced under most favourable circumstances, and there is reason to hope for a continuance of the fine dry weather we at present enjoy. We are now busy sowing our Barley on seed land and Wheat stubble (manured), reserving the Turnip land for Oats, as they generally succeed better here, after Turnips, than the Barley. The land having been well frosted in winter, works as fine as a garden. Turnips have been very plentiful with us, as well as in most of Lincolnshire, there being in some districts more than could be consumed ; they have on this farm probably averaged a weight of 30 tons to the acre, and it will be the latter end of this month before we shall get through them. The time has now arrived for our most forward ewes to lamb ; they and the hogs were all dipped last month, and, with the exception of the latter being rather crippled in the feet, probably from the change of weather from wet and snow to extreme dry, are healthy and in good condition. During the severe frosts which we experienced here in winter, when prevented from ploughing and threshing, we were employed manuring the Turnip fallows, which, with us, is always performed at that season, in preference to doing it just before the time for sowing Turnips arrives, by which means the manure gets well incorporated with the soil, and it is all ready for the Turnips in summer without any hurry at that period ; by the other method the seed must be some time before it gains any benefit from the manure, when put on the land hastily, just before sowing. In conclusion, our work next week will be drilling Barley, threshing Oats for seed ; and, through the month, ploughing for and drilling Oats, sowing Grass seeds on the Wheat. *H. E.*

Notices to Correspondents.

Artificial Manures : *J S F.* We do not know them. See a notice at page 152, to "O. P. W." We should be delighted to have your account of Caithness farming.

Calf, Tickling Cough in : *J H.* The cough is probably from the presence of small worms in the windpipe, and the disease is commonly termed hoose. Give oil of turpentine, 1 oz. ; oil of linseed, ½ oz. ; oil of aniseed, 10 drops, well mixed and shaken together, every week till the evil is removed. *W. C. S.*

Estate Agency : *C N E.* We know of no published estate agency accounts. See article "Agent" in Blackie's "Cyclopedia of Agriculture." We are not acquainted with the agricultural literature of France.

Food for Laying Hens : *A Lady.* If they have the range of a field, they will need but little food. In one case 60 fowls, 8 or 9 months old, were kept during winter in a room, and separately fed, solely on corn. They consumed 6 quarts daily of mixed Indian Corn, Oats, and Buckwheat.

Grass Seeds : *Constant Reader* and *V A N.* For a permanent pasture on medium soils, sow per acre, with a crop of Barley, Aira cæspitosa lutescens, 1 lb. ; Alopecurus pratensis, 1½ lb. ; Arrhenatherum avenaceum, 1 lb. ; Avena flavescens, ½ lb. ; Dactylis glomerata, 2 lbs. ; Festuca duriuscula, 3 lbs. ; F. heterophylla, 1 lb. ; F. loliacea, 1 lb. ; F. pratensis, 2 lbs. ; Lolium italicum, 3 lbs. ; L. perenne, 5 lbs. ; Phleum pratense, 1 lb. ; Poa nemoralis, 3 lbs. ; P. trivialis, 1 lb. ; Trifolium pratense perenne, 3 lbs. ; T. repens, 4 lbs. ; total, 33 lbs. In the case of very light soils, the 1st, 3d, 8th, 9th, 12th, and 14th of these may be omitted, and 2 lbs. of Festuca rubra, 1 lb. of Poa pratensis, and 1 lb. of Medicago lupulina added in their stead.

Guano : *A Novice.* Mix 3 cwt. of it per acre with a lot of mould, free from the seeds of weeds, and spread it broadcast over the Grass towards the end of this month.

Hydro Incubator : *E B H.* The discussion on this subject last year ended unfavourably to the invention. The difficulty is not in hatching, but in rearing the chickens.

Highland Tenantry : *A W.* We have not the honour of acquaintance with Dr. M'Kenzie.

Liquid Manure : *Cumbrian.* We think you might lay pipes for an acre or two close around the stalls, economically. If any one would give us their experience of cost, we should be much obliged.

Mangold Wurzel : *Housekeeper.* The root is changed during and after sprouting. It loses much of its most valuable part.

Oats : *Scotus* inquires if any varieties are considered particularly adapted for human food or horse feed respectively. The Black Tartarian is a large coarse variety—filling the bushel rapidly. [Your question has been forwarded to a competent judge.]

Shed Feeding Sheep : *Friday.* The end of a barn would do very well for the experiment. The manure should be removed from below the sparred framework ; when it becomes offensive, that period may be delayed by the use of sprinkled gypsum over the floor.

Small Farm : *New Forest.* You will probably make the largest money produce from the land by the sale of vegetables ; next by the sale of milk, butter, and eggs. If the latter be the method adopted, then your land should be devoted to the growth of Cabbages and Mangold Wurzel on the clayey part ; Italian Rye-grass, Rape, and Vetches on the light land. You may grow 30 to 40 tons per acre of green food per annum by constant cropping. A cow will eat from 25 to 35 tons of green food in the year.

Storms : *A Correspondent* asks if any meteorological observers in the north of England will be good enough to consult their notes of the weather of 1846, and especially any record they may have of a storm which traversed the east and north of England on the afternoon of Saturday, April 25th in that year. He would be much obliged for information regarding the course and intensity of that storm.

Threshing Machine : *Devon.* There was a mistake. The threshing drum revolves 1000 times in a minute, and its circumference is about 5 feet, so that it should be 5000 not 50,000 feet per minute. This is not too great a velocity. Cole and Rape seed are names given indifferently to the same thing. They should be confined, the former to a variety whose leaves are rough when young, and the latter to a variety always smooth leaved. You cannot sow Rape along with the Wheat in May, with any prospect of a satisfactory result.

Turkeys : *Constant Reader.* We give the following extract from Mr. Dixon's work on Poultry ; "When the hen has once selected a spot for her nest, she will continue to lay there till the time of incubation, so that the eggs may be brought home from day to day, there being no need of a nest egg, as with the common fowl. She will lay from 15 to 20 eggs, more or less. If there are any dead leaves or dry Grass at hand, she will cover her eggs with these ; but if not, she will take no trouble to collect them from a distance. Her determination to sit will be known by her constantly remaining on the nest, though empty ; and as it is seldom in a position sufficiently secure against the weather or pilferers, a nest should be prepared for her by placing some straw, with her eggs, on the floor of a convenient outhouse. She should then be brought home and gently and kindly placed upon it. It is a most pleasing sight to witness the satisfaction with which the bird takes to her long-lost eggs, turning them about, placing them with her bill in the most suitable positions, packing the straw tightly around and under them, and finally sinking upon them with the quiet joy of anticipated maternity. In the south of England from 15 to 20 eggs may be allowed ; but with the Norfolk variety, which is the smallest, and in a northern or eastern county, it is found that moderation succeeds better than over-greediness of chicks. In this case 13 eggs are enough to give her ; a large hen might cover more ; but a few strong, well-hatched chicks are better than a large brood of weaklings that have been delayed in the shell, perhaps 12 hours over the time, from insufficient warmth. At the end of a week it is usual to add two or three fowls' eggs, 'to teach the young Turkeys to peck.' The plan is not a bad one ; the activity of the chickens does stir up some emulation in their larger brethren ; the eggs take but little room in the nest ; and at the end of the summer you have two or three very fine fowls, all the plumper for the extra diet they have shared with the little turkeys. Some ladies believe it necessary to turn the eggs once a day ; but the hen does that herself many times a day. If the eggs are marked, and you notice their position when she leaves the nest, you will never find them arranged in the same order. A person who obtained 99 chicks from 100 eggs, took the trouble to turn every egg every day with her own hand, during the whole time of incubation. The result *appears* favourable ; but, in fact, only amounts to this, that such officiousness did no harm with such a good, patient, quiet creature as the sitting Turkey is, but it would probably have worried and annoyed any other bird into addling her whole clutch. We will at once reject, as utterly absurd and unnatural, all directions to immerse or 'try' the eggs in a pail of water, hot or cold. In four weeks the little birds will be hatched ; and then, how are they to be reared ? Some books tell you to plunge them in cold water, to strengthen them : those that survive will certainly be hardy birds. Sir J. S. Sebright exposes the folly of endeavouring to make young creatures robust by undue exposure to cold and hardship, an experiment which some men and women are cruel enough to try upon their own offspring. Air and exercise increase the strength of any growing animal, but cold and hunger only dwarf and weaken. We see robust children in extremely poor families, not because they are poor, but because, if they were not robust, they would not be alive at all. Sir John, in his 'Treatise on Improving the Breeds of Domestic Animals,' pp. 15, 16, says : 'In cold and barren countries no animals can live to the age of maturity but those that have strong constitutions ; the weak and the unhealthy do not live to propagate their infirmities, as is too often the case with our domestic animals. To this I attribute the peculiar hardiness of the horses, cattle, and sheep, bred in mountainous countries, more than to their having been inured to the severity of the climate ; for our domestic animals do not become more hardy by being exposed, when young, to cold and hunger ; animals so treated will not, when arrived at the age of maturity, endure so much hardship as those who have been better kept during their infant state.' Others say, 'Make them swallow a whole pepper-corn ;' which is as if we were to cram a London pippin down the throat of a new-born babe. Others, again, say, 'Give them a little ale, beer, or wine.' We know, unhappily, that some mothers are wicked enough to give their infants gin, and we know the consequences. Not a few advise that they be taken away, and kept in a basket by the fire-side, wrapped in flannel, for eight or ten hours. Why take them away from her ? She has undergone no loss, or pain, or labour : she wants no rest, having had too much of that already. All she requires is the permission to indulge undisturbed the natural exercise of her own affectionate instinct. Give them nothing ; do nothing to them : let them be in the nest under the shelter of their mother's wings at least eight or ten hours ; if hatched in the afternoon, till the following morning. Then place her on the Grass, in the sun, under a roomy coop. If the weather be fine, she may be stationed where you choose, by a long piece of flannel list tied round one leg, and fastened to a stump or a stone. But the boarded coop saves her ever-watchful anxiety from the dread of enemies above and behind—the carrion-crow, the hawk, the rat, the weasel ; and also protects herself (she will protect her young) from the sudden showers of summer. Offer at first a few crumbs of bread : the little ones for some hours will be in no hurry to eat ; but when they do begin supply them constantly and abundantly with chopped egg, shreds of meat and fat, curd, boiled Rice mixed with Cress, Lettuce, and the green of Onions. Melted mutton-suet poured over Barley-meal, and cut up when cold ; also bullock's liver boiled and minced, are excellent things. Barley-meal, mixed thick and stiff with water or milk, Nettle-tops, Leeks, Goose-grass, or Cleavers, and many other things, might be added to the list ; but it is probable that a few of these may now and then be refused by some fanciful little rogues. I think I have observed that little Turkeys do not like their food to be minced much smaller than they can swallow it ; indolently preferring to make a meal at three or four mouthfuls to troubling themselves with the incessant pecking and scratching in which chickens so much delight. But at any rate, the quantity consumed costs nothing ; the attention to supply it is everything."

Wattled Hurdles : *H C W.* Your question is properly the subject of an advertisement.

Wheat Hoeing : *O N R.* You may commence early in April. It is possible to be too early, because a sudden relapse to wintry weather would nullify the operation of loosening and stirring the land.

Markets.

COVENT GARDEN, March 16.

Notwithstanding the coldness of the weather, Vegetables continue to be plentiful, but many kinds of Fruit are still scarce. A few new Hothouse Grapes have made their appearance. Pine-apples, though far from being plentiful, are nevertheless sufficient for the demand. Walnuts and Chestnuts are abundant ; of the former we observed some fine examples from Naples. Oranges and Lemons are sufficient for the demand. Amongst Vegetables, Turnips and Carrots are good, and there is some fine Cornwall Broccoli in the market. Potatoes are unaltered since our last account. Lettuces and other salading are sufficient for the demand, and so are Mushrooms. French Beans, Asparagus, Seakale, and Rhubarb may be obtained at about last week's prices. Cut Flowers consist of Heaths, Pelargoniums, Bignonia venusta, Primulas, Camellias, Cinerarias, Christmas Roses, Azaleas, Lilacs, Lily of the Valley, Epacrises, Acacias, and Roses.

FRUITS.

Pine-apples, per lb., 6s to 10s	Almonds, per peck, 6s
Grapes, Portugal, p. lb., 9d to 1s	— sweet, per lb., 2s to 3s
Pears, per doz., 6s to 10s	Walnuts, p. 100, 1s 6d to 2s
Apples, kitchen, p. bsh., 4s to 6s	— p. bush., 16s to 24s
Lemons, per doz., 1s to 2s	Nuts, Bar., p. bush., 20s to 22s
— per 100, 6s to 12s	— Brazil, p. bsh., 12s to 16s
Oranges, per doz., 9d to 1s 6d	Kent Cobs, 90s to 100s p. 100 lbs
— per 100, 5s to 12s	

VEGETABLES.

French Beans, per 100, 3s to 4s	Carrots, per bun., 4d to 6d
Seakale, per punnet, 1s to 2s	Spinach p. sieve, 2s to 3s
Asparagus, p. bund., 2s to 7s	Onions, p. bushel, 3s 6d to 4s 6d
Rhubarb, p. bundle, 6d to 1s	— Spanish, p. doz., 1s 6d to 4s
Savoys, per doz., 6d to 9d	Shallots, per lb., 4d to 8d
Cauliflowers, p. doz., 1s to 4s	Garlic, per lb., 4d to 8d
Broccoli, p. doz. bundl., 8s to 10s	Lettuce, Cab., p. sc., 4d to 9d
Greens, per doz., 2s to 3s	Endive, per score, 1s 6d to 3s
Brussels Sprouts, p. hf. sieve, 1s 6d to 2s	Mushrooms, p. pot., 9d to 1s
Sorrel, p. hf. sieve, 1s to 2s	Small Salads, per punnet, 2d to 3d
Potatoes, per ton, 60s to 120s	Watercress, p. 12 bun., 6d to 9d
— per cwt., 3s to 7s	Fennel, per bunch, 2d to 3d
— per bush., 2s 6d to 3s 6d	Savory, per bunch, 2d to 3d
Turnips, p. doz. bun., 1s 6d to 2s 6d	Thyme, per bunch, 2d to 3d
Red Beet, per doz., 9d to 1s	Parsley, p. doz. bun., 2s to 3s
Horse Radish, p. bdl., 1s to 4s	— Roots, p. bdle., 9d to 1s
Cucumbers, each, 3s to 5s	Marjoram, per bunch, 2d
Leeks, per bunch, 1d to 1½d	Mint, green, per bunch, 9d to 1s
Celery, p. bundle, 8d to 1s 3d	Corn Salad, p. hf. sieve, 9d to 1s

POTATOES.—Southwark, March 11.

The Committee report that the arrivals from the Continent continue to be very extensive, much beyond the demand, consequently many are obliged to be stored. Trade is very heavy, and it is with difficulty the following prices have been obtained : York Regents, 80s. to 100s. per ton ; Wisbeach do., 60s. to 80s. ; Scotch do., 60s. to 70s. ; Scotch cups, 60s. to 70s. ; French whites, 60s. to 70s. ; Belgian do., 55s. to 60s. ; Rhenish do., 50s. to 55s.

HOPS.—Friday, March 15.

Messrs. Pattenden and Smith report that theer is more doing in Hops, particularly in fine yearlings.

HAY.—Per Load of 36 Trusses.

Smithfield, March 14.

Prime Meadow Hay	66s	to 72s	Clover	60s	to 80s
Inferior ditto... ...	50	63	New Clover	—	—
Rowen	50	60	Straw	23	28
New Hay	—	—		J. Cooper.	

The supply short, but trade very slow.

Cumberland Market, March 14.

Prime Meadow Hay	68s	to 72s	Inferior	60s	to 70s
Inferior ditto... ...	50	63	New Clover	—	—
New Hay	—	—	Straw	24	28
Old Clover	75	84		Joshua Baker.	

Whitechapel, March 14.

Fine Old Hay ...	68s	to 68s	New Clover	—s	to —s

SMITHFIELD, Monday, March 11.

We have rather more Beasts than on Monday last, although the supply falls short of what was expected. Trade is very dull, and late prices are with difficulty maintained for the choicest kinds. The number of Sheep is larger, but the quality generally middling ; the best Downs, consequently, are readily sold ; trade is, however, slow for other descriptions. Trade is heavy for Calves ; the supply is not excessive, they are, there-

fore cleared off, but at no higher prices. From Holland and Germany we have 138 Beasts, 380 Sheep, and 66 Calves; from France, 200 Sheep; from Spain, 28 Beasts; from Scotland, 500; from Norfolk and Suffolk, 2100; and 300 from the midland counties.

Per st. of 8 lbs.	s	d	s	d
Best Scots, Herefords, &c.	3	6	to 3	8
Best Short-horns	3	4	— 3	6
2d quality Beasts	2	6	— 3	0
Best Downs and Half-breds	4	0	— 4	4
Ditto Shorn	...	...	...

Ditto Shorn	...	...		...
Lambs	...	...	...	— ...
Calves	...	...	3	4 — 4 4
Pigs	...	...	3	0 — 4 0

Beasts, 3600; Sheep and Lambs, 20,200; Calves, 108; Pigs, 185.

FRIDAY, March 15.

The supply of Beasts is as large as of late, owing to a considerable arrival of foreign cattle; the number fresh up from our own grazing districts is smaller. The trade is exceedingly heavy, and Monday's quotations cannot on the average be supported. Although the number of Sheep is not large, it exceeds the demand, and late prices are with great difficulty realised. Only small choice Lamb is saleable, and these barely make 6s. per 8 lbs. Trade is very slow for Calves, and Pigs at about late rates. From Holland and Germany there are 241 Beasts, 280 Sheep, and 132 Calves; from France, 100 Sheep; from Scotland, 200 Beasts; from the midland counties, 150; and 115 Milch Cows from the home counties.

Per st. of 8 lbs.	s	d	s	d
Best Scots, Herefords, &c.	3	6	to 3	8
Best Short-horns	3	2	— 3	4
2d quality Beasts	2	4	— 3	0
Best Downs and Half-breds	4	0	— 4	4
Ditto Shorn	...	...	—	...

Per st. of 8 lbs.	s	d	s	d

Calves	...	...	3	4 — 4 4
Pigs	...	...	3	0 — 4 0

Beasts, 906; Sheep and Lambs, 3320; Calves, 240; Pigs, 205.

MARK LANE.

MONDAY, MARCH 11.—The supply of Wheat from the neighbouring counties this morning was small, and disposed of at about the same prices as this day se'nnight. The demand for foreign was extremely limited, and in the few sales effected rather less money was accepted. — Fine English malting Barley is unaltered in value, but inferior and foreign are almost unsaleable.—Beans and Peas are a slow sale, the former at 6d. to 1s. per qr. decline.—The Oat trade is exceedingly heavy, and late rates barely obtainable.

FRIDAY, March 15.—The supplies of English grain during the week have been small, those of foreign moderate. This day's market was thinly attended, and a general indisposition evinced for business in corn of all kinds. Prices of each description may be considered nominally the same as on Monday. —Throughout the kingdom the same dulness has prevailed in the corn trade during the last week which has characterised it for some time past, and the tendency of prices for all descriptions continues rather in favour of the buyer. In Dantzic and Konigsberg prices of grain remain nominally the same. In Stettin no arrivals from the interior have yet come forward, and holders of Wheat continue unwilling to submit to a sacrifice; two or three cargoes of Rye have been purchased for Ireland, at 17s. to 17s. 6d. per qr., f.o.b. In the lower Pomeranian and Mecklenberg ports the lightness of stocks and short supplies of Wheat have prevented any decline in prices. In Hamburg and Altona the arrivals of Wheat are only adequate to the consumption in those cities, and its value is consequently maintained. In Antwerp prices of Wheat are a shade lower. The French markets are heavy, but we do not observe any reduction in the price of Wheat and Flour. Prices of Wheat in the Dutch markets have receded 1s. per qr.

LIVERPOOL, TUESDAY, MARCH 12.—Scarcely any variation occurred in prices during the past week, but the demand has still been without the slightest animation, and purchases only made as pressing necessity required. There was an improved demand for Indian Corn, at Friday's decline of 6d. per qr. All kinds of Wheat were 1d. per bushel cheaper than on this day se'nnight. Good brands of American Flour supported late value. There was a decline of 1s. per qr. on Beans and Peas, and 1d. per bushel on the lower quality of Oats.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses when completed charged from 1s. 3d. to 1s. 6d. per superficial foot, according to size and quantity; on one principle, the roof is formed without wood or putty, and on another principle with wood rafters and the glass put in with putty. Patent Sashes, requiring no paint, from 7d. to 9d. per ft.

HEATING BY HOT WATER.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING

Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

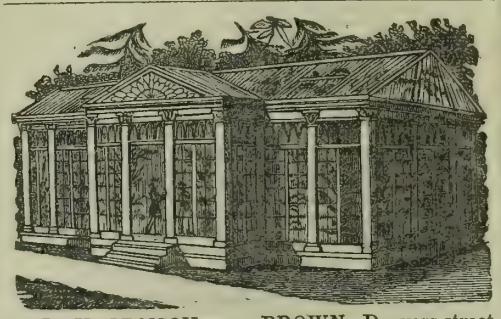
*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.



NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

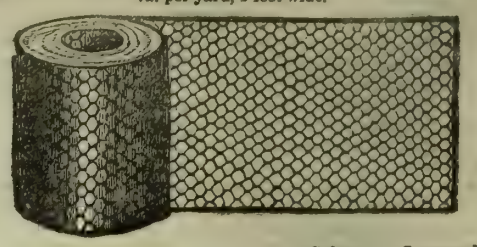
Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

WIRE STRAND FENCING, as fixed by R. S. NEWALL and Co., is cheaper, stronger, more durable and elegant than any other Fence hitherto introduced.

COPPER WIRE HOTHOUSE SASH LINE.
LIGHTNING CONDUCTORS.
GILT AND PLATED CORD FOR HANGING PICTURES.

Office, 130, Strand, London; Warehouse, Brunswick-street, Blackwall; Manufactory, Gateshead, on Tyne.

GRAY, ORMSON, AND BROWN, Danvers-street, Chelsea, solicit the attention of the Nobility, Gentry, and Gardeners, to their superior manner of Erecting and Heating every description of Building connected with Horticulture. The work done by them at the Right Hon. the Earl of Kilmorey's, to which they have had the honour of referring so long, still continues to give perfect satisfaction. Mr. Kinghorn will be happy to show the work and give any information.



They also beg to refer to the houses built by them during the past season, for the Worshipful Apothecaries' Company of London, in their Botanic Garden at Chelsea. Mr. Moore, the Curator, will kindly show the work, and answer any enquiries. They beg also to say the Building only is referred to, as the Heating Apparatus was not erected by them.

GRAY, ORMSON, and BROWN have also the honour of referring to many of the nobility and gentry in the country, and to several of the London Nurseries.

N.B. Plans and Estimates furnished free.

NOTICE. — One Hundred packets of FLOWER SEEDS for 5s., 50 for 3s., or 32 for 2s. 6d., sent free by post on receipt of Money Order. The Advertiser, having a very large Collection of really new and genuine Seeds, begs to offer them at the above very moderate prices; a small packet of 12 kinds will be sent for 12 stamps. A List of Flower Garden and other Seeds, with a sample packet, may be had for two stamps, from which the selection may be made. Also packets of Garden Seeds, free to any railway station in London, at 5s., 10s., 15s., and 20s. each.—Address JOSEPH GOLDING, Seedsman, Hastings, Sussex.

GALVANISED WIRE GAME NETTING.—7d. per yard, 2 feet wide.

		Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide	...	7d. per yd.	5d. per yd.
2-inch " strong	...	9 "	6½ "
2-inch " extra strong	...	12 "	9 "
1⅝-inch " light	...	8 "	6 "
1⅝-inch " strong	...	10 "	8 "
1⅝-inch " extra strong	...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3d. per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

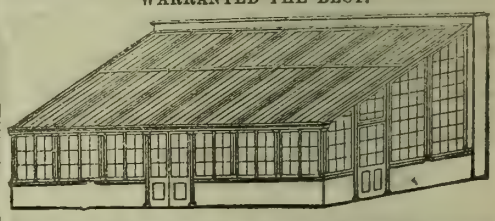
IMPORTANT TO AGRICULTURISTS.—COLLECTION AND DISTRIBUTION OF MANURES.

STRATTON'S AGRICULTURAL REPOSITORY, BRISTOL.

STRATTON, HUGHES, AND CO., have now ready their PATENT TUMBLER CART for the collection of Night-soil and other offensive matters; also their Iron Mill, to be worked by horse-power, water-power, or steam, for mixing and incorporating Nightsoil with Charcoal and other deodorisers. The Tumbler Cart has an iron body with a close cover; can be fitted if required as a Watering-cart, with a Valve and Delivery Pipe for distributing water or liquid manure, and also with an Apparatus for distributing dry manures in any given quantities per acre.

STRATTON, HUGHES, and Co.'s Tumbler Carts are used for scavenging purposes in Manchester, Bristol, Worcester, Harwich, Rochford, Cardiff, &c., and they are now building them for Chester, Oxford, Huddersfield, &c., besides many for Agricultural Colleges and private individuals. STRATTON, HUGHES, and Co.'s new illustrated Catalogue of Carts, Waggons, and Agricultural Implements will be forwarded to any address on receipt of 1s. 6d. in postage stamps.

TO NOBLEMEN and GENTLEMEN who require a plentiful and CONSTANT SUPPLY of PURE WATER at their Country Mansions.



Messrs. EASTON and AMOS beg to offer their improved PATENT HYDRAULIC RAM, which is perfectly self-acting, and without manual labour is capable of lifting water to 30 times the height of the waterfall by which it is worked.

THIS MACHINE CAN BE APPLIED WHEREVER A FALL OF WATER OF A FEW FEET CAN BE OBTAINED, and its cheapness and durability, with the fact that upwards of 500 of them erected in England and other countries by Messrs. EASTON and AMOS have now been at work many years, afford ample proof of its great value and efficiency.

Estimates of the expense of the Machine, Pipes for the conveyance of Water, Tanks, and Reservoirs, may be had on application to Messrs. EASTON and AMOS, CONSULTING ENGINEERS to the ROYAL AGRICULTURAL SOCIETY, at their office in Orange-street, Trafalgar-square, or at the Works in the Grove, Southwark, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

BOILERS OF ALL SIZES TO BE SEEN IN OPERATION, WARRANTED THE BEST.

J. WEEKS AND Co., King's-road, Chelsea, HORTICULTURAL ARCHITECTS, HOTHOUSE BUILDERS, and HOT-WATER APPARATUS MANUFACTURERS, solicit an inspection of their various Works completed and in progress. Horticultural Buildings of every variety. BOILERS of all sizes to be seen in operation, and which they warrant to be the most effective and economical of any in use. The largest size Boiler is now effectually heating three extensive ranges of Forcing-houses, 230 feet by 22 feet, all Span Roofs and lofty, containing upwards of 50,000 cubical feet of air. Also various small and intermediate size Boilers, some of all sizes in operation. The consumption of fuel is very moderate, and the fires will continue from 10 to 15 hours without attendance. The extensive arrangements now in full operation on their premises, enables them to build to any extent, and at very moderate prices. Hothouses, Greenhouses, Conservatories, Forcing-pits, Frames, Glass Lights, &c. A very extensive collection of Stove and Greenhouse Plants, which are sold at very low prices. Plans, Estimates, and Catalogues forwarded on application.

J. WEEKS and Co., King's-road, Chelsea.

STALLIONS FOR SALE.—Two five-year-old Suffolk Stallions, the property of T. BEALE BROWNE, Esq., Hampen, Andoversford, Gloucestershire. One is 17 hands high, the other over 16. They are sure foal getters, and were much admired and highly commended by the Judges at the Royal Agricultural Society's Show at York.

Also two very fine five-year-old Suffolk Geldings.

ALLSOPP'S BURTON AND EAST INDIA PALE ALES.—Messrs. S. ALLSOPP and SONS beg to call the attention of the public to their East India, Pale, and other Burton Ales, which may be obtained in casks of 18 gallons and upwards, either singly or in any quantity, by application to the Brewery, Burton-on-Trent, or on the same terms at their respective Stores, as follows:—61, King William-street, London; Cook-street, Liverpool; under the Exchange, Ducie-place, Manchester; and at the Market-place, High-street, Birmingham.

Sales by Auction.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Auction Mart, Bartholomew-lane, on FRIDAY, March 22d, at 12 o'clock, about 150 Double Camellias of various sizes, well set with bloom buds; 200 Standard and Dwarf Roses, selected varieties; choice American Plants, Dahlias, Verbenas, Fuchsias, &c.—May be viewed the morning of Sale; Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

BRENTFORD.—TO NOBLEMEN, GENTLEMEN, NURSERYMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed to submit to public competition by Auction, on the premises, Brentford Nursery, Brentford, Middlesex, on MONDAY, March 18th, and two following days, at 11 o'clock precisely, by order of the Executors of the late Mr. J. Ronalds, the first portion of the valuable NURSERY STOCK, consisting of Evergreens and Fruit Trees; also the choice Greenhouse Plants, together with two Greenhouses, several two and three-light Boxes, Hand-lights, Hot-water Pipes, Boilers, Seed-shop Fixtures, Horses and Carts, a capital Chaise, a quantity of Bricks, Garden-pots, &c.; also the Stock of Seeds.—May be viewed prior to the sale; Catalogues may be had, 1s. each (returnable to purchasers), of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

CHOICE CAMELLIAS FOR SALE BY AUCTION, AT MESSRS. LODDIGES' NURSERY, HACKNEY.

MR. J. C. STEVENS is directed by Messrs. Loddiges to sell by Auction, on their Premises at Hackney, on TUESDAY, the 19th, and WEDNESDAY, the 20th of March, at 12 for 1 o'clock, a selection of about 1000 CAMELLIAS, from 3 to 12 feet high, beautifully formed plants, well furnished with bloom-buds, and comprising many Double White, Candidissima, Donckelarii, Aulica, and other choice sorts; also a few fine specimens of Araucaria excelsa, 4 to 5 feet, Rhododendrons robustum and campanulatum, 3 to 5 feet. Handsome Plants of Andromeda floribunda in flower, and some Limes in fruit.—May be viewed the day before the Sale, and Catalogues had on the Premises, and of Mr. J. C. STEVENS, 38, King-street, Covent-garden, London.

HARDY CONIFERS, WELL DESERVING THE ATTENTION OF THE GROWERS OF THIS INTERESTING TRIBE.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King-street, Covent-garden, on FRIDAY, 22d March, at 12 for 1 o'clock, the following HARDY CONIFERÆ, &c.: 2000 Cedrus Deodara, from 6 inches to 2 feet; 200 Araucaria imbricata, from 12 to 18 inches; 50 Abies Khutrow, 1 foot to 1½ foot; 200 Pinus Gerardiana, 4 years old; 100 Pinus excelsa, 12 to 18 inches; 40 Cupressus torulosa, 12 to 18 inches; 12 Picea cephalonica, 1 foot; 25 Picea Webbiana, 3 years old; 6 of the rare Araucaria Bidwellii, 8 inches; 25 Quercus Fordii, 1½ to 2 feet; and 100 Corræa speciosa major, 1 to 2 feet, well set with bloom.—May be viewed the day prior and morning of sale, and Catalogues had.

CAMELLIAS, STANDARD ROSES, AND CRYPTOMERIA JAPONICA.

MR. J. C. STEVENS is directed to sell by Auction, at his Great Room, 38, King-street, Covent Garden, on WEDNESDAY, March 27, at 12 for 1 o'clock, a collection of 250 Camellias, from 1 to 6 feet, 300 Standard Roses of the finest sorts of Hybrid Perpetual and Bourbon, and 200 fine seedling Cryptomeria Japonica from 1 to 3 feet.—May be viewed on the morning of Sale, and Catalogues had of Mr. J. C. STEVENS, 38, King-street, Covent Garden, London.

TO THE NOBILITY, GENTRY, WIRE-WORKERS, &c.
KING'S ROAD, CHELSEA.—ORNAMENTAL, DOMES, PHEASANTRIES, ARCADES, &c.

MR. KIRKE has been favoured with instructions from Mr. Butler (who is retiring from business), to sell by Auction, on the premises, 1 and 2, Beaufort-terrace, King's-road, Chelsea, on THURSDAY, March 21, at 11 for 12 o'clock, all the STOCK, comprising Ornamental Domes, Pheasantries, Arcades, Columns, and Arches, wrought-iron Greenhouse, Stages, Stands (circular, oval, and elliptic, to divide), Standard Rose Trainers, large Umbrella ditto, large and small Coops, large and choice Collection of Flower Stands, Tree Guards, Iron Garden Chairs, Rustic Seats and Chairs, Wire Fence, a great variety of Bird-cages, &c.—May be viewed the day prior and morning of Sale. Catalogues had on the premises, and at the Office of the Auctioneer, 19, Brompton-row, Brompton.

TO GENTLEMEN'S GARDENERS, FLORISTS, AND OTHERS.

TO BE DISPOSED OF, a Small NURSERY, in a capital Situation, near London, well adapted for a Gentleman's Gardener about commencing business.—For terms, &c., apply to Messrs. PROTHEROE and MORRIS, Leytonstone, or to ROBERT J. GREEN, 28, Cannon-street, City, London.

TO MARKET GARDENERS, &c.

TO BE DISPOSED OF, the Materials of an Old VINERY, 60 feet long and 20 feet wide.—Apply to ASHBY and HORNER, Builders, No. 7, Aldgate, London.

TO GARDENERS, SEEDSMEN, AND FLORISTS.

TO BE LET, with immediate Possession, an old established Concern in the principal and most fashionable thoroughfare in Brighton, the Western Road; comprising the Seed, Fruit, and Florist Business, with excellent Vinery, Show-house, and Stove. In-coming moderate.—Apply to Messrs. ROGERS and AYLING, Nurserymen, Withdean, near Brighton.

TO NURSERYMEN AND OTHERS.—LOUTH.

TO BE LET, from year to year, or for a Term of Years, from Old Lady-day next, all that old-established and well-accustomed NURSERY situate near the River Head in Louth, Lincolnshire, containing about six acres, together with a comfortable Dwelling-house standing thereon, and also a Garden House and various Brick and Glass Frames, now or late in the the occupation of Mr. Thomas Cocking. The land is in a good state of cultivation, has various fine Beech and Privet hedges thereon, and is well adapted for the raising of Plants, Shrubs, and Trees, and presents a rare opportunity for persons in the above Business taking an advantageous situation, there being no other Nursery of any magnitude within many miles of the town of Louth. The incoming tenant would most probably have the option of purchasing at a low valuation a quantity of Seedling and other plants and Trees, which may be on the premises undisposed of on the 6th of April next.—For further particulars apply to GOE and WILSON, Solicitors, Louth.

TO MANUFACTURERS OF MANURES AND PURVEYORS OF AGRICULTURAL STUFFS.

TO BE SOLD OR LET, SOME SPACIOUS MILLS, with Water and Steam Power, formerly occupied for the manufacture of cloth, with good Dwelling Houses, situate at Chalford, in the centre of the important and improving hill and vale agricultural district of Gloucestershire. This property is close to the Thames and Severn Canal, and to a station on the Great Western Railway; and this extensive field for such operations is unoccupied.—Apply to Messrs. LAWRENCE, Cirencester.

ST. IVE'S, CORNWALL.

TO BE LET, from Lady-day next, for such term of years, and on such conditions, as may be mutually agreed upon, all that excellent Messuage, Tenement, and Farm, called BICTON and REDLANDS, situate in the Parish of St. Ive, in the county of Cornwall, containing about 421 acres of Arable and Pasture Land. This Farm is well situated for markets, being only 5 miles from Liskeard and Callington, and within easy distance of several navigable ports.—For further particulars, apply to Messrs. H. T. and A. SMITH, Solicitors, Devonport.

GLASS FOR CONSERVATORIES, &c.

HETLEY AND CO. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2d. to 3d. per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded, on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.
See the *Gardeners' Chronicle* first Saturday in each month.

CROSSKILL'S PATENT ROLLER.—For Rolling Spring Wheat, Growing Crops, Grass Lands, Compressing Soft Soil, and Crushing Clods. Prize Patent Wheels, Carts, and Waggons—awarded 30 sovs. prizes at Norwich. Prize Portable Farm Railway, will pay its cost the first year. &c. &c. Agricultural Museum, Stirling, N. B.

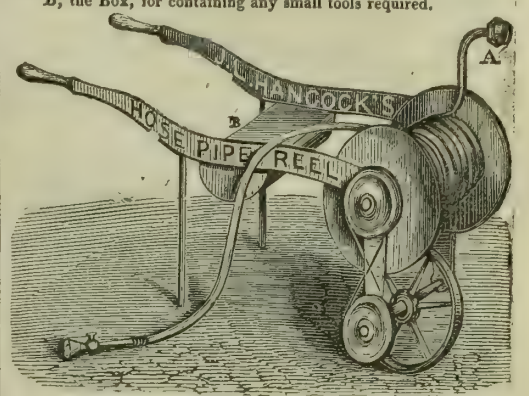
BEE HIVES.

GEORGE NEIGHBOUR AND SON respectfully announce that they have prepared for this season an extensive supply of their various IMPROVED BEE HIVES, which are offered to all who are desirous of cultivating that pleasing and profitable branch of rural economy—the Honey Bee. The collection consists of "Nutt's Collateral Hives," "The Single Box Hive," "The Amateur Bar Hive," "The Improved Cottage Hive," &c., from either of which the honey may be taken at any time without injury to the Bees, and may be worked with safety, humanity, and profit, by the most timid and unaccustomed to Bee manipulation. A descriptive paper, with drawings and prices, will be forwarded on the receipt of two postage stamps.—GEORGE NEIGHBOUR and SON, 127, High Holborn, London..
"Nutt on Bees" (6th edition), now published.

JOHN BAILY, PURVEYOR TO HER MAJESTY AND H.R.H. PRINCE ALBERT, 113, Mount-street, Grosvenor-square, London, Dealer in every description of Useful and Ornamental POULTRY and WATER-FOWL. Dorking, Hambro', Spanish, Polish, and Cochin China Fowls. Gold and Silver Spangled Bantams. All sorts of Pea Fowls. Gold, Silver, Pied, and Ring-necked Pheasants. Tame-bred Pheasants in any numbers. Live Partridges for turning out.—Priced Lists and Estimates forwarded by post, on application.



PATENT SPADES, DAISY RAKES, SCYTHES, Draining, and other Garden Tools. Mole Traps, 6s. per dozen. Carpenters' and Smiths' Tools, &c. Ladies' Garden Tools, 7s. 9d. a set. Sword-scrapers for Gardens, 1s. 2d. each. Dr. Arnott's Ventilating Chimney-valves, plain 5s; Ornamental ditto for Drawing-rooms: at J. H. BOOBBYER and Co's (late STURCH and BOOBBYER), Ironmongery, Brass-foundry, Nail and Tool Warehouse, 14, Stanhope-street, Clare-market, London. Established nearly 200 years for the sale of goods from the best Manufactories at the lowest prices. Goods forwarded to any part on the receipt of remittance.

MR. EDWARD RYDE, SURVEYOR, LAND AGENT, &c., will send free, on receipt of 14 postage stamps, "A READY RECKONER, with Plain Instructions for Measuring and Valuing Hay Ricks." A Registry of Farms to Let, and Estates for Sale, is preparing. Particulars for insertion are respectfully invited. Land Surveying, Mapping, and Levelling, accurately executed. Land Agencies conducted by yearly contract; 14, Upper Belgrave-place, Eaton-square, London.

FLEXIBLE INDIA-RUBBER HOSE PIPES.

JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING. These Pipes are well adapted for watering Gardens, conveying Liquid Manure, for Breweries, Gas Fittings, Chemical and all purposes where a perfectly sound WATERPROOF and FLEXIBLE PIPE is required. Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently flexible in all temperatures, and are therefore particularly suitable for Fire-Engines; and from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes. Being extremely portable, stowing closely without danger of injury, resisting the influence of climate, insects, and vermin, frequently so injurious to such articles on board ship, and retaining their virtues though long out of use, render them particularly adapted for exportation.
N.B.—VULCANISED INDIA-RUBBER GARDEN HOSE, fitted with Roses, Jets, and Branches, complete, with Union Joints, ready to attach to Water Cisterns.

A, represents the Union-joint, for effecting the communication between the Hose-reel and the Tank, or Reservoir.
B, the Box, for containing any small tools required.

J. L. HANCOCK invites attention of parties using long lengths of the Flexible Garden Hose, to his SELF-ACTING HOSE PIPE REEL, which is found a most convenient machine for winding up and conveying away the Hose when out of use.
All letters or Orders addressed to J. L. H. at the Manufactory and Warehouse, Goswell-mews, Goswell-road, London, will meet with immediate attention.

FRUIT TREES, FLOWER-BEDS, &c.—Garden Netting, of superior quality, for preserving Fruit trees from frost, blight, and birds, or as a fence for rabbits, fowls, pigeons, Tulip and Seed beds, can be had in any length or quantity at 3d. per yard 2 yards wide, or 6d. per yard 4 yards wide, from JOHN KING FARLOWS, Fishing Rod and Net Manufactory, 5, Crooked-lane, London-bridge. The netting being tanned will stand exposure to the weather for many years. Forwarded to any part of the kingdom on receipt of post-office order, or reference in town. An allowance to gardeners and large consumers.—Copy the Address, 5, Crooked-lane, London-bridge.

CUCUMBER AND MELON BOXES AND LIGHTS.

One hundred 1, 2, and 3-light Boxes and Lights of all sizes ready for immediate use. Warranted best materials. packed and sent to all parts of the kingdom; 2-light Boxes and Lights from 1*l.* 4*s.* Garden Lights of every description, Conservatories, Green and Hot-houses, made and fixed in all parts of the kingdom. References given to the Nobility, Gentry, and the Trade, in most of the counties of England. JAS. WATTS, Hothouse Builder, Claremont-place, Old Kent-road, London.

THE IMPERIAL COVERLETS, now so universally admired and appreciated, as a Cheap, Durable, LIGHT, Warm, and Elegant COVERING for the BED, can be had, Wholesale and Retail, of W. H. BATSON and Co., 1, Princess-street, Manchester; and 499, Oxford-street, London.
"I disapprove exceedingly of thick heavy Quilts and Counterpanes; they should always be avoided, especially by invalids, as they irritate delicate frames and prevent sleep."—*Dr. Graham's "Domestic Medicine,"* pages 192, 729.

GREY GOOSE FEATHERS, 1s. per lb.—HEAL AND SONS' present prices for Bed Feathers are:—

Poultry	0s. 8d.	Best Grey Goose	1s. 10d.
Grey Goose	1 0	White ditto	2 2
Foreign ditto	1 6	Best Dantzic ditto	3 0

Purified by steam, and warranted sweet and free from dust.—HEAL and SONS' List of Bedding, containing full particulars of weights, sizes, and prices, sent free by post, on application to their Factory, 196, Tottenham-court-road, London.

"Where cruder juices swell the leafy vein,
Stint the young germ, the tender blossom stain."

DR. SCOTT'S Aperient Tablets (of a delicious flavour) will be found a prompt, efficacious, and invigorating alterative aperient Medicine, correcting those crudities of the vital fluids which constitute the primary cause of every disease, and, by assisting Nature in all her requirements, speedily restores the patient to health. They are also the safest and best medicine for children. "A new Medicine, called Dr. Scott's Aperient Tablets, has, by its extraordinary virtues, taken the public by surprise. It is a mild, aromatic, tonic aperient, of a pleasant flavour; and to such as suffer from indigestion, impaired appetite, bilious or liver complaints, inactive bowels, nervous affections, impurities of the blood and secretions, gout, dropsy, worms, &c., we strongly recommend it. It is also a safe, pleasant, and efficacious medicine for children."—*Morning Chronicle*, Jan. 25. Sold in boxes, at 1s. 1½d. and 2s. 9d. Agents: RUDD and Co., 151, Strand (of whom they may be had for 15 postage stamps); and sold by all Dealers in Patent Medicines throughout the Kingdom.

EMIGRATION to the AUSTRALIAN COLONIES.—For ADELAIDE, PORT PHILLIP, and SYDNEY, the fine, 1st-class, teak-built ship ORIENTAL, Capt. J. P. TAYLOR, 1000 tons, coppered and copper-fastened; will sail from the St. Katharine's Docks on the 23rd inst., calling at Plymouth. This very superior ship is fitted up expressly for the comfort of passengers, and from her great height 'tween decks, which are admirably lighted and ventilated, offers accommodation rarely to be met with. All the cabins are enclosed and of an extra size, for families and married couples. The passage money, 20 guineas each adult, including bedding, mess utensils, and provisions, which will be ample in quantity (see dietary scale), and excellent in quality, for which a guarantee will be given, and in addition, passengers are invited to be present at their inspection. There will be a library on board. There is a most magnificent poop and saloon of very large size, with elegant accommodation for cabin passengers. A skilful surgeon will proceed in the ship. For freight, passage, and all particulars, apply to JOHN WHITTAKERS, 78, Mark-lane; or to W. R. BRUFTON, 89, Great Tower-street, London.

NEW PHLOXES.

ROBERT M. STARK, Edgehill Nursery, Edinburgh, begs to intimate that he is now prepared to send out the under-mentioned Seedling PHLOXES, raised by R. Girdwood, Esq., F.C.H.S. They where exhibited, and awards made to several, at various shows last summer. Among other encomiums, Mr. G. was congratulated on his "unexampled success in raising such a batch of seedlings," by the Floricultural Editor of the Gardeners' Journal. The descriptions below are in part extracted from that Paper of August 4th. In form the pips are all finely circular; limbs flat, smooth, and of proper thickness.

CLEOPATRA.—"An exquisite bloom, form perfect, colour pearl white, eye distinct." *3s. 6d.*

DIANA.—"Form excellent, colour lilac blush, eye circular." *3s. 6d.*

EDGEHILL BEAUTY.—"Nice white flower, petals not very large, but a noble trusser, and very attractive flower." *2s. 6d.*

GIRDWOODII.—"Very pretty thing, ground colour lilac shaded to white, eye distinct, size large." *3s. 6d.*

JOAN.—"Form good, colour bright lilac, inclining to purple at the centre, large." *3s. 6d.*

MIRABILIS.—"Form desirable," colour pale lavender, eye circular. *2s. 6d.*

RADIANCE.—"Colour lilac blush, a fine trusser." *2s. 6d.*

SNOW FLAKE.—Pure white, form good, also producing noble trusses. *2s. 6d.*

The set of Eight for *20s.*

For other varieties, R. S. begs to refer to his Catalogue of Florists' Flowers, which is now ready, and may be had on application.—Hope-street, Edinburgh, March 16.

THOMAS CRIPPS respectfully announces to his Friends that he has now ready for sending out strong healthy plants of those unique and matchless half-shrubby CALCEOLARIAS raised by Mr. Cole, gardener to the Right Hon. Lady Maria Meade.

To enter into details of the respective merits of these floral beauties will, I trust, be deemed unnecessary, further than to state that, amongst hundreds of eminent judges who visited the collection during the two past seasons, may be enumerated the following nurserymen, gentlemen's gardeners, &c., from some of whom letters have been received expressive of their desire to arrange for the purchase of the whole stock of plants, viz., Messrs. Henderson, Nurserymen, Pine-apple-place; Mr. Ayres, Blackheath; Mr. Gibbs, late foreman to Mr. Epps, Maidstone; and Mr. Ogle, gardener, Eridge Castle. Mr. Woodhouse, of York, in reply to specimens of cut flowers submitted, says, "I have visited most of the Calceolaria growers' collections during the past season, but have seen nothing equal to the specimens received from you." Editor of the Gardeners and Farmers' Journal, June 16th last: "We congratulate you on your good fortune in raising such a batch of flowers. If they are seedlings of your own sowing, and of one sowing, we can only say you are very lucky, and it must be your own fault if you do not avail yourself of such unexampled success."

The above in sets of six plants, *1l. 10s.*, with the usual discount on three sets.—Tunbridge Wells Nursery, Kent.

FLOWER SEEDS, POST FREE.

G. BAKER begs to recommend to the Nobility, Gentry, and his friends in general, the following very choice and superior assortment of FLOWER SEEDS, which are now ready to be sent out in sealed packages, at the prices affixed, post free.

8 Ditto	ditto	Zinnias	...	2	0
20 Ditto	ditto	Perennials, including splendid mixed varieties of Verbena, Petunia, Hertsease, Pentstemon, Calceolaria, &c.		5	0

Remittances expected from unknown correspondents (either by post-office order or postage stamps).

GEORGE BAKER, Seedsman, Wells, Somerset.

NEW CATALOGUE OF CHOICE GERANIUMS, FUCHSIAS, VERBENAS, PANSIES, PETUNIAS, CHRYSANTHEMUMS, PHLOXES, &c.

HENRY WALTON begs to inform the Public that his Priced and Descriptive CATALOGUE, containing the very best selections of the above, is now ready, and can be had for one stamp.

Twelve of the best Fuchsias sent out last season *12s.*, or Six for *7s. 6d.*, can be sent by post, free. All the fine older varieties at *5s.* per dozen. 12 of the best Show Pansies, *6s.* to *9s.* 12 of the best Show Pinks, *6s.* post free. Also fine plants of Mitraria coccinea, first week in April, at *5s. 6d.*, can be sent by post.

H. W. has been favoured with the stock of two beautiful CALCEOLARIAS, raised by Mr. Gordon, of Foxhill-bank, near Accrington, Lancashire, viz., "Fairy Queen," creamy ground, with large purple spots in the centre, small pink spots round the margin; form excellent. A very distinct variety, *3s. 6d.* "Beauty," a very pretty flower, of fine form; ground colour creamy, with pink spots, *3s. 6d.*

The above have been seen by competent judges in different parts of the country, who have pronounced them first-rate, and decided acquisitions to any collection. As numerous orders have been received from parties who have seen them, and the stock is small, early orders will have the best plants. Now ready and sending out.

All orders must be prepaid, and made payable at Burnley.

Edgend Marsden, near Burnley, Lancashire.

ROBERT THOM, MARKET GARDENER, Cornhill, Aberdeen, is now sending out plants of his Strawberry, "THOM'S SEEDLING," which is one of the finest under cultivation, at *1l. 1s.* per 100; 25 plants sent post free, *7s. 6d.*

Agents: Messrs. Hurst and M'Mullen, Seedsmen, Leadenhall-street, London; Mr. John Scott, Landscape Gardener, Chester-road, Manchester; Mr. John M'Lane, Gardener and Florist, Camera-square, Chelsea.

Orders addressed to R. THOM, Cornhill, will be punctually attended to.—Cornhill Gardens, Aberdeen, March 16.

"SUNSET" VERBENA.

MESSRS. JEYES AND CO. have much pleasure in offering for Sale the above Verbena. The two eminent growers named below have described its character.

"Your Verbena 'Sunset' is quite distinct from any other scarlet. Its habit for bedding is the best we know of. The name is well applied, for a mass of its flowers has all the appearance of a declining sun.—DANIEL JUDD, Gardener to the Right Honourable Earl Spencer, K.G.; WALTER GREY, Gardener to the Right Honourable Sir James Parke."

Plants *5s.* each; if two are ordered three will be sent.

P.S.—The Prices of the Rare Flower Seeds advertised and described in this Paper of March 9 are—Hibiscus speciosa, *2s. 6d.*; Æthionema membranaceum, *6d.*; Myosotis azoricus, *2s. 6d.*; Pentstemon Murrayanum, *2s. 6d.*; Calandrinia umbellata, *2s. 6d.* per paper.—Northampton, March 16.

Now Reprinting, the Second Edition, with Additions, price *5s. 6d.* cloth,

ORNAMENTAL AND DOMESTIC POULTRY;

ROYAL BOTANIC SOCIETY, Regent's Park.—GENERAL EXHIBITIONS, WEDNESDAYS, MAY 8th, JUNE 12th, and JULY 3d.

AMERICAN PLANTS.—SATURDAYS, May 25 and June 1. Tickets to be obtained at the Gardens, by orders from Fellows of the Society, price, on or before Saturday, April 27, 4*s.* each; after that day, 5*s.*; or on the days of Exhibition, 7*s.* 6*d.* each; and such Tickets will admit to the Collection of American Plants, from the 3d of June to the 8th, both included.

N. B. Fruit will be exhibited on June 12 and July 3.

RAY SOCIETY (ESTABLISHED 1844) for the publication of Works on Natural History.

Subscribers are informed that a volume of Papers on Botany, edited by A. HENFREY, Esq., and a History of the British Entomostraca, with 36 plates, by D. BAIRD, for the year 1849, are now ready, and will be forwarded to members who have paid their subscriptions.

The Society, since its establishment in 1844, has published 17 volumes, 15 of which are illustrated mostly by coloured plates, on various branches of natural history. A list of these works may be obtained by application to the London Secretary. A very few complete sets of the works may be still had, or for any particular year. Subscription for one year, 1*l.* 1*s.*

By order of the Council, EDWIN LANKESTER, M. D., Secretary.
22, Old Burlington-street, London.

JOHN CATTELL begs to offer the following superb CALCEOLARIAS, at 2*s.* 6*d.* each, viz, Madame Merric, Superb, Emperor, Sir Harry Smith, Beauty Supreme, Standishii, Supreme, Exemplar, Masterpiece, and Lydia.

Also the following fine bedding varieties:

KENTISH HERO, 9*s.* per dozen.

INTERMEDIA, rich yellow, 9*s.* per dozen.

CATTELL'S HERO, rich velvety crimson, of the same size and form as the Kentish Hero, of which it is a seedling; in habit it is not quite so shrubby as Kentish Hero, consequently there is little else but flowers to be seen. It was greatly admired by all who saw it in bloom last summer, and continued in flower from June till October. 7*s.* 6*d.* each, no discount to the trade, excepting when three are ordered four will be sent.

The above are all young healthy plants, in good condition for travelling.

TIGRIDIA CONCHIFLORA, 2*s.* 6*d.* per dozen.
" PAVONIA, 1*s.* 6*d.* per dozen.

J. C. has a large stock of strong plants of Delphinium Barlowii and grandiflorum maximum, worth the attention of the trade. A remittance or reference is expected from unknown correspondents.—Westerham, Kent.

SUPERB NEW VERBENA, ADAMS'S "MISS PAYNE."

The above beautiful variety was raised by Mr. W. Adams, Gardener to W. Hogg, Esq., Bigglesw ade, and will be found the best White Verbena of the season. To flowers of an extraordinary size it unites a delicious fragrance, which adds much to its attractions.

Extract from the *Gardeners' Chronicle*, Oct. 13, 1849. "W. A. A. Colour pale blush, fading to white; flowers very large, but narrow in the lobes; a good variety, on account of the size of its flowers, both individually and collectively."

Extract from a letter from Mr. J. Bundy, Gardener to — Trevor, Esq., Bromham Hall, Beds. "I beg to say I saw your seedling Verbena, and must say it was remarkably fine, much more so than any I had ever seen before, therefore you are at liberty to make what use of my name you may think proper."

Opinions, equally favourable, have also been expressed by Mr. Pullen, Gardener to the Hon. and Rev. H. C. Cust, Cockayne, Hatley, near Potton, Beds.; Mr. Pope, Gardener to Mrs. Harvey, Ickwell Green, Beds.; and many other gardeners, to whom reference is kindly permitted. Good Plants, post free, 5*s.* each; when two are ordered three will be sent.

London Agents: Messrs. HURST and M'MULLEN, 6, Leadenhall-street.

Address, SUSAN WOOD, Nurseries, Huntingdon.

P.S. Postage stamps received as payment.

"SUNSET" VERBENA.

MESSRS. JEYES AND CO. have much pleasure in offering for Sale the above Verbena. The two eminent growers named below have described its character.

"Your Verbena 'Sunset' is quite distinct from any other scarlet. Its habit for bedding is the best we know of. The name is well applied, for a mass of its flowers has all the appearance of a declining sun.—DANIEL JUDD, Gardener to the Right Honourable Earl Spencer, K.G.; WALTER GREY, Gardener to the Right Honourable Sir James Parke."

Plants 5*s.* each; if two are ordered three will be sent.

P.S.—The Prices of the Rare Flower Seeds advertised and described in this Paper of March 9 are—Hibiscus speciosa, 2*s.* 6*d.*; Æthionema membranaceum, 6*d.*; Myosotis azoricus, 2*s.* 6*d.*; Pentstemon Murrayanum, 2*s.* 6*d.*; Calandrinia umbellata, 2*s.* 6*d.* per paper.—Northampton, March 23.

FLOWER SEEDS.

RENDLE'S DESCRIPTIVE CATALOGUE can still be had for two postage stamps (to pay the postage).

"The Flower Seed List is peculiarly comprehensive, and gives to each variety its scientific name, hardihood, time of duration, colour, height, and time of flowering. Our readers will thus see that from its universal utility, we can scarcely say too much in its recommendation, and we are sure that the name of the eminent firm will be a sufficient guarantee that every article they send out will not only be true to name, but also of the best possible quality."—MIDLAND FLORIST for January, 1850.

FLOWER SEEDS.

We have a superior stock of all the newest kinds, and as some of the choicest varieties are grown under own inspection, we can warrant them to be quite new and correct to name.

SCALE OF PRICES SENT POSTAGE FREE.

No. 1.—100 Packets choice sorts, including all the best Hardy, Half-hardy, and Greenhouse Annuals, Biennials, and Perennials, ... 18*s.*; larger packets, 25*s.*
No. 2.—50 Ditto ditto ditto 10*s.*; ditto 15*s.*
No. 3.—25 Ditto ditto ditto 6*s.*; ditto 8*s.*

Complete lists of the sorts included in each collection will be found in the Book Catalogue; or, if preferred, a selection may be made from it, at the purchaser's option.

IMPORTED GERMAN SEEDS,

In the original Sealed Packets.

We have concluded an arrangement with one of the largest growers of Flower Seeds on the Continent for a large supply of imported German Seeds, and we have much pleasure in stating that we can with confidence recommend them as being of very superior quality, and such as we are sure will give the most complete satisfaction.

WILLIAM E. RENDLE AND Co., Union-road, Plymouth.
ESTABLISHED 1786.

NEW AND STRIKING VERBENA.

ARTHUR MACKIE begs to offer the undermentioned to the attention of Florists, with the fullest conviction that it will give entire satisfaction.

WOODSTOCK'S MAGNIFICENT.—A. M. having purchased the entire Stock of this unrivalled Verbena, offers it to the Public with the utmost confidence, being fully persuaded that it will surpass everything yet out in its class. The individual flowers cover a sixpence, and sometimes a shilling. It is of a very free habit and growth, and well suited for grouping. See *Gardeners' Chronicle*, Sept. 15, 1849.—"*W. K. B.* Colour bright rose, fading to pink; a remarkably fine variety, with much the largest flowers we have yet seen."

Fine strong plants the 1st of April, at 5*s.* each, free by post. Where three are ordered four will be sent.

MACKIE'S Descriptive Catalogue of Flower and Vegetable Seeds is now ready, and will be forwarded on receipt of two stamps for postage.—Norwich Nursery, Norwich, March 23.

NEW AND RARE SEEDS.—DAHLIA, saved from the best and newest varieties, including the fancy sorts.

FUCHSIA, from named show flowers.

GERANIUM, from all the best and choicest varieties.

PANSY, saved by the best growers from the choicest varieties.

PICOTEE AND CARNATION, from the best show flowers.

PINK, saved by a celebrated florist from choice named show flowers. The above Six varieties, including postage, for 5*s.*, or 1*s.* each packet.

Calandrinia umbellata, Centranthus macrosyphon, Gramanthes gentianoides, Heliaphila trifida, Ipomœa formosa, a new dark variety; Nemophila maculata, Phlox Drummondii Leopoldii, Tropæolum speciosum.

The last named Eight sorts, including postage, for 7*s.*, or 1*s.* each paper.

To be had of WILLIAM DENYER, Seedsman and Florist, 82, Gracechurch-street, London.

N.B.—A Descriptive and Priced Catalogue may be had on application.

NEW CATALOGUE OF CHOICE GERANIUMS, FUCHSIAS, VERBENAS, PANSIES, PETUNIAS, CHRYSANTHEMUMS, PHLOXES, &c.

HENRY WALTON begs to inform the Public that his Priced and Descriptive CATALOGUE, containing the very best selections of the above, is now ready, and can be had for one stamp.

Twelve of the best Fuchsias sent out last season 12*s.*, or Six for 7*s.* 6*d.*, can be sent by post, free. All the fine older varieties at 5*s.* per dozen. 12 of the best Show Pansies, 6*s.* to 9*s.* 12 of the best Show Pinks, 6*s.* post free. Also fine plants of Mitraria coccinea, first week in April, at 5*s.* 6*d.*, can be sent by post.

H. W. has been favoured with the stock of two beautiful CALCEOLARIAS, raised by Mr. Gordon, of Foxhill-bank, near Accrington, Lancashire, viz., "Fairy Queen," creamy ground, with large purple spots in the centre, small pink spots round the margin; form excellent. A very distinct variety, 3*s.* 6*d.* "Beauty," a very pretty flower, of fine form; ground colour creamy, with pink spots, 3*s.* 6*d.*

The above have been seen by competent judges in different parts of the country, who have pronounced them first-rate, and decided acquisitions to any collection. As numerous orders have been received from parties who have seen them, and the stock is small, early orders will have the best plants. Now ready and sending out.

All orders must be prepaid, and made payable at Burnley.
Edgend Marsden, near Burnley, Lancashire.

SEEDS IN COLLECTIONS.
OF THE BEST WHICH CAN BE PROCURED.

BASS AND BROWN beg to offer the following CHOICE VEGETABLE SEEDS.

Remittances with orders are requested from unknown correspondents. Goods carriage free to London, and with all orders of 2*l.* and upwards, articles presented extra. Post-office orders payable to BASS and BROWN or to STEPHEN BROWN.

Our Descriptive Priced Seed and Plant List will be forwarded, prepaid, on application, by forwarding four postage stamps, as copies having the Newspaper stamp are now all distributed.

SEED AND HORTICULTURAL ESTABLISHMENT, SUDBURY, SUFFOLK.

NEW GLOBE FUCHSIA, "KIMBERLEY'S INACCESSIBLE."—This splendid variety was raised from Williamsii, and is far superior, the blooms being twice the size of that variety; sepals very broad; tube rather short, of a bright glossy crimson; corolla rich deep velvety purple; habit very fine, and a free bloomer; foliage rich glossy green; will prove one of the greatest ornaments ever offered. Strong plants 10*s.* 6*d.* each, the 15th of April, may be obtained of C. KIMBERLEY, Florist, &c., Pinley, near Coventry, and of the following gentlemen, who have kindly ordered it: Messrs. WOOD and SON, Maresfield, Sussex; Mr. IVERY, Peckham, near London; Mr. GAINES, Surrey-lane, Battersea; and Messrs. WIDNALL and DAVIS, Grantchester, Cambridge.

RICHARD SMITH begs to call attention to the following New and desirable Plants, which will be sent out by him early in April.

PETUNIA ECLIPSE.—This is a very beautiful variety, which will give general satisfaction. The flower is large and of good texture; ground colour pale rosy flesh, very fully marked with rich crimson maroon veins, forming in their density and peculiar shape a perfect star in the centre of the flower; it is a free bloomer, of good habit, and unquestionably the most beautiful light variety hitherto sent out.

CACTUS (EPIPHYLLUM) MAXIMUS.—This is a hybrid, of enormous size, between Speciosissimus and Ackermanni major, of a bright deep red colour, slightly tinged with purple in the centre; it is very showy, an opinion of which may be formed when it is mentioned that the flower when expanded measures 10 inches across. See Notice to Correspondent "S.," *Gardeners' Chronicle* of July 5th, page 460.

Price of Petunia and Cactus, 5*s.* each. Where three or more are ordered of either or both they will be charged 3*s.* 6*d.* each.

Nurseries, Worcester, March 23.

BEAUTIFUL FLOWERS.—A few Packets of superior DOUBLE BALSAMS at 1s. per packet; also some fine DOUBLE SWEET WILLIAMS at 6d., post-free. 100 packets of Flower Seeds, for 5s.; 70 for 4s.; 32 for 2s. 6d.; or 12 for 14 postage stamps, post free, warranted. A List, with directions for sowing, may be had, inclosing a sample packet for 2 stamps.
Address, JOSEPH GOLDING, Seed Merchant, Hastings.

TURNIP SEEDS.—The Subscribers have for Sale 200 Bushels of fine large GREEN-TOP BULLOCK YELLOW TURNIP SEEDS of crop 1849, and warranted genuine.—J. MORRISON and SON, Seedsmen, Banff, March 23.

THOMAS CRIPPS respectfully announces to his Friends that he has now ready for sending out strong healthy plants of those unique and matchless half-shrubby CALCEOLARIAS raised by Mr. Cole, gardener to the Right Hon. Lady Maria Meade.

To enter into details of the respective merits of these floral beauties will, I trust, be deemed unnecessary, further than to state that, amongst hundreds of eminent judges who visited the collection during the two past seasons, may be enumerated the following nurserymen, gentlemen's gardeners, &c., from some of whom letters have been received expressive of their desire to arrange for the purchase of the whole stock of plants, viz., Messrs. Henderson, Nurserymen, Pine-apple-place; Mr. Ayres, Blackheath; Mr. Gibbs, late foreman to Mr. Epps, Maidstone; and Mr. Ogle, gardener, Eridge Castle. Mr. Woodhouse, of Whitby, in reply to specimens of cut flowers submitted, says, "I have visited most of the Calceolaria growers' collections during the past season, but have seen nothing equal to the specimens received from you." Editor of the Gardeners and Farmers' Journal, June 16th last: "We congratulate you on your good fortune in raising such a batch of flowers. If they are seedlings of your own sowing, and of one sowing, we can only say you are very lucky, and it must be your own fault if you do not avail yourself of such unexampled success."

The above in sets of six plants, 1l. 10s. From unknown correspondents a remittance is requested.
Tunbridge Wells Nursery, Kent.

GIANT SAINFOIN.—The Advertiser having grown the above valuable Plant for some years, begs to offer it to his agricultural friends. It has proved invaluable to farmers, as it can be grown on either light or heavy soils, if well drained, producing a crop of Hay, Seed, and Sheep-feed in the same year. The advertiser gave 3l. per bushel to the original grower, and now offers it at the reduced price of 10s., at which price any quantity above 3 bushels may be obtained on application, with a post-office order for the amount of the seed and sacks, to Mr. W. DOGGETT, Newnham, near Baldock, Herts. If any information is required, W. D. will be happy to give it.

BROMHAM-HALL GREEN-FLESH MELON IS THE FINEST FLAVOURED IN THE WORLD.

EDWARD TILEY having become possessed of the whole stock of Seed of that very superior MELON called "BROMHAM-HALL GREEN-FLESH MELON," he is now sending out good sound Seeds at 2s. 6d. per packet of 6 seeds; larger do. of 15 seeds, 5s. per packet. For further particulars of the above, see Advertisement in this Paper, February 9th. Also the following fine varieties can be highly recommended:

	s.	d.	
Queen Melon	1	6	per packet.
Bowood Green-flesh	1	0	"
Beechwood do.	1	0	"
Windsor Prize do.	1	0	"
Emperor	1	0	"
Fleming's Trentham Hybrid	1	0	"
Duncan's Green-flesh do. improved	1	0	"
Hampton-court Green-flesh	1	0	"
Egyptian do. do. improved	1	0	"
FIRST PRIZE CUCUMBERS.			
Victory of Bath	2	0	"
Gordon's White Spine	1	6	"
Lord Kenyon's Favourite	2	6	"

A packet of each of the three varieties, 5s.; if preferred, also a packet of Bromham-hall Melon will be included with the three Cucumbers for 7s.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 16, Pulteney-bridge, Bath. A remittance must accompany the order, either in cash or penny postage stamps.

EDWARD BECK, SLATE WORKS, ISLEWORTH. SLATE CISTERNS, &c.; COLE'S PATENT.

E. BECK informs Horticulturists and the Public generally that Mr. COLE has granted him the use of his Patent for the unexpired term, and he is now able to supply SLATE CISTERNS fastened without iron bolts or the usual oil cement, thereby doing away with the difficulty which has hitherto existed of forwarding such articles by rail or waggon, fixed and ready for use instead of in pieces, as heretofore.

E. B. will be happy to answer any inquiries as to the price of Cisterns, or any other Slate articles manufactured by him, such as Orange Tubs, Plant Boxes, Tanks, Shelves, Garden-path Edging, Hot-water Tank Covers, Flower Boxes for Balconies, Shelves fitted to hold water for Orchidaceous Houses, &c., all of which may be seen in use at Worton Cottage, Isleworth, on application to the Gardener, Sundays excepted.

Estimates given for Work as shown upon Drawings, and in specifications. A large stock of Slate Slabs of all sizes and thicknesses, kept on sale.

DEANE'S WARRANTED GARDEN TOOLS.—Horticulturists, and all interested in Gardening pursuits, are invited to examine G. and J. DEANE'S extensive Stock of GARDENING AND PRUNING IMPLEMENTS, best London made Garden Engines and Syringes, Coalbrookdale Garden Seats and Chairs.

COCHIN CHINA FOWLS.—New laid EGGS for setting, may be had, by applying by letter post paid, to "W. O.," at Mr. M'LACHLAN'S, 6, Birchin-lane, Lombard-street, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

BOILERS OF ALL SIZES TO BE SEEN IN OPERATION, WARRANTED THE BEST.

J. WEEKS AND Co., King's-road, Chelsea, HORTICULTURAL ARCHITECTS, HOTHOUSE BUILDERS, and HOT-WATER APPARATUS MANUFACTURERS, solicit an inspection of their various Works completed and in progress. Horticultural Buildings of every variety. BOILERS of all sizes to be seen in operation, and which they warrant to be the most effective and economical of any in use. The largest size Boiler is now effectually heating three extensive ranges of Forcing-houses, 230 feet by 22 feet, all Span Roofs and lofty, containing upwards of 50,000 cubical feet of air. Also various small and intermediate size Boilers, some of all sizes in operation. The consumption of fuel is very moderate, and the fires will continue from 10 to 15 hours without attendance. The extensive arrangements now in full operation on their premises, enables them to build to any extent, and at very moderate prices. Hothouses, Greenhouses, Conservatories, Forcing-pits, Frames, Glass Lights, &c. A very extensive collection of Stove and Greenhouse Plants, which are sold at very low prices. Plans, Estimates, and Catalogues forwarded on application.
J. WEEKS and Co., King's-road, Chelsea.

STATUES, VASES, FOUNTAINS, GARDEN ORNAMENTS, COATS OF ARMS, &c., and ARCHITECTURAL EMBELLISHMENTS in Imperishable Stone, by VAUGHAN and Co., 60, Stones End, Borough, London. T. J. CROGGON, late of Coade's, Superintendent. A Pamphlet, containing Drawings of a portion of the Stock, forwarded on application.

BY HER MAJESTY'S ROYAL LETTERS PATENT.
CROGGON'S PATENT ASPHALTE ROOFING FELT has been extensively used and pronounced efficient, and particularly applicable for warm climates.
1st. It is a non-conductor.
2d. It is portable, being packed in rolls, and not liable to damage in carriage.
3d. It effects a saving of half the timber usually required.
4th. It can be easily applied by any unpractised person.
5th. From its lightness, weighing only about 42 lbs. to the square of 100 feet, the cost of carriage is small.
Price One Penny per Square Foot.
CROGGON and Co.'s. PATENT FELTED SHEATHING for COVERING SHIPS' BOTTOMS, &c., and NON-CONDUCTING FELT for STEAM BOILERS, PIPES, &c., preventing the radiation of Heat, and saving 25 per cent. of Fuel.
Samples, testimonials, and full instructions, on application to CROGGON and Co., 2, Dowgate-hill, London.

HOTHOUSES AND CONSERVATORIES made and fixed complete in all parts of the Kingdom, at a considerable reduction. One, two, and three-light Cucumber and Melon Boxes and Lights of all sizes, kept ready for use, packed, and sent to all parts of the Kingdom; warranted best material. Garden-lights of every description, at JAMES WATTS', Hothouse Builder, Claremont-place, Old Kent-road. Reference may be had to the Nobility, Gentry, and the Trade, in most of the counties in England.

MARQUEES, SUN-BLINDS, RICK-CLOTHS, &c.—Manufactory, Old Kent-road (facing the Bricklayers' Arms Railway Terminus), and 17, Smithfield-bars, London.

The guests are arriving; my villa has got
Quite a park-like appearance—a beautiful spot;
The band on the lawn, in the spacious marquee;
This tent for our dinner and that for our tea.

Marquees and temporary rooms superbly fitted up for Fêtes, &c., on most moderate terms, by THOMAS EDGINGTON and Co., Tents of every description, Rick Cloths with Poles, &c. Tanned Netting, for the protection of fruit trees from frost, blight, and birds, and for the security of fresh sown seed, either in gardens or fields, at unprecedented low prices, viz., 1d. per square yard, or 200 yards for 14s., or 500 yards for 30s., or 1000 yards for 50s. Gardeners and shopkeepers supplied by the cwt. New Archangel Mats and Scrim Canvas for wall fruit. Tarpaulings for houses under repair or hire. Orders and inquiries per post immediately attended to.

FLEXIBLE INDIA-RUBBER HOSE PIPES.
JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING. These Pipes are well adapted for watering Gardens, conveying Liquid Manure, for Breweries, Gas Fittings, Chemical and all purposes where a perfectly sound WATERPROOF and FLEXIBLE PIPE is required. Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently flexible in all temperatures, and are therefore particularly suitable for Fire-Engines; and from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes. Being extremely portable, stowing closely without danger of injury, resisting the influence of climate, insects, and vermin, frequently so injurious to such articles on board ship, and retaining their virtues though long out of use, render them particularly adapted for exportation.
N.B.—VULCANISED INDIA-RUBBER GARDEN HOSE, fitted with Roses, Jets, and Branches, complete, with Union Joints, ready to attach to Water Cisterns.
All letters or Orders addressed to J. L. H. at the Manufactory and Warehouse, Goswell-mews, Goswell-road, London, will meet with immediate attention.

EMIGRATION to the AUSTRALIAN COLONIES.—For ADELAIDE, PORT PHILLIP, and SYDNEY, the fine, 1st-class, teak-built ship ORIENTAL, Capt. J. P. TAYLOR, 1000 tons, coppered and copper-fastened; will sail from the St. Katharine's Docks on the 23rd inst., calling at Plymouth. This very superior ship is fitted up expressly for the comfort of passengers, and from her great height 'tween decks, which are admirably lighted and ventilated, offers accommodation rarely to be met with. All the cabins are enclosed and of an extra size, for families and married couples. The passage money, 20 guineas each adult, including bedding, mess utensils, and provisions, which will be ample in quantity (see dietary scale), and excellent in quality, for which a guarantee will be given, and in addition, passengers are invited to be present at their inspection. There will be a library on board. There is a most magnificent poop and saloon of very large size, with elegant accommodation for cabin passengers. A skilful surgeon will proceed in the ship. For freight, passage, and all particulars, apply to JOHN WHITTAKERS, 78, Mark-lane; or to W. R. BRUFTON, 89, Great Tower-street, London.

CHOICE GERANIUMS AND FANCY GERANIUMS.

HOLDER AND CARROD, NURSERY and SEEDSMEN, Bedford Road, Clapham Rise, beg to offer 12 of the following varieties (strong plants), for 21*s.*, cash. 12 do.	do.	do.		3*s.*

With a large assortment of German Stocks, Asters, &c., imported direct in sealed packets.

Gateshead Nursery, Newcastle-upon-Tyne.

KITLEY'S GOLIAH STRAWBERRY.

JAMES KITLEY, in again bringing his SEEDLING STRAWBERRY before the notice of the Public, takes this opportunity of thanking those Friends who so liberally purchased in the autumn, and it being now the best time for planting, begs to inform them that he has a fine stock of healthy plants, which have been transplanted. See extracts from the *Gardeners' Chronicle.*

From the *Gardeners' Chronicle.*—"STRAWBERRIES: *J. K.* Your Seedling Strawberry, 'Goliah,' judging from its size and appearance, is worthy of cultivation."

From the Gardeners and Farmers' Journal.—"STRAWBERRIES: *J. K., Lyncombe Vale.* We have great pleasure in bearing testimony to the exquisite flavour of your Seedling Strawberry, 'Goliah.' In our opinion it combines the piquant flavour of the Strawberry with the richness of the Pine, the delicious aroma of which it partakes in equal proportion with the taste. Apart from the queen of fruits, we certainly do not remember anything in this way that conveyed to our senses so delicious a treat as the noble fruit to be known to the world as 'Kitley's Goliah Strawberry.'"

Plants, 12*s.* per doz., or 4*l.* per 100. A liberal allowance to the Trade in plants, when 100 are taken.

Cash orders expected from unknown correspondents.

Lyncombe Vale Nursery, Bath, March 23.

HOME GROWN SEEDS, CARRIAGE FREE,

By the Great Western, South Western, and South Eastern Railways.

JOHN SUTTON AND SONS being daily in the receipt of numerous orders from various parts of the kingdom, beg respectfully to intimate that they execute all orders in strict rotation, and with as little delay as possible. J. S. and SONS having a large stock of all the articles named in their Advertisements which have appeared in previous Numbers of the *Gardeners' Chronicle*, can still supply any of those articles.—Reading Seed Warehouse, Reading, Berks.

MEETINGS AT WORTON COTTAGE, ISLEWORTH, for the Display and Examination of SEEDLING FLORISTS' FLOWERS, and other objects of Horticultural Interest.

The Editor of the FLORIST AND GARDEN MISCELLANY particularly requests that all Seedlings for the opinions of the Censors of that work may be posted, as far as practicable, so as to reach Mr. BECK, Isleworth, Middlesex, on the Wednesday morning of each week. Parties desirous of attending personally with their productions, by taking the 4 o'clock train for Isleworth from the Waterloo Station, will be put down within a few minutes' walk of Worton Cottage.

The Meetings will be held on Wednesday, April 3d, and each succeeding Wednesday, at 5 o'clock, P.M.

An Artist will attend these Meetings, to take coloured memoranda of anything particularly striking.

The Gardeners' Chronicle.

SATURDAY, MARCH 23, 1850.

"PRAY, Mr. EDITOR, what is MACHE?" "*Mache,* Madam, is Corn-salad." "I mean that beautiful Lettuce-like plant that one sees everywhere in Paris in the winter." "That, Madam, is Mache or Corn-salad" "Well, but what is Corn-salad?" "It is a very old vegetable, a sort of Valerian, which once was cultivated by everybody, and now is seldom seen." "And why not seen? I am sure we have nothing half so good in England." "Pardon me, Madam, we have *it* in England; you may buy its seed in every shop, and the salad itself in Covent Garden." "How very strange! our gardener knows nothing about it, nor how to manage it; and it is most provoking, for we are all lovers of salad, and in winter we have nothing but Celery and bitter Endive, with Mustard and Cress. If we see a Lettuce, it is a poor wretched thing, too tough to eat, and too ugly to admire." "Then, Madam, I would order the gardener to grow Corn-salad, as his grandfather did, if his grandfather was a gardener. It is as well however that he should have what is called *Mache d'Italie,* which is much better than our own Corn-salad, and is what has attracted your attention in Paris." "But where can I buy the *Mache d' Italie*? I dare say our seedsman never heard of it." "Perhaps not, but he may procure it from Paris in these railway days, without difficulty, or from his London correspondent, who will obtain it for him."

"Another thing, Mr. Editor. Pray tell me why we never have Lettuces in winter, like those we have in summer." "The reason, Madam, is that gardeners don't grow them." "And why not?" "Because they don't generally know how. The Dutch have them in great excellence; we seldom have. Perhaps if you insisted you might succeed."

"One word more, Mr. Editor—I really am very troublesome—and I have done. As I have said, we are all such great lovers of salad, and that must be my excuse. I wish to ask you what is meant by *Scarolle,* another winter vegetable one sees in Paris?" "Scarolle, Madam, is Batavian Endive." "But it is not much like Endive; it is not so curled, and not so bitter, and much larger, and more tender." "All very true, Madam, still it is a kind of Endive; well known in England, but little cultivated. It is more hardy as well as more delicate." "Then, why do not our gardeners produce it?" "Some do; but we suppose it is not the fashion in the kitchen; and if we might hazard a supposition on the subject, it would be that it is not thought to look so well." "But I want a salad that is good to eat, as well as to look at." "You will find it difficult, Madam, to overcome the prejudices of your servants. They will not permit you to have green Asparagus; and they will not permit you to have Scarolle." "I shall, however, insist upon it." "Then, Madam, we have the honour to assure you, that if you will *really* insist, your gardener may produce you as good salad here as in France."

THE facts connected with GROUND TEMPERATURE are so seldom studied, and so little appreciated, that we are induced, in consequence of the remarkable depression of the thermometer since the beginning of the present month, to draw attention to the facts which a comparison of the evidence before us elicits.

The temperature of the air, and of thermometers sunk 1 and 2 feet respectively in thoroughly-drained land, since the beginning of the present year, is as follows:

1850.	Temperature of the Air. Max.	Min.	Mean.	Ground Temperature, at the depth of 1 foot.	2 feet.
Jan..	38.58	27.64	33.11	36.35	37.98
Feb.....	50.21	35.29	42.60	41.98	41.71
March 1	53	38	45.5	43	43
— 2	53	43	48.0	44	43½
— 3	54	33	43.5	45	44
— 4	44	20	32.0	44	44
— 5	48	26	37.0	42½	44
— 6	56	27	41.5	42	43
— 7	56	31	43.5	42	43
— 8	47	38	42 5	43	43
— 9	50	27	38.5	43½	43½
— 10	54	28	41.0	42½	43½
— 11	48	20	34.0	43	44
— 12	51	21	36 0	42	43½
— 13	57	30	43.5	41½	43
— 14	47	34	40.5	42	43
— 15	47	18	32.5	43	43
— 16	48	23	35.5	41	43
— 17	48	17	32.5	39⅓	42
— 18	44	24	34.0	38¼	41⅓
Average	50.27	27.66	38.96	42.33	43.18

The next Table gives a Comparison of the average Ground Temperature, at 1 foot and 2 feet of depth, in March, 1850, and previous years.

	1 foot deep.	2 feet deep.
Mean of March, 1838.....	41°.48	41°.46
" " 1839.....	41 .46	41 .93
" " 1840.....	39 .24	41 .71
" " 1844.....	41 .55	42 .14
" " 1845.....	37 .79	38 .37
" " 1846.....	44 .47	45 .55
" " 1847.....	40 .22	41 .03
Mean of the preceding years ...	41 .16	41 .74
Mean of the first 18 days in March, 1850	42 .33	43 .18

From this we learn the very unexpected fact, that, notwithstanding the low range of the thermometer in the present month, the mercury having sunk below 26° on seven nights out of 18, and on one occasion as low as 17°, yet the average ground temperature for the *first* 18 *days in March* is actually higher than for the *whole of March*, in any recent year except 1846, and that it is more than 5° above the average of the whole of March, 1845.

Hence we arrive at the unexpected information that, notwithstanding occasional severe frosts, probably of very short duration, and towards morning, an unusual amount of warmth is accumulating in the soil, ready to force vegetation into great activity as soon as any permanent advance takes place in heat and light. It is evident that if Almonds are not in flower, and Apricots are scarcely opening their bloom on the 18th of March, it is not because of any unusual deficiency in the temperature of the soil, but because the nights are so cold as to act as a diurnal check upon the progress of vegetation, while the days are not warm enough or bright enough to cause any diurnal counteraction. In fact the tem-

perature of the air by day has in no one instance during March exceeded 57°.

The inference that we venture to draw from this is, that we have now before us unusually cheering prospects of a fine, vigorous, and rapid growth whenever vegetation shall begin, and that crops of all kinds will be abundant, unless some disaster, not to be foreseen or arrested, should blight them. With such an accumulation of heat as nearly 43¼° in the ground by the 18th of March, it is improbable that the free action of roots, upon which the prosperity of cultivators so essentially depends, should be impeded by any ordinary event.

These tables moreover show that the mean temperature of the air in January was 33.11°, or about 3½° below the mean of the month for 23 years. The temperature of the earth at one foot below the surface was about 3½° above that of the air; and at two feet it was nearly 5° warmer than the air.

In February the air was 3° above the average for the month. The earth, although several degrees warmer than in the preceding month, averaged somewhat lower than the air. From the 1st to the 18th of March, inclusive, the temperature of the air, 3½° below the average of the period, was upwards of 3° colder than the earth at one foot below the surface; and more than 4° colder than the earth at two feet deep.

Taking the whole period since the commencement of the year, the temperature of the air has averaged 38.22°; that of the earth, at one foot deep, exactly 2° warmer than the air; and about 2¾° warmer at two feet deep. Usually, as the spring advances the mean temperature of the air and earth comes to an equality; in summer the air is warmer than the earth; but in autumn, when the sun-heat has begun to decline, an equality may be again remarked; and in winter the earth is somewhat warmer than the air.

According to tables published in the Journal of the Horticultural Society, vol. iii. pp. 99–109, the earth at the above depths averages on the whole year from 1 to 1½° higher than the mean of the air; and, generally, in other parts of the globe, the earth, if accessible to air, preserves a temperature differing little from that of the mean temperature of the air of the locality.

Therefore we must infer that plants have, generally, their roots in a medium between those extremes of heat and cold to which their tops are exposed. Roots are not naturally subjected to a temperature equal to the extreme heat of the day; nor to a cold corresponding with that of the night; their natural temperature is doubtless that to which they are most generally exposed; and this, it appears, lies about midway between the two extremes. This, then, is the mean which should be sought for the roots of plants under artificial treatment; and yet how differently are they often situated! Many unfortunate Vines have doubtless their roots at the present moment in an outside border far below the lowest night temperature kept up in the house; under such circumstances, the roots act very imperfectly: and the colder the border the more nearly is the Vine reduced to the state of a cutting, which may be made to grow without roots till it exhausts itself; and it is well known that if precautions are not taken to keep Vine borders warm whilst hard and early forcing is carried on, Vines do become much exhausted. Roots cannot be well formed in soil exceedingly cold compared with the temperature in which the top is vegetating. When the latter is early forced its vegetation is almost ready to cease before midsummer, when the border would naturally be sufficiently warmed to encourage the growth of roots; and such roots as are then made cannot be so fully matured as not to be liable to perish in winter. When that happens we hear loud complaints of the composition of the borders; whereas, in nine cases out of ten, their coldness in the early part of the season, compared with the heat inside the house, is their only fault.

ROSES.

General Remarks.

The generality of Rose-growers, as we have already shown, have spoiled their gardens by the introduction of many worthless varieties, by the choice of sorts which do not uniformly bloom at the same time, and attempting to have some of these varieties in bloom all the summer and autumn. With regard to the worthless varieties, all we need say is, that by such name we denounce those Roses which have no one claim that give them a place by the side of others of the same colour, and in all respects better. For instance, if a Rose with a thick petal, abundant bloom, double flowers, and always blooming, is in a garden, every Rose of the same colour that has none of these points become worthless in the same establishment. All Roses that are fairly beaten by others in all respects are worthless, and there is scarcely one garden among the hundreds we have seen, where an attempt is made to grow Roses, but what we have observed many so flimsy that an hour's sun spoils them; others, so far from double, that they look poor and miserable; others, again, so excessively rambling, that they cannot be kept commonly tidy for a week together in the growing time; others of the most awkward and eccentric growth and habit, that they defy all the skill of the most practised gardener to form a handsome head, or to make them look well as a bush or shrub; some which yield but few flowers, and they soon over, yet in a Rosery of any pretension as to number of specimens, we are sure to find all these, and many more, very remarkable for their bad qualities and the absence of any redeeming points. These ought to be removed at once, and be for ever discarded.

The Rose catalogues require weeding, for they make young beginners anxious to grow many more varieties than are good or even tolerable, and have already led to the evils which we have stated to exist. The second evil, the want of uniformity in the time of blooming, may exist with a collection of good Roses, and nothing more completely mars the general effect. Above all considerations the Rose cultivator should be careful that all the Roses that form a particular feature should bloom at once; can there be anything so ludicrous as a row of pillars and festoons of Roses with some in flower and others not? The whole design is marred by such an oversight, because it is not right at any time; when the late ones are come into flower the early ones have gone out, so that the effect is still spoiled, see them when you will. Again, see, as we have seen, a covered archway with the majority of Roses in flower and here and there large blanks occasioned by Roses not yet in bloom or gone by altogether. Nothing goes further towards spoiling everything.

The third evil is universal, and runs through every establishment we have seen—an attempt to prolong the blooming season of Roses by having spring, summer, and autumn varieties, so that two kinds are always out of flower. It is undoubtedly very pretty to come across a stray perpetual or other Rose in flower amidst a host that have passed their bloom, but it would be infinitely better to come to a walk where all were in perfection. If it be determined to have all these classes of Roses, let them be placed in departments, that they shall at least form something like a feature. It may be tolerated in a nursery to plant the whole collection in a continuous row, and show off such as happen to be in bloom, but even in a nursery it would be far better to have the collections separate. It is true persons order from those they see in flower, and perhaps the contrast between those which have lost all their beauty and the few that are in perfection may show off the latter to advantage; but a gentleman's garden ought never to look desolate. There is no excuse but the want of means for having a garden untidy for any length of time; but to have it always faulty, because of an injudicious selection of plants, is too bad. We would willingly persuade every Rose cultivator to look to his garden, and if he have the Roses all about the place among other flowers, to gather them altogether as soon as the season arrives, and form such as are good for anything into a Rosery of some kind, even if it be of the most simple description; and if he value as we do the continuous blooming, to make such changes in his stock as may enable him to compass that object, but at all events to so classify what he has, that whatever portion of them are seen, they may be all in one condition, and not some in flower and some out. Above all things we would recommend those who wish to begin growing Roses, to plant them together, to let no other flower divide the attention, to appropriate some portion of the garden to those Roses which, like the common China, is never out of bloom while it is growing. If, in addition to those which should form the great feature, he likes to appropriate other departments to the mere volatile varieties that are here to-day and gone to morrow, to let them be grown where they will not interfere with the brighter and more constant tenants of the Rosery. If any one who grows many varieties would pay attention to those which are always blooming, and observe how they continue to grow and flower from month to month, he would not be long in deciding the fate of the more fickle sorts. Much might be done towards improving a Rosery if the old and worthless kinds were budded with better ones, but it is preferable to bud on new Briars, which should be procured in the autumn, at the nurseries, or of the hawkers who carry them about, and be planted in rows for the convenience of working, in the same way that standard Roses are planted, except that the application of dung is unnecessary, and the Briars may be planted as near as 18 inches; or in case room were a great object, even 1 foot apart in the rows, and the rows 3 feet from each other. In the season we propose to give a descriptive list of a few of the most unexceptionable Roses of the description we have mentioned, that is, Roses which bloom as soon as they begin to grow well, and continue growing and flowering more or less until the frost cuts them off, and noticing some few of the most remarkable in each of the distinguished sections or classes. The former will be useful to those who can grow but few, and want flowers all the summer; the latter will be a guide to those who grow more extensively, and can give up a department for the best of other families. *Crito.*

DISEASES OF PLANTS.

(*Continued from p.* 165.)

Genus I. Knotted Roots. — It frequently occurs that the roots of plants, instead of extending freely, form into knots or tufts at their extremities, which end by being a certain cause of death to the individual. This happens when they are confined in too small a space, which prevents their development. The most frequent examples are those of plants left in pots by gardeners, which, especially those endowed with great vigour of vegetation, readily become thus pot-bound, as it is termed. It also happens sometimes to trees, when their roots meet in the ground with obstacles to their due extension. The evil may be prevented by proportioning the pots to the plants. For its cure, it suffices to prune off the knotted tufts and remove the plant to a proper recipient. I have often restored diseased plants by this operation, and, on the other hand, have lost many a one from neglecting it.

Genus II. Flatness of Form.—Academical Transactions, especially German ones, memoirs of literary societies, and scientific journals, are full of instances of what are usually called whims or monsters of the vegetable race; but which are no other than stems, branches, petioles, or peduncles, which, instead of retaining their natural cylindrical form, become flattened and more or less cracked. Sometimes they exhibit the most singular forms, as where the dilatation is extreme, the edges very thin and curved inwards, like the volutes in architecture. We observe it especially in the Elm, in its lowest branches near the ground, or in the hedges, particularly when grown in rocky ground. Herbaceous plants also afford frequent instances. I know that the general opinion attributes this phenomenon to a defect in the germ. But having impartially studied what has been written on the subject, and examined numerous instances myself, I believe that it is due for the most part to causes purely external. Mœrhingius asserts that he never saw more flattened stems than in gardens, and on succulent delicate herbaceous plants endowed with a vigorous vegetative force, which in issuing from the ground, and in their first development, had encountered stones or bits of wood *quæ tenello surculo illerum interstitia perforanti hanae figuram conciliabant.* Asparagus and other plants of a similar mode of growth are liable to these flattened stalks. When two stems growing close together meet with some obstacle, they will combine into a number of singular forms without any predisposition in the germ. So roots of trees, growing against walls or other obstacles, will become flattened or combined into a variety of forms, and roots which have penetrated into pipes afford another example. But as these deformities are of little interest to the cultivator, it is needless to dwell further upon them.

Genus III. Strangulation. — I here enumerate a genus of disease, of which one species has been classed by other authors among infirmities derived from weakness, and the other under Necrosis. I call strangulation the disease under which a plant is impeded in its free growth by some external purely mechanical cause, whether it be by some other plant attacking its roots underground, and causing it to perish, or twining round and enveloping it above ground, or other analogous modes.

First species. Strangulation of Roots.—There are many plants that are thus injurious to others; some which are called parasitical, by feeding on the sap itself of other plants; others attack the roots so as to prevent their growing. Thus the *Lycoperdon* and the *Orobanche*, growing about the roots of other plants, strangle them till they die, as was the case in the year 1806 with a large number of Hemp fields of the province of Bologna. We know also that Saffron is liable to a disease called *Fausset*, in which a tumour, like a little Radish, grows upon the bulb of the Crocus, sucks up its sap, and causes it to perish. Sometimes the destruction of these bulbs is accompanied by a change in colour, the greater part of their bulb being converted into a black earthy substance. But often also they are merely dried up and reduced in bulk. The same thing may be said of the roots of Beans and Hemp infested with the Orobanche. Duhamel's observations show that the Lycoperdon which attacks the Crocus kills other bulbs also, such as Lilies and Tulips. I have shown the extreme difficulty of obviating this evil in a memoir on the parasites which injure Hemp. I am of opinion that the only remedy is the burning the soil, which will destroy the germinating power of the seeds, and thus effectually clear the field of them.

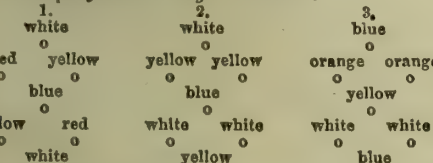
The roots of corn are often prevented from growing by being too closely pressed by the earth, especially in clayey soils whose molecules adhere so closely. When the heavy rains of spring are followed by long droughts or parching winds, the soil in drying strangles the roots. Hence the excellent rules for treating such stiff soils with admixtures which shall prevent the too close adherence of their particles.

Second species. Strangulation of the Stem.—The Cuscuta or Dodder, germinating in the ground, extends over the stems of plants in a sort of network, which impedes their growth. Flax, Clover, and Lucerne are three plants upon which it commits great havoc with us. Fields not well levelled and rather moist appear to be most subject to it. If it appears in one corner only the surface soil of the affected part of the field must be immediately dug up and burned, as the only means of arresting the rapid progress of the evil. If it shows itself at once in many parts of the field there is no remedy but destroying the whole crop and cultivating something else for a few years; otherwise there is great danger that the seeds will not be entirely extirpated. Sometimes spiders and insects will injure leaves and delicate parts of plants by spreading their webs over them. The injury done to trees by Misletoe, Ivy, &c., which either attach themselves or cling round them, is

well known, and proves the necessity of cutting off these parasites in the early stage of their growth.

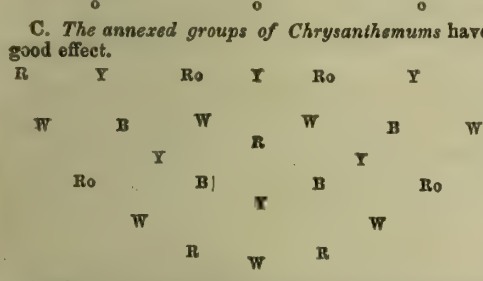
In fields some plants will, if not quite, choke each other, at any rate impede much each other's growth, if genera or species that do not suit each other are planted together. Thus plants of vigorous and rapid growth, if intermingled with others of slow development, will more and more injure the latter as their roots extend, rob all nutriment from them, and finally choke them. This shows how important it is for those who delight in uniting a great variety of crops in one field to attend to this mutual interference of the different plants, and also how essential it is to keep all crops free from weeds.

M. CHEVREUL'S SCHEMES OF FLOWERS FOR OCTOBER.



In the month of October Chrysanthemums are in perfection, and beautiful arrangements can be made with the white, red, rose, orange, and yellow varieties, with which too can be associated with considerable advantage the great blue-flowered Aster; these arrangements are the more easy to realise, as Chrysanthemums can be fully developed in pots.

The following arrangements will be found to be of considerable beauty; the colours to which the name of no flower is attached, refer to Chrysanthemums.



A. *Chrysanthemums in lines.*—1. White, red, white, rose, yellow, large blue-flowered Aster, orange or mahogany coloured Chrysanthemum; then repeat in the same order. 2. White, red, yellow, large blue-flowered Aster, orange Chrysanthemum; then repeat.

For linear arrangements, with a symmetrical centre, the following are recommended. 1. Red, yellow, white, orange, large blue-flowered Aster, orange, white, yellow, orange. The same arrangement may also begin and end with a white Chrysanthemum. 2. White, orange, large blue-flowered Aster, yellow, white, yellow, large blue-flowered Aster, orange, white. And Chrysanthemums may be added to the beginning and end of the last arrangement, if there is room.

B. *Groups of seven Chrysanthemums.*

C. *The annexed groups of Chrysanthemums* have a good effect.

In the above diagram the colours are marked by their respective initial letters, R standing for red and Ro for rose.

Concluding Remarks.—The plants composing each assortment above described, observed for several years in the environs of Paris on an elevated spot of ground, have usually flowered at the same time; but in some years this may not always be the case, and then the advantage of the contrast of their colours is no longer obtained; this however does not in the least affect the principles on which the arrangements are made; and, indeed, even if the plants do not all flower at the same time, the arrangements above pointed out will be preferable to the ordinary methods of planting, inasmuch as the plant which does not flower at the same time as its neighbour will present, by its symmetrical position, something more agreeable to the eye than if there were no symmetry between the plants in and those out of flower.

If, in consequence of a difference of climate or other circumstances, those plants which are above stated as being in flower at the same time, are not so as a general rule, the one offering the exception must be replaced by something else of the same colour and of the same general appearance as itself.

The arrangements of plants recommended for the early months of the year are more likely to differ in the times of their flowering than the others, in consequence of the mildness or severity of the winter; and it must not be forgotten that many plants stated to flower in one month often continue in flower in the succeeding months.

Home Correspondence.

Pear Moths.—I did not intend to trouble you again on this subject, thinking that the facts previously stated by me were sufficient to clear up any doubts which might be fairly entertained as to the habits of Tortrix angustiorana. But as certain members of the Entomological Society are reported in your last week's Paper, to have still expressed doubts as to its "ravages," perhaps you will allow me to state a few additional particulars. Notwithstanding I have three years' experience, it is still insisted upon that the larva of this moth occupies the calyx of the Pear merely by accident. Now if repeated accidents of this kind are not to be considered habits, I shall feel obliged if some member of the Society will inform me how many years' probation does constitute a habit. Mr. Doubleday also thinks the larvæ must spin a leaf to the fruit; such is not the case, although I am fully aware of the injury done to Pears and Apples during the spring and summer months under cover of the leaf. Mr. Doubleday also states that he has never observed these larvæ on the Pear tree in his garden, yet finds it abundant on Privet and Laurel trees. On the contrary, I have found hundreds of them (as near as I can judge in the larva state), on my standard and wall Pear trees; yet after carefully searching an extensive Laurel belt east, west, north, and south, I cannot find one; and only one on the Apricot, which Mr. Westwood considers their legitimate provision. It appears, therefore, that these caterpillars have different tastes in different places. I have, however, found similar larvæ on two other shrubs, and placed them upon Pears, in the crevices of which they spin, and feed on the rind. It is clear, therefore, that they are not very particular, which I never asserted they were. I am fully aware that insects will live a long time without food, but in all the trials which I have made, and they are not a few, I have not myself been able to induce a young larva to pass through his several stages, and become a perfect imago without feeding him; and I am certain that many of these larvæ feed during the winter months on the young bark of the Pear trees. Still the injury done to the full grown Pears is not to be compared with the loss sustained in the spring by the larvæ of this or some other Tortrix, which feed on the young fruit as soon as they are formed, and sometimes destroy the entire crop. I cannot say whether this is the same species or not, as I have not bred them; but it has been my practice for some years to have my trees examined, so that these destructive creatures may be destroyed. I much regret that any gentleman who professedly delights in tracing the natural history even of an insect, should boldly put forth an opinion that his own failure in observing certain phenomena is sufficient to justify him in believing that no one else can be more successful; for if every man has to go over the same ground, we shall recede instead of advancing. While I have the pen in hand, I beg to inform Mr. Doubleday that he is most decidedly in error, in stating that the titmouse does not feed on buds, as it is well known to every gardener that no bird destroys more. *F. J. Graham, Cranford.*

What kind of Piping answers best for the conveyance of Water?—I want to lead some water from a pond to a tank about 120 yards distant. There is a good fall. Have any of your readers any experience of guttapercha piping for this purpose? and can they say which is the cheapest, gutta percha or iron? and what is the smallest size which, for the distance (assuming sufficient fall), may be used? and how deep, so as to avoid frost? Is it necessary to bury the tubes? *Dodman.*

Rough Plate Glass.—In reply to your observation that "it is entirely false that there is only one substance and quality of rough plate," we beg to observe that there is but "one substance and quality of *patent* rough plate" *manufactured by Messrs. Hartley* for horticultural purposes, and that is one-eighth of an inch thick, and about 26 oz. to the foot Patent rough plate is made of various substances, from $\frac{1}{2}$, $\frac{3}{16}$, $\frac{1}{4}$, $\frac{3}{8}$, $\frac{5}{8}$, $\frac{3}{4}$, $\frac{7}{8}$, and 1 inch in thickness, but the $\frac{1}{8}$ is what is intended for conservatories. The rough plate manufactured by Messrs. Hartley and sold by us is quite a separate and distinct article in quality and in its character from rough plate made by other manufacturers. *James Phillips and Co., Bishopsgate-street.*

Spotting of the Leaves in Forced Strawberries.—Within the last week the leaves of my Strawberries have become so much marked with black spots as to resemble the foliage that has been on the plants all winter. Peradventure this may meet the eyes of some in similar circumstances, so that, by comparing notes, we may arrive at some knowledge of the cause of this evil. My own opinion is that, during the mild weather in February, and in the beginning of this month, they should have been allowed a little air, night and day, which would have given the young leaves sufficient strength to have enabled them to withstand the effects of the late very cold winds, to which they were in a great measure exposed on giving air—being placed on a shelf along the back of a late Vinery. I do not think that we have erred in keeping them too warm, as (although they have been showing bloom a fortnight) the glass has scarcely ever stood above 50° at night, averaging about 45° in the morning: I mean, that this would not have been too much with a circulating atmosphere; but experience teaches me that the temperature in which the majority of plants respectively rejoice, would, without ventilation, be positively injurious. For my own part, I feel very much inclined to attribute the rottenness of the roots complained of by a "Constant Reader," to his plunging the pots, without any means of throwing off the rain. I prefer laying the pots on their sides; but perhaps the system of keeping them in a cold frame is better than either. I find that the soil in the best drained pots is by far too wet after heavy rains. But after all there may be other causes than this. It is singular that the plants do not show symptoms of a falling off. I hope a "Constant Reader" will let your readers know how they ripen their crop. *Ventilator. March* 20.

Garden Walks.—Good drainage, imperviousness to worms, and a binding surface, are the principal requisites in a good walk. The last must depend on the quality of the gravel, the two first are secured by the use of gas tar concrete, at a nominal expense. To renew an old walk, reduce it an inch below the adjacent soil; or to make a new walk, level the earth to that height, sloping only so much as will allow water to trickle to one or both sides; then lay on 1 inch of concrete, and roll till quite hard and close; cover with a good coat of binding gravel. The concrete surface underneath the gravel serves as a drain to carry the water to the loose earth at the sides, into which it sinks; whilst no worm can pierce or will touch the gas tar. As the greater portion of the rain strains through the surface, till it meets the concrete, there is the advantage that channels are not made in the gravel. Again, the concrete presents a hard surface, between which and the roller the gravel is pressed into a round mass after frost or snow. The objection made to gravel walks over gas tar, that black patches are produced, does not apply to this plan. The mode in which the concrete is made and applied precludes the possibility of its appearing at the surface, unless, indeed, the upper coat of gravel is stinted of its due thickness. For the mode of making the gas tar concrete, see *Gardeners' Chronicle*, p. 637, 1849. *J. P. B.*

Way in which Toads shed their Skins.—I have a small house under my care for growing Cucumbers. There is a bed in the middle of it, and the soil is about 3 feet high from the ground (*i. e.*, to the top of the hills where the plants are in). A person therefore standing in the house can examine an object placed on the hill with ease. Last Saturday, about 7 o'clock A.M., I uncovered the house, and went in to see that all was right, when to my surprise I saw my pet companion, a fine toad, apparently in the agonies of death. It was seated at the end of the ridge or hill of soil; its mouth or rather under jaw opening every few seconds (the top jaw did not move), the eyes shut, and the body violently convulsed each time the jaw opened, and with each convulsion of the body the right fore foot was raised to the head. I placed myself in front of it, and perceived that it was drawing something into its mouth each time the jaw moved; at that instant the right eye opened, it then inflated the body on the left side, and drew in the right, placing at the same time the left fore foot on the head behind the eye and drawing it down to the mouth; it then appeared to hold its foot in the mouth for about a second, when it drew it out, and I distinctly saw the three points of skin that came off its toes outside its lips till the next opening of the jaw, when they were drawn into the mouth. When it drew its foot over its left eye (which before was shut), it broke out as bright as ever. Some folds of the skin adhered to the left leg, but by two or three motions of the jaw they were gone, and in about a minute the skin was drawn off the lips—the toad had eaten its own skin, and there it stood with its new covering as bright as if it had been fresh varnished. I endeavoured to touch it, to feel if it was clammy, but the creature gave a vigorous jump, and the soil adhered to its legs. I looked at it in an hour afterwards; it had then begun to resume its dingy brown colour. The time it took to get off its head dress was only a few minutes. It appeared to me that each time its jaw opened it drew the skin forward, while it distended the body on the side to be uncovered. *W. Turner.*

Hybridising the Polyanthus.—I shall be glad if the following statement has the effect of drawing attention to the further development of the capabilities of this favourite. In the autumn of 1846, I obtained a plant of "Buchanan's seedling," which at that time was the deepest yellow, and crossed it with the view of producing new colour and larger size, it being a large sized, five-petalled, pin-eyed flower and coarse in habit. It was kept by itself in a 5-inch pot, in which it flowered and seeded in the spring of 1847. I had crossed most but not all of the pips with other border (not florists') varieties, one of which was a white hose in hose. The plant bearing the seed being pin-eyed I did not attempt to cut away the anthers, as should always be done, and which I now do by splitting the tube before the flower has expanded or the pollen is scattered, and removing the stamen with a pair of fine pointed scissors. The seed obtained was sown in pots; as soon as it was ripe the young seedlings were pricked out into larger pots that autumn and transplanted, and flowered the succeeding spring (1848). Their characteristics were, that in robustness of growth and enlargement of flower, they strongly partook of the female parent; but in shape, colour, and markings, they bore the impress of the male, and this in so remarkable a degree that the fathers and their progenies (the mother-plant being the same to all) could be eas ly recognised; many were thrum-eyed, and several were even hose in hose like the fecundating flower, yet partaking of the larger size and yellow colour in different proportions of the seed-bearing plant. I fertilised one of these seedlings of a mahogany colour, yellow centre, and a little yellow on the outer edge, but not laced down the middle of each petal, with pollen from a shrivelled flower which by accident fell in the way, and it has produced a seedling flower precisely like the corolla of the male, with a broad outer yellow edge, differing only in being increased in size and deeper and brighter in the yellow. I would suggest three objects to be worked out year after year, always selecting the seedlings and even single flowers to cross or take pollen from which may evince a disposition to sport in the direction of the properties tending

towards each aim. 1st, Doubling the Polyanthus. This I feel confident may be done ; 2d, Working the perfect florist flower into the larger, although coarser, and differently coloured classes ; and 3d, Opening up a higher standard of perfection. The latter would consist in adapting the properties of the Auricula, as far as could be done, to the Polyanthus. The desiderata would be —foliage not too coarse ; footstalk strong, and well up above the leaves ; flowers to expand without overlaying each other ; the single pips to be large, faultlessly round, flat (perhaps six-petalled), or rather the edge bending down and giving the corolla a slight convexity ; outer edge smooth and well finished, with a clear distinct border, of a uniform width, of the same shade, density, and brightness as the centre, or of a pure white with a dark yellow clear centre, but not passing at all down the middle of each division, or at all towards the centre, rendering the outer edge of the pip as nearly circular as possible ; the eye to be quite round, with a well defined rim, well filled with thrums or anthers. The centre of a clean bright colour, of a uniform width round the tube, clear and sharp at its junction with the ground colour, and all free from specks or blemishes, but pure and entire. The whole to form a compact globular head, each flower of equal size, and similar in properties. *Wissingham.*

Pond Mud.—I have cleaned out a great many ponds, and applied the mud as a top dressing for land. It is of very little value. I have mixed it with lime, sawdust, &c., but I consider it does not pay the expense. I am now engaged in clearing out a large pond on the following system : the mud is wheeled out to the side of the pond, where it will lie one year. It then becomes mellow and workable, when a crop of Potatoes and Beans will be taken off it, some little dung being put in along with the crop. A field near will then be top dressed with part of it, and the rest will be planted. *W. B., Liverpool.*

Growing Pine-apples on Hamilton's Plan, and in less Bottom-heat than usual.—Some time back I expressed an opinion that the bottom-heat usually applied to this fruit was extreme, and I likewise stated that this opinion was founded upon my own practice, having cultivated the Pine successfully with a bottom-heat not exceeding the average temperature of the house they grow in. Now, after another year's experience, these views are unchanged. I will, therefore, state what I have done, and at the same time notice one or two of the arguments used against the Hamiltonian system. The variety which I most approve of is the true Black Jamaica, which swells its fruit better than any other in winter ; it likewise retains its flavour and eating properties, after being cut, longer than any common variety, and it does not send forth such a quantity of suckers as Queens do after being turned out. Next in value is the Cayenne. I have only cut one fruit of this variety, but it has proved most promising ; its weight was about 4 lbs. 2 oz., and the report of its flavour by a competent judge was that it was equal to the Jamaica. Grown in a bed of earth, its habit is low and "stocky," with a nicely proportioned crown. I have long discontinued Providences, on account of their coarseness and want of flavour. An Enville or two may be grown for exhibition, but they will not stand the test of a gentleman's table. Queens find favour with the best cultivators, but their great disposition to multiply when planted out, together with their other properties not being equal to those of the Jamaica, have militated against their usefulness with me. It is no uncommon thing to see six or more suckers spring from a single plant ; to allow these to remain would be injudicious, and to be continually wounding the stem of the plant by their removal cannot be less so. I have never found any such difficulty with the Black Jamaica ; it invariably produces a successional sucker, at the time the fruit begins to show. A strong off-set then springs from the roots of the old plant, or a good sucker from the lower part of the stem, showing clearly that this is their natural method of propagation. One plant of the Black Jamaica ripened a fruit with me in September 1847, whose weight was 4 lbs. 8 oz. ; in August 1848, another fruit 5 lbs. 10 oz. ; in July 1849, two fruit weighing respectively 4 lbs. 2 oz. and 4 lbs. 5 oz.,* and the plant still looks strong and healthy. In this point the Hamiltonian system has an advantage over the Meudon, or transplanting plan. As soon as the old plant approaches maturity, its successor makes a natural effort to supplant it, and by the time the fruit is cut, the young plant is in full vigour, but even then I do not consider it advisable to cut down the old stem too hurriedly ; in some cases I have found this proceeding bring the young plant to a stand-still. I have found the greatest advantage in tying the old leaves together, in order to let as much light and air as possible surround the sucker, when it has gained strength sufficient to support itself, and the old leaves begin to show that they will soon be of no further use, I then remove them, making as clean and close a cut as I can. The heat I employ varies from 55° to 75° in winter, and in the growing months from 75° to 95°, the extremes being 50° and 100°, with moisture in proportion. It will thus be perceived that our average bottom heat is 65° in winter, and 85° during the growing months, and I know that this heat is sufficient for the roots of the Pine-apple. I might give instances where I have seen this fruit wintered without injury, in a night temperature of 45°, but such a course of argument is unnecessary. The temperature here in summer ranges high, and in winter rather low, and this, with an abundance of moisture at all times, is a point on which success hangs. The top-dressing of the bed every spring is also an operation of the greatest importance. My manner of doing this is to tie up the leaves of each plant with broad bast, as if they were about to be removed to the potting bench, then to remove all the soil possible, taking care not to materially injure the roots, filling up again to the requisite height with fresh light rich earth, not chopped too fine ; the object being to allow the water to pass readily away, and to admit abundance of air to the roots. The application of liquid manure has a very beneficial effect during the summer months. I have no particular time or manner of applying it—say once a week if the weather is hot and drying, or once in two or three weeks if the contrary. Sometimes we use guano, or guano and soot, purified with lime, the drainings of the dunghill ; "all's fish that comes in the net," and I have found a change from one to another of advantage. I never use shading, indeed the greatest difficulty we have to contend with is a want of light and air, and every means by which these can be increased should be taken advantage of. By attention to these simple directions I have proved that the Pine-apple can be grown successfully without a bottom heat of 85° in winter or 95° in summer, and, simple though they appear, they bring the cultivation of this fruit within the profitable reach of every owner of a hothouse. All I contend for is a bottom heat equal to the average temperature of the house, and the stool system of propagation. Let there be a free circulation of air underneath the bed ; let the air be as sweet there as in any other part of the house, which is really necessary to the health of the plants : place the pipes under the bed, or along the pathway on each side of it, it matters not, and if the circulation is good the heat will equalise itself. One objection brought against this system is, that that richness of flavour so much to be desired cannot be acquired in a growing atmosphere. This is an objection worthy of every consideration, and to a person who has not proved the disposition of the Pine-apple to accommodate itself to different circumstances, it seems a most serious one. All experience is in favour of a dry season for the ripening of almost all fruits, and we well know that Grapes or other soft pulpy fruits become insipid and watery, unless ripened in an atmosphere nearly approaching dryness ; but there is a vast difference betwixt showers of water overhead, and that dew-like moisture accumulated during the night, to be again dispersed the following morning. Withdraw this moisture, and allow the Pine-apple to be ripened in a parched atmosphere, and instead of having fruit full of juicy richness, you will have a dry hard substance not fit to be compared with the other. There are cultivators who recommend showers of diluted manure-water, overhead, up to the time the fruit changes colour, arguing that by so doing they add to the weight of the fruit. I very much doubt the utility of such an operation, and I could not expect fruit of high flavour after such treatment, but I apply it to the roots and lower part of the stem and leaves up to the time the fruit is cut, and I have always found advantage from such a proceeding. So far as I am aware, there is only one good objection to Hamilton's system, and that is the ripening or retarding the fruit at pleasure ; by the planting-out method we have power only over the fruit, the plant is stationary ; and this is one reason why I prefer the Black Jamaica to any other variety. I have had it after being cut six weeks, and knew no difference in its flavour or appearance ; and should a longer period be desirable, by cutting a little green, with a good lengthy footstalk, I think it might be kept much longer. *John Richardson, Gardener to Henry Sharples, Esq., Oswald's Croft, near Liverpool.*

Monthly Summary of Rain which fell here in 1849 :

January	Inches 2.82	August	Inches 0.78
February	1.90	September	3.24
March	0.98	October	4.49
April	4.68	November	1.59
May	2.55	December	3.78
June	1.11		
July	2.47		30.39

E. Penny, gardener to Gen. Trevor, Glynde-place, Lewes, Sussex.

What is the Best Material for Indian Tents.—I received by the last mail from India a letter from a friend, asking me to make some inquiries in London respecting the best materials for tents. My correspondent, who holds a situation under the East India Company, is obliged, at certain seasons, to make journeys through his district, and live for weeks together "under canvass." The stuff of which his tents are made is the same as that used by the natives. It is called "Numbda"—a sort of woollen fabric, about half an inch thick, very heavy, cumbrous, and expensive to boot, as it is soon destroyed by insects, and of course has to be replaced by new about once a month. He wishes me to find out if there is not a "patent felt" manufactured here, "kyanized" (*i. e.* saturated in some mixture which would preserve it from the attacks of those insects.) As the thermometer, in the district my friend passes through, is often at 140°, the "patent felt" should not of course be too thin ; but if of a close texture, it might be lighter than the numbda, and yet afford quite as good protection from both the glare and heat of an Indian sun. If you can refer me to any manufacturer of this "patent felt," or give me any hints as to the best material for Indian tents which are intended for hard service, and not for show, you will much oblige your correspondent — *Guzerat.* [Perhaps some of our friends who have lived in tents in India will afford an answer to this important inquiry.]

Death of large Elms at Southampton.—"Hantoniensis" thinks it remarkable that the Southampton people should not have suspected that an exudation of gas was killing their Elm trees which constitute "the Avenue." I beg to inform him that a Southampton gentleman has laid before the corporation his ideas as to the death of those trees. His first report stated that oxide of iron was the evil, and to prove his assertion the gas-pipes were laid bare ; but, very unfortunately for him, there were too many fibrous roots emitted, where the main roots had been severed to make way for the pipes, to render that opinion tenable ; he then discovered a smell of gas, and at once settled the point at issue by giving an exudation of gas as the cause. The ground was opened in several places, but still he was wrong ; the trees had died alike where there was a smell of gas and where there was none. Had Southampton been the only place at which Elms had died these visionary causes might have been excusable, but many of your readers have witnessed the decay of a favourite Elm miles beyond the range of gas-pipes ; and therefore I trust you will throw some light upon the matter, in order that the corporation may not attribute the loss of their avenue to imaginary causes. Another person states that the Scolytus destructor really killed the trees, but he must account for the partial appetite of his guest, for the trees have died only on the south-west side. The bark becomes loose ; it has no vitality in it, and the tree eventually dies. I believe some of these fine Elms have died, and the corporation are very desirous to save the remainder. *W. T. Good, Southampton.*

Societies.

HORTICULTURAL, *March* 19.—W. W. SALMON, Esq., in the chair. C. S. P. Hunter, J. Spode, W. S. Orr, F. Crockford, J. Whatney, D. B. Chapman, S. Maw, Esqrs., the Rev. J. L. Petit, and M. Vilmorin, of Paris, were elected Fellows. Mrs. Lawrence exhibited a specimen of the long-tailed Ladies' Slipper (Cypripedium caudatum), an extraordinary looking species, which has just flowered at Ealing-park for the first time in England. As far as colour is concerned, the flowers have little to recommend them, being, as near as possible, greenish yellow ; their peculiarity consists in the petals being extended into two long brown narrow tails, which hang down from either side of each blossom, and keep on growing and growing as the flower gets older, till it is difficult at present to say what length they may eventually reach. Those in the specimen exhibited were nearly 18 inches long, and when the flowers are elevated, as they should be, some 2 or 3 feet above the foliage, these tails must give them a most remarkable appearance. Dr. Lindley stated that the existence of tails was not uncommon among Orchids, and that an unimported species of Uropedium named Lindenii inhabiting the Cordilleras, near the lake of Maracaybo, possessed these appendages even in a more remarkable degree than this Cypripedium caudatum. The latter comes from Peru, and may now be met with in one or two collections in this country. A Large Silver Medal was awarded it.—The halberd-lipped Odontoglossum (O. hastilabium), another new Orchid, or at least comparatively new, was exhibited by Mr. Ivison, gr. to the Duchess Dowager of Northumberland, at Syon. Like the Ladies' Slipper just mentioned, this is not distinguished by brilliancy of colour ; but it is, nevertheless, a pretty species. It had a fine spike of flowers on it, whose sepals and petals were pale green, transversely marked with brown dots or lines ; the lip was large, pure white, and pale red at the base. It comes from New Grenada. A Certificate of Merit was awarded it.—Messrs. Henderson, of Pine-apple-place, produced a most beautifully grown and flowered Acacia diffusa, for which a Certificate of Merit was awarded ; and along with it small plants of Boronia triphylla, Epacris hyacinthiflora candidissima, and the red variety of Eriostemon cuspidatum.—Mr. Henderson, of St. John's Wood, sent Gesnera macrantha purpurea, a brilliant scarlet variety, with a dwarf habit ; a winter blooming Heath, in the way of Linnæoides, called Burnetti ; Siphocampylus lanceolatus, and an example of Conoclinium ianthinum, a new Composite, in its present state not so handsome as the blue Ageratum (A. cælestinum).—Mr. Fry, gr. to Miss Dent, Manor House, Lee, Kent, exhibited a self-acting contrivance for fumigating glass houses. It was made of sheet iron, cylindrical, and had a grate at the bottom lifted up on feet sufficiently high to allow a current of air to pass through the fuel on which the fumigating material is placed. It was stated that its chief advantage was that it would burn readily the very cheapest and coarsest tobacco that could be obtained.— The garden of the Society furnished a beautifully bloomed specimen of the orange-flowered Epidendrum (E. aurantiacum), a species which few can flower at all ; two Dendrobes, Stanhopea grandiflora, Lycaste macrophylla, two Epacrises, three Acacias, Eriostemon scabrum, four nicely flowered Cinerarias, the Shanghae Azalea obtusa, Henfreya scandens, Forsythia viridissima, and Hovea chorozemæfolia. The latter formed a nice little greenhouse shrub, covered with brilliant purplish-blue flowers ; but like all Hoveas it is somewhat difficult to manage. Though the Forsythia is quite hardy, it was mentioned that the blossoms required some protection in early spring, otherwise the cold and stormy weather of that season renders them ineffective.

* This is not a solitary instance ; for, with the exception of the two fruit in 1849, the next plant to it has done the same thing, allowing a few ounces more or less in different years.

Linnean, *March* 19.—The President in the chair. G. R. Dodd, Esq., was elected a fellow. A list of works presented since the last meeting was read by the Secretary. The Assistant-Secretary read a paper communicated by Sir W. Jackson Hooker, consisting of notices of some plants by the gentleman sent out from the Kew Gardens as collector, in the expedition in search of Sir John Franklin, in H.M.S. Herald. These notices were few and unimportant, and not intended for publication in the Society's Transactions.

Caledonian Horticultural. *March* 7. — Sir J. Russell, Bart., in the chair. The display of Hyacinths and other spring flowers was extensive and varied, and numerous prizes were awarded. For the six best varieties of Camellia, 1st prize to Mr. M'Lean, gr. to W. F. Mackenzie, Esq., M.P., for Carswelliana, Double White, Saccoi, Fimbriata, Imbricata, and Hendersonii; 2d, to Mr. Rooney, gr. to Prof. Dunbar, for Imbricata, Jeffersonii, Double White, Prince of Wales, Monterini, and Carswelliana. For Cinerarias: 1st to Mr. Henderson, gr. to C. K. Sivewright, Esq., for Beauty of St. John's-wood, Cerito, and Cleopatra. The prize offered for the best forced plant of a hardy tree or shrub was gained by Mr. Sleigh, gr. to the Lord Advocate, with a fine specimen of Andromeda floribunda. For the 12 finest Hyacinths in pots, six single and six double: 1st to Mr. Douglas, gr. to Sir J. Dick Lauder, with Prince Albert, Voltaire, Lord Wellington, Duke of Wellington, Grande Vidette, La Candeur, Perruque, Anna Maria, Triumph, Blandeisa, Gros Herzogen, and Grand Lillas. For the heaviest six stalks of forced Rhubarb: 1st to Mr. Henderson, Cargilfield, for Victoria, all from one plant, and weighing upwards of 9 lbs.; 2d, to Mr. Goodall, gr. to the Marquis of Lothian, for five stalks of the same variety. For the best three stalks of Celery, with an account of the mode of culture: 1st to Mr. Sinclair, gr. Tillichewan Castle, with Cole's Superb Red; 2d, to Mr. Henderson, for Cole's Dwarf. Of productions for exhibition only, Messrs. Dicksons and Co. sent two large hampers of Hyacinths in pots. Messrs. Dickson and Sons, also exhibited a collection of Hyacinths, a beautiful Begonia manicata, Dielytra spectabilis, and other plants. Mr. Carstairs produced forced stalks of Myatt's Victoria Rhubarb, along with specimens of Mitchell's Royal Albert from the open ground, without covering or protection of any kind, some stalks of the latter being more than 7 inches long. Mr. Handasyde exhibited a mass of Saxifraga oppositifolia, 3 feet in length by 2 feet in breadth, and completely covered with blossoms; also a basket of spring-flowering herbaceous plants, including Helleborus purpurascens, Sisyrinchium grandiflorum, Colchicum vernum, &c. A silver medal was voted for the Saxifrage. Mr. Methven, Stanwell-lodge, sent Hyacinths, Camellias, Heaths, and Epacrises. There were beautiful plants of Milla uniflora and Dondia Epipactis from the garden of Dr. Neill, and a beautiful Rhododendron from the garden of I. Anderson, Esq. Prof. Syme sent a seedling Epacris, for which a certificate of merit was granted, along with an honorary award to Mr. Reid, his gardener. There were two stands of beautiful cut flowers of Camellias from the gardens of W. F. Mackenzie, Esq., M.P.; and from Mr. Maclachlan, gr. to W. R. Ramsey, Esq., well forced plants of the Cabbage Rose. Mr. Ritchie, gr. to W. M. Innes, Esq., exhibited a pot of the white-flowered variety of Saxifraga oppositifolia, and also a finely flowered double white Primula sinensis. Mr. Burns, Malleny, exhibited a Rhododendron. Hyacinths were shown by J. Aitken, Esq., T. Oliver, Esq., Mr. Nicoll, and Mr. Douglas. Besides these, there were placed on the table fine specimens of Begonia manicata and Chorozema Laurenceanus, also Cyrtopodium Andersonii and Dendrobium cærulescens, from the Society's collection. Mr. Jaffrey, Experimental Garden, exhibited a number of mezzotint figures of Apples and Pears made by him, and Mr. Shanklie sent samples of the hexagon garden net, for protecting fruit trees. Specimens of rough plate glass, and other horticultural articles in glass, by Messrs. Hartley, were on the tables. Eleven new members were elected.

Royal South London Floricultural.—The 14th Annual General Meeting of this Society was held at the Horns Tavern, Kennington, on the 7th inst. M. Sangster, Esq., in the Chair. The report of the committee for the past year was read and adopted. The society then proceeded to ballot for officers for the ensuing year, when R. Seldon, Esq., was appointed treasurer in the room of J. Bright, Esq. resigned, and Mr. J. T. Neville was re-elected secretary. The committee reported that in addition to the annual subscription of the late Queen Dowager, they had received the subscriptions of 213 members, of whom 43 had joined the Society since the last general meeting, and that the total prizes given by the Society during the year amounted to 323*l.* 7*s.* 6*d.* By the auditor's report, which was read, it appeared that there is a balance of 12*l.* 17*s.* 5*d.* due to the treasurer, against which there are outstanding subscriptions amounting to 23*l.*, of which about 15*l.* is considered good, all the liabilities of the Society having been discharged.

Garden Memoranda.

C. B. Warner's, Esq., Hoddesdon, Herts.—We proceed to redeem our promise, made last week at p. 164, viz., to give some account of the Orchid-house here. The glass houses stand on the face of a hill which looks to the west. The range we are now more particularly about to describe consists of two long Vineries, leaning against a wall and facing south; and at a right angle with these, at their lower end, stands the Orchid house—a span-roofed structure, the top of which meets the continuation of the roof of the Vineries in a rafter in the latter, about 4 feet from its top. The houses being on a slope, and the roof of the Orchid-house being run into that of the lean-to Vineries, in the manner we have mentioned, breaks the uniformity of construction, and offers in the interior of this part of the Orchid-house facilities for carrying out the natural style of gardening, which would not have obtained under a different arrangement; and it is this portion which strikes the visitor as being most remarkable, for the rest is merely a common, neatly-constructed, span-roofed house.

Entering from the Vinery, which is quite 4 feet above the floor of the Orchid house, at the ornamental end, one suddenly finds oneself on the top of a flight of stone steps, looking over Palms, Marantas, Orchids, and Ferns, all growing in Nature's wild luxuriance among large masses of rock, whose bases encircle a small piece of water. Immediately in front of the water, and supporting the angular beams of the roof, which meet in the rafter already noticed, are two rustic oaken pillars, 9 feet apart, covered with moss, from among which issue pendulous Dendrobes, Ferns (as Polypodium aureum, Aspidium exaltatum), and Æschynanths, producing a charming effect, while overhead hang Columneas, Æschynanths, huge Stanhopeas in baskets, and other Orchids, altogether forming an assemblage of magnificent vegetation very gracefully disposed, and affording a good example of the kind of arrangement contended for in the leading articles at pp. 147 and 164. A Bamboo reaches from the edge of the water to the top of the house; and on the surrounding rocks we observed Tillandsias, Bilbergias, Maranta zebrina, Dracænas, Begonia hydrocotylifolia, Polypodium effusum, Adiantum formosum, gold and other Ferns, among which was a splendid specimen, 9 feet across, of the Crow's-nest Fern (Asplenium Nidus), whose fronds were 5 feet long and 8 inches wide. A fine tree Fern, 8 feet across, filled one corner; and against the wall, above the rockwork, Polypodium phymatodes, 8 feet high and 7 feet across, was growing in great luxuriance, in company with Acrostichum scandens, a capital wall Fern, some of the pendulous Dendrobes, as pulchellum and Pierardi, and a Passion-flower or two. It may be well to observe that Polypodium phymatodes and the climbing Acrostichum are beautiful objects, on damp, rather shaded, stone walls, to which they attach themselves without any assistance, and they grow so rapidly that they will cover a large surface in a very short time. Anybody therefore who has a stove may possess them, and they are exceedingly clean, being never subject to scale, as some Ferns are. In the water, which is heated by a two-inch iron pipe, were Caladium bicolor, the blue and red Water Lilies, and a few other stove aquatics. Groups of Ferns in pots, consisting of Adiantum formosum, A. trapeziforme, and the glaucous Polypod, surrounded the bases of pillars, &c.; and opposite the ends of the main plant stages were nice specimens of Littæa geminiflora, together with upright blocks of wood placed in pots, and covered with Lycopods, intermixed with Camarotis purpurea and Orchids of that nature. The extreme length of the house is 40 feet, and it measures 24 feet in width. A passage runs round it, and up the centre, dividing the latter into two beds, on which the plants in pots are staged; the latter are placed on rough pebbles, which keep the bottoms of the pots dry and clean. Among the plants here we observed a specimen of the long-tailed Ladies' Slipper (Cypripedium caudatum) just coming into bloom. It has been urged as an objection against such houses as Mr. Warner's, that they afford great harbour for insects, which they no doubt do; but by cleanliness, and carefully watching for them and killing them when they sally forth at night in quest of food, Mr. Williams finds that they may be kept in complete subjection; and the beautiful specimens of plants which the house everywhere contained, fully confirmed the truth of the statement. A dry "retarding" house is attached to the south end of the Orchid-house; and even here, where the walls are irregularly covered with "clinkers" set in cement, no more annoyance is felt from insects than what would be experienced in an ordinary house.

Before leaving the Orchid-house, which is one of the nicest houses of the kind we have seen anywhere, we must not forget to mention that the fragments of rock employed in it, which have all the appearance of stone, are in reality not stone at all, but large masses of spoiled bricks obtained from the kiln, and coated over with Roman cement. These are found to be just as durable as stone, from which, after a short time, it is almost impossible to distinguish them. It should also be remarked, that the glass above the ornamental part of the house is painted over with white-lead, to give shade, without which the Ferns do not thrive.

We will endeavour next week to find room for some account of the other houses, and of the open grounds.

Miscellaneous.

Rose Stocks.—My object on the present occasion is to draw attention to the different kinds of stocks upon which Roses are generally worked in the nurseries—a point of no little importance when we consider that upon the stock much of the future well-being of the plant depends. In the "Theory of Horticulture" we are told that "mere propagation is by no means the only object of the grafter [substitute budder]. Another and still more important one is to secure a permanent union between the scion and stock, so that the new plant may grow as freely and as long as if it were on its own bottom under the most favourable circumstances. If this is not attended to, the hopes of the cultivator will be frustrated by the early death of his plant." This is perfectly true of Roses. Many cultivators take strong vigorous stocks, such as crimson Boursault, Celine, and others, and work on them the delicate Bourbons, Chinas, Teas, &c.; for, say they, "the stocks are vigorous and free growers. See what an amount of root they possess! look at their lungs and stomach, in the form of leaves, to carry on respiration and digestion freely! how rapidly they assimilate the food which is transmitted to them by such powerful feeders!" And upon such stocks are budded delicate Roses. During the first year all goes on well; the stock having been in vigorous health when headed back, the bud is pushed out strongly, and in general many of the sorts I have named will bloom profusely the first season. But will this continue? It will if the variety is a free grower; but should the contrary be the case, it will go back, even more rapidly than it progressed. This is, theoretically, what we might expect, and practice amply confirms the hypothesis. The lungs so much talked about are cut off with the heading back of the stock; the plant, with its thin, small, delicate leaves, has now to digest and assimilate all the gross food forced into them by such a mass of coarse and abundant feeders; the leaves are gorged to such an extent as to impede their healthy action; respiration and digestion go on slowly; and this continues to increase until all the functions of the plant are totally suspended, and death puts an end to its existence. I have frequently heard complaints made respecting the loss of valuable Tea and other Roses, which have been purchased, it may be, at considerable expense; and surprise has been expressed at their early death; but if people would only examine the stocks on which the plants were worked, the fact of their living so long would be more a matter to be wondered at. The Dog Rose (Rosa canina), is the kind of stock which is so extensively employed for Roses in the nurseries of this country. It is almost exclusively used for standards and half-standards, and to an unlimited extent for dwarfs. All things considered, it is greatly superior to every other stock; with the exception of a few, which shall be hereafter noticed, most classes will grow well upon it. Provins, Gallica, Moss, Hybrid Provins, Alba, Hybrid China, Hybrid Bourbon, Damask, Austrian, Damask Perpetual, Hybrid Perpetual, with many of the free-growing Bourbon and Noisette kinds, will grow vigorously upon it. Many of the delicate varieties in the two latter classes, as well as a few sorts scattered through the others, will, however, not succeed upon this stock; but they are scarcely worth mentioning. The Manettii stock claims attention next; it stands at the head of all cultivated stocks (not, of course, including the above), and is very superior to the crimson Boursault, Celine, &c. Its good properties consist in its free, vigorous, and continuous growth; in this latter property it is superior to every other stock, continuing to grow until it is stopped by the winter's cold; it also ripens its wood well, becomes hard, firm, not subject to decay, nor are the shoots gross and pithy. On dry, warm, or sandy soils it is the best of all stocks; I have also seen it succeed well on stiff soils not over wet. It is the best of all stocks for Hybrid Perpetuals, and they force well upon it. It suits Bourbons and Noisettes equally well, and many of the dwarf and delicate varieties of these classes which will not succeed upon the Dog Rose will grow admirably upon this. Teas and Chinas will grow better and live much longer upon it than on either the crimson Boursault or Celine. I must not, however, be understood to say that no Teas or Chinas will succeed on the latter stocks; some of the free growing kinds will do on it, and exist for a considerable time, but they would do better on the Manettii. Many delicate Teas and Chinas, which will live only a year or two on crimson Boursault and Celine, will thrive pretty well upon the Manettii; but they are much better worked upon the Rosa indica (common Monthly), or grown upon their own roots. This stock strikes as freely from cuttings as a Willow. It was introduced from Italy by Mr. Rivers, and is worthy of the extensive cultivation he has given it. The crimson Boursault stock should be used with caution. I am aware that some growers speak highly of it, and have used it extensively; but it is nothing more than a good nurseryman's stock, namely, one on which delicate Roses will grow beautifully for a time, but on which they will soon perish. Many strong-growing Perpetuals, Bourbons, Noisettes, &c., will grow well upon it, though not so well or so long as on the foregoing. This stock is softer, more subject to decay, and, in every point worth considering, inferior to the Manettii; it should consequently give way to the latter. For the beautiful and delicate varieties of Perpetuals, Bourbons, Noisettes, Teas, &c., it is infinitely inferior to Manettii, and should never be used where the latter stock can be obtained. Some few years back nurserymen were in the habit of growing Peaches on what is called the Brompton Plum stock, a very free growing variety, on which the Peach grew beautifully for a season, but in many instances they had commenced decaying before they left the nursery; very few respectable nurserymen grow this stock now. The crimson Boursault occupies the same place as a Rose-stock which the Brompton Plum does as regards the Peach.

Gardeners who would object to have their Peaches worked upon the latter stock, should pause and consider what sort of Roses they would have worked upon the other. Celine is a very vigorous growing Hybrid China. Mr. Rivers considers it to be the best stock for the Cloth of Gold, and it suits many others equally well. In a general way it may be used for the same purposes, and the same classes of Roses, as the crimson Boursault and Manettii; it is very inferior to the latter, which must take precedence of all. Duc Decazes is a vigorous growing Hybrid Bourbon, having many good qualities to recommend it, namely, free growth, firmness, and solidity of wood. I have seen Bourbons, Chinas, and many Teas and Noisettes succeed admirably on it. Rosa indica, or Monthly, I have already noticed. This is suitable for delicate Teas, Chinas, &c.; and if they were more extensively cultivated on this or on their own roots, amateurs would not have so frequently to lament their losses. Blush and other Boursaults I notice merely in order to caution growers against using them; they are at all times extremely subject to mildew, and when worked are liable to decay; indeed, they but seldom grow well. The old Rose, Ornement de Parade, is sometimes employed as a stock in nurseries; it has very little to recommend it, consequently the sooner its cultivation for that purpose is discontinued the better. I have offered these few remarks on Rose stocks with the view of drawing attention to the subject, because of the indiscriminate manner in which stocks are used for Roses. If we could but induce our great Rose-growers to give us the result of their experience, a correct knowledge of this favourite flower would be speedily diffused, and those mistakes (the unsuitability of stocks) put an end to. *John Saul, Durdham Down Nursery, in the Journal of the Horticultural Society.*

Calendar of Operations.

(For the ensuing week.)

GENERAL REMARKS.

THE severe weather which has visited us during the last week will have afforded good cause for self-gratulation, to those who had adopted the course we recommended in guarding the tender unfolding buds of fruit trees; those who have neglected such precautions will do well to put them in practice, lest worse weather should yet come, and at a time when the trees are still less able to endure it. Very great care should be taken at this advanced season to prevent injury from sudden variations in the weather, which is apt sometimes to take even careful managers a little by surprise. Plenty of mats, canvas, and other covering materials should always be at hand, that they may be made immediately useful in cases of emergency.

PLANT DEPARTMENT.

As vegetation is now commencing its summer progress in earnest, one of the most important points requiring attention is, to give all plants sufficient room to develope themselves, without crowding or being crowded by their neighbours. A collection of plants too large for the extent of glass is the common evil of nearly all gardens; and, in consequence of this, they are crammed together during winter to preserve them from the frost. Injurious as this is to their health during the dull months, the evil is ten times greater when they commence their spring growth, and for this reason they must be placed at proper distances asunder without further delay, even if the operation should involve a reduction in the collection; for it is far more satisfactory to all parties concerned to have a few well grown specimens, than several times the number of lanky etiolated plants, not one of which will stand the scrutiny of individual examination. As the spring is so far advanced, much may be done by removing many half-hardy or frame plants to favourable situations in the open air, where they can be slightly protected in case of very severe weather by mats, canvas, or other contrivances; this will make room for some of the hardier greenhouse plants in the frames, where they will be much improved by their close proximity to the glass. The forcing houses, also, as they gradually come into work, will afford room for plants which require a stove temperature. If a sufficient quantity of young stove plants has not yet been propagated, no time should be lost, as cuttings will root with greater facility now than a month or two hence.

FORCING DEPARTMENT.

As Vines are so often troubled with thrips, and as they do such serious injury if allowed to increase, which they soon do to an alarming extent, energetic measures should be taken for their extermination. Fumigation with tobacco is the best method of destroying them; but to render this mode effectual, the following points should be attended to. A quiet evening should be selected for the operation, when the leaves of the plants are quite dry; the house if convenient should be covered with canvas, or something similar, to prevent the escape of the smoke through the laps; during the whole of the next day it should be kept close, and the shading should be kept on, to prevent the necessity of giving air, and also the more completely to retain the fumes of the tobacco within the house. This course checks the revival of some of the insects which were merely sickened by the previous evening's smoking; but to make sure of destroying all, the house should be fumigated again on the second evening. On the second morning the plants should be syringed, and receive air as usual; but if the day prove very hot, a slight shading will be necessary. If pure tobacco be used, it will kill all the insects in existence at the time; but it will be necessary to repeat the process three times, with an interval of eight or ten days between each fumigation, to destroy those which proceed from the eggs laid by the old insects before their destruction. In fumigating houses in general, a board should be fixed over the top of the smoking pot, about six inches above the rim, to diffuse the smoke, that it may not injure the leaves, by coming directly in contact with them, before it has been sufficiently cooled by diffusion through the atmosphere. This plan has completely destroyed the thrips, and we are happy to recommend it to others, as so many are complaining of the ravages of these miniature locusts. Though individually minute, they soon commit fearful havoc, not only upon Vines, but also amongst our choicest stove and greenhouse plants. Even the fruit of Pines is often attacked by these insects, and completely disfigured by them. STRAWBERRIES.—These are generally placed on shelves in Vineries and in similar places to set their fruit; but as a drier atmosphere is necessary, and a free admission of air, while they are flowering, and as it is not always convenient to make the necessary variation in the state of the atmosphere in these houses, it will be better to keep them in the forcing pit until their fruit is set, after which they may be removed to the shelves of the forcing-houses, to mature their berries. During the swelling of the fruit, they should be watered twice a week with liquid manure of moderate strength.

FLOWER GARDEN AND SHRUBBERIES.

Herbaceous plants, which are now appearing above ground, will require a little attention to guard them against the ravages of the snail family. A timely dressing of soot and lime, sprinkled over the crowns of the plants, will not only prevent their depredations on the surface, but, being washed in by the rain, will preserve the bases of the young growths from their attacks also. Box edgings are notorious as a harbour for these plagues, and where beds containing choice plants are thus surrounded, it will be useful to lay a line of the above mixture along the inside, in order to insulate the plants. It will also be useful to hoe and rake the beds, both for neatness sake and to disturb the underground retreats of our slimy friends, so as to expose them to the weather and to the bills of their natural enemies. Biennials (as Wallflowers, Sweet-Williams, Scabiosas) should be brought from the nursery-beds and arranged in their summer quarters; beds of Pinks, Picotees, and Carnations should also be made; these things are invaluable for supplying flowers for glasses, bouquets, &c. All dressed turf should now be well swept, rolled, and, if necessary, mown; it is a great drawback in the present appearance of the pleasure-ground, and a disadvantage in the after-keeping, to allow Grass to grow too long before it is first cut in spring. Where there is a large extent of open lawn to be kept in first-rate order, the horse-mowing machine is an invaluable assistant, as by it the Grass can be cut once in 10 days or a fortnight, at much less cost than it can be done once a month by the scythe. For firm, well-drained ground, the 42-inch machine will be found most economical; but, for softer ground, the medium-sized machine is preferable, as the latter may be worked with a lighter horse, and consequently less damage is done to the turf in damp weather. It is necessary to mention that not more than a fortnight should elapse between the different cuttings, or the work will be more difficult to do, and unsightly when done.

FLORISTS FLOWERS.

DAHLIAS.—Those roots which have been placed in heat will require considerable attention, and as the shoots spring forth they should be cut off immediately below a joint and inserted in small pots filled with sand; placed in a brisk bottom heat they soon strike root. Seed should also be sown directly. CARNATIONS and PICOTEES should be potted off forthwith; we usually plant a pair of layers in each pot; in removing them from the store pot it is advisable to retain the ball unbroken, giving them a slight elevation above the surface, for as the soil settles down they come to a proper level. The layers should be thoroughly divested of all portions of decayed foliage; but we by no means recommend the shortening of the tips, as some are in the habit of doing. AURICULAS must be carefully protected from frost; one and often two mats will be requisite, for a check will prove highly injurious to the coming bloom. Give more water, and occasional gentle showers will prove highly beneficial, in which the plants may be indulged as the trusses rise; at the same time they should never be closed quite, when wet. RANUNCULUSES.—Seed will now be making its appearance; they should occasionally be moistened by dipping a brush in water and sprinkling them; it is a bad plan to use a watering pot for this purpose, as the young plants are often washed out of the soil. TULIPS.—Cover carefully with lace, or very fine net; they will repay the attention, as there will be much competition amongst exhibitors this season.

HARDY FRUIT GARDEN.

Let all training and pruning be assiduously proceeded with, that it may as soon as possible be brought to a conclusion, particularly where the advice given in an early calendar has been followed, by leaving unpruned those fruit trees of which the buds are liable to be injured by the bulfinches. Any trees which are furnished with a tolerable quantity of blossom buds, and are not yet protected, should be immediately attended to. If canvas or netting is not available, evergreen branches must serve as a substitute. In applying them use as many as will protect the blossoms effectually without depriving them of light, and let great care be taken that the buds are not broken or injured in fixing the branches, and also that the latter are fastened so securely that the wind may not be able to blow them about.

State of the Weather near London, for the week ending March 21, 1850, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 27th 1830—therm. 75 deg.; and the lowest on the 30th, 1817—therm. 20 deg.

Notices to Correspondents.

ACANTHODIUM: *R M S.* You will not find seeds of this in the trade. Your only way of obtaining it will be to apply to the possessors of herbaria.

BOOKS: *C K S.* Roberts on the Vine, with the exception of putting carrion into borders.—*A Z.* The "Manse Garden."

EMIGRATION: *A Subscriber.* Apply to the Commissioners of Emigration, London. But no men, not even paupers, are sent out absolutely free of charge.

GLADIOLI: *Constant Reader.* The leaves look as if they had been injured by cold; but it is probable that something is wrong with the roots. The real cause of the evil can only be discovered by careful examination on the spot.‡

HEATING: *J N* Gas is unsuitable for heating glass houses. It burns and dries the air, and renders it unfit for plants, and besides it is always escaping. A small boiler and a set of 4-inch iron pipes run round your greenhouse will prove far more satisfactory.‡

HYBRID VEGETABLE. We have received from *Union* a pod of a seedling Pea impregnated with a speckled French Bean. Having only two seeds he could not spare any this year, but he describes the seed to be of a dingy white, stained with the speckled Bean. It was originally a green Marrow. We fear this is not likely to be useful; but it is a curiosity of a very strange nature, to which we may allude hereafter.

MELILOTUS LEUCANTHA: *K.* It is Bokhara Clover, a very strong-growing variety, and a good bee flower.‡

MICROSCOPES: *J H.* You will have to inquire for Gaudin's microscopes in Paris. If you have no correspondent there, and are not going, you might perhaps obtain one through the agency of Mr. Redfern, Rue de la Paix.

NAMES OF PLANTS: *Dee.* Sisyrinchium grandiflorum.—*C.* Senecio Petasites.—*J T C.* Omphalodes verna.—*A G.* We cannot name florists' flowers.——An accident prevents our answering this week one or two other inquiries under this head.

PEAS: *O P.* Seeds under the name of "Nimble Tailor" were received from Linwood, and proved to be the Early Charlton. The Sabre and Blue Sabre were received from Falla, and the Blue Scymetar from Masters; these proved to be the same as the Blue Imperial. The seeds having been obtained from highly respectable authorities, the synonymes were admitted. If doubts should arise with regard to the identification of the numerous synonymes which appear in the lists of vegetables given in our columns, a statement of such will be duly attended to, as far as possible, in the way you suggest.‖

PELARGONIUMS: *E G.* The whiteness on the leaves appears to be some substance brought by the water employed in syringing them. Their death is probably owing to insufficient ventilation, dark weather, and too much water, either in the air of the house or in the soil, or in both.

POTS: *F P.* They are named 3-inch pots or 11-inch pots according to the number of inches they measure "*across the top.*"

POTTING: *Amateur.* If the plants you have just bought in from the nursery are pot-bound, you had best shift them into larger pots at once, and in doing this you cannot do better than observe the rules laid down by "Pharo," in "Villa Gardening," at pp. 149, 165.‡

SCALE ON ORANGE TREES: *J D.* Washing the trees with water of the temperature of from 130° to 140° will perhaps kill it at once; but if any still remain give them a second dose of hot water.‡

STUDY OF BOTANY: *G V.* The text-book used by Dr. Lindley for the juvenile class of botany in University College is his "School Botany" No other is required by the *beginner.* All sorts of apparatus, such as paper, lenses, drying-boards, &c., can be purchased on very reasonable terms of Mr. R. M. Stark, 1, Hope-street, Edinburgh, who will furnish lists upon application.

THE TREE ROSE: *W D.* At the request of numerous subscribers the price of this work is now reduced from 4*s.* 6*d.* to 3*s.* 6*d.*, post free; it can be forwarded to any address by a Post-office order being sent to James Matthews, at the Office of this Paper.

TROPÆOLUMS: *W W.* T. tuberosum is, we believe, quite hardy, but we fear it will not bloom with you. Try pentaphyllum, or, still better, speciosum.‡

VINES: *J M R.* You have poisoned your Vines with your salt. That is all. To recover them you must take them up carefully, wash the roots quite clean, and remove all the soil before you replant them.

MISC.: *T W.* Silver sand is a very different thing from sea sand. You may strike Fuchsia cuttings in the latter, if you wash it well first, to clear it of salt. Start Anomathecas now, and take down your cellar-wintered Geraniums, remove the dead tops, pot them, and prepare them for planting out after all danger of frost is over.‡—*J W.* Start your Gesneras in heat now—potting in a mixture of loam, peat, leaf-mould, and silver sand. We never put prices on articles or recommend dealers.‡—*Alton.* The Water Lemon is a stove plant, and is all the better for bottom heat. The cultivation of the Tuberose is given at p. 101 of our volume for 1847. The Coniferous plants are as hardy as Larch or Scotch Firs. Cornus macrophylla is probably too tender for England.—*A Subscriber.* The number of Chestnuts required to plant an acre of land will depend upon the distance at which you place them. There is no difference between English and Spanish Nuts. Sow them in seed beds, about 6 inches apart; let them stand till the autumn. Then lift them, shorten the tap root, and replant them in rows, in light rich soil. After they have stood two years, cut them down in April; single off the shoots to the best, and by the autumn you will have nice straight plants ready for putting into a plantation.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

Corn and Grass Manure, per ton	...	£10	0 0
Clover Manure, do.	...	11	0 0
Turnip Manure, do.	...	7	0 0
Superphosphate of Lime	...	7	0 0
Sulphuric Acid and Coprolites	...	5	0 0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

LAWES'S PATENT MANURE.

WILLIAM E. RENDLE AND CO., Plymouth, are Mr. Lawes's Wholesale Agents for the Sale of his MANURES, and can supply them at Mr. Lawes's prices, delivered at his Factory, Deptford Creek.—Apply to WILLIAM E. RENDLE and Co., Union-road, Plymouth.

GIBBS' GENUINE PERUVIAN GUANO, *warranted*, at 9*l.* 15*s.* per ton. In the Import Docks.

POTTER'S GUANO.—This effective MANURE, now greatly Improved, is confidently recommended as a Dressing for all Spring Crops. It is equal to Peruvian Guano, and 25 per cent. cheaper. Also SUPERPHOSPHATE of LIME, GYPSUM, and SULPHATE of AMMONIA, all of guaranteed quality, and Cheaper than at any other establishment in town or country.

Factory, 28, CLAPHAM ROAD PLACE, LONDON.

GENUINE PERUVIAN GUANO, direct from the Importer's Stores, LINSEED CAKES, and all kinds of Artificial Manures, may be had at London prices, for Cash, of Messrs. ODAMS and PICKFORD, 15, Mark-lane, London.

CORN MANURE.

BLASHFIELD'S PATENT COPROS.—A new Manure for Corn and other Crops, prepared from the nitrogenous matter deposited on the banks of the Thames, in combination with other substances essential for the growth of corn, &c., price 8*l.* per ton. Sold, in a finely ground state, at No. 3, New London-street, Mark-lane; also, at the Works, Mill-wall, Poplar; Waterloo Dock, Lambeth; and No. 1, Praed-street, Paddington Basin.

PATENT COPROS, for Corn crops, also for Turnips, &c.; Superphosphate of Lime, Gypsum, calcined and saturated with liquid manure. CEMENT for Liquid Manure Tanks, Malt House Floors, and Barn-floors, manufactured by J. M. BLASHFIELD, successor to Wyatt Parker and Co., Original Patentees of Parker's Cement. Established 1796. Drain Pipes, Tiles, &c.

CORN MANURE FOR WHEAT, BARLEY, OATS, BEANS, &c., &c.

THE LONDON MANURE COMPANY most confidently recommend the above, as they are daily receiving very satisfactory accounts from parties who used it with great success last season. It will be found fully equal to and much cheaper than Peruvian Guano, and is not so liable to produce so large a growth of straw. Price Seven Guineas per ton, 3 cwt. per acre. They also beg to offer their Concentrated Urate, Superphosphate Lime, Nitrate of Soda, Sulphate and Phosphate of Ammonia, Fishery and other Salt, Gypsum Sulpburic Acid, and genuine Peruvian Guano. To insure this free from adulteration, all purchasers can receive it direct from the Warehouses of the Importer.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.

Country Dealers and Agents supplied.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed charged, from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.

HOT WATER APPARATUS AND HORTICULTURAL BUILDING.

W. HILL begs respectfully to announce that his improved "FLUE BOILER" may now be had in sizes to suit every description of Apparatus, from that of 100 feet to 2000 feet of 4-inch pipe. Improved STEAM BOILERS, from one-horse power and upwards, adapted either for stationary or portable engines, and guaranteed to be most effective.

Every description of Horticultural Building constructed upon the best principle. Buildings of any kind heated by hot water.

*** A liberal Discount to the Trade.

W. HILL, Horticultural Works, Greenwich.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street.

LUCERNE.—JUST IMPORTED, a large quantity of excellent new Lucerne Seed, price 80*s.* per cwt., in quantities not less than 28 lbs. Also the best Perennial GRASS SEEDS AND CLOVERS FOR PERMANENT PASTURE at very low prices; and SUTTON'S RENOVATING MIXTURE for improving old Pastures, price 1*s.* per lb., consisting of the finer sorts of Perennial Grasses and Clovers, 8 lbs. to the acre.

Also Finest Lawn Grasses; Ashcroft, Liverpool, and other Swedes, White Belgian and other Carrots, Yellow Globe and other Mangolds, True Italian Rye-grass, Drumhead Cow Cabbage, Kohl Rabi, &c.

Address: JOHN SUTTON and SONS, Reading, Berks.

*** *Carriage free by Great Western, South Western, or South Eastern Railways.*

MESSRS. NESBIT'S CHEMICAL AND AGRICULTURAL SCHOOL, 38, Kennington-lane, London.—A sound practical knowledge of Analytical and Agricultural Chemistry, Geology, Surveying, Levelling, Railway Engineering, &c., may be obtained in Messrs. NESBIT'S Academy, in addition to a good modern education.

Mr. NESBIT'S works on Arithmetic, Mensuration, Gauging, Land Surveying, English Parsing, &c., are published by LONGMAN and Co., and may be had of all Booksellers.

The terms of the School can be had on application either personally or by letter.

HYDRAULIC ENGINES, WATER RAMS, &c., on Improved Principles; Engines worked by Steam or Hydraulic power, to raise from 1 gallon to 1000 per minute to a height of 500 feet, and from a depth of 900 feet. Douche, Vapour, Hot-air, and all other kinds of Baths. Buildings, Conservatories, &c., heated by Steam, Air, or Water. Boring, Sinking, and Collecting of Water, &c. Towns supplied.

Direct to JOHN LEGG, Cheltenham.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers; Office, 70, Strand, London.

Works, Sumner-street, Southwark-bridge-road.

IMPORTANT TO AGRICULTURISTS.—COLLECTION AND DISTRIBUTION OF MANURES.

STRATTON'S AGRICULTURAL REPOSITORY, BRISTOL.

STRATTON, HUGHES, AND CO., have now ready their PATENT TUMBLER CART for the collection of Night-soil and other offensive matters; also their Iron Mill, to be worked by horse-power, water-power, or steam, for mixing and incorporating Nightsoil with Charcoal and other deodorisers. The Tumbler Cart has an iron body with a close cover; can be fitted if required as a Watering-cart, with a Valve and Delivery Pipe for distributing water or liquid manure, and also with an Apparatus for distributing dry manures in any given quantities per acre.

STRATTON, HUGHES, and Co.'s Tumbler Carts are used for scavenging purposes in Manchester, Bristol, Worcester, Harwich, Rochford, Cardiff, &c., and they are now building them for Chester, Oxford, Huddersfield, &c., besides many for Agricultural Colleges and private individuals. STRATTON, HUGHES, and Co.'s new illustrated Catalogue of Carts, Wagons, and Agricultural Implements will be forwarded to any address on receipt of 1*s.* 6*d.* in postage stamps.

The Agricultural Gazette.

SATURDAY, MARCH 23, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, March 27—Agricultural Society of England.
THURSDAY, — 28—Agricultural Imp. Society of Ireland.
WEDNESDAY, April 3—Agricultural Society of England.
THURSDAY, — 4—Agricultural Imp. Society of Ireland.

"WASTE NOT—WANT NOT." It is an old maxim; but, though ancient, it was never more useful than at the present day. In these times of competition and frugality in all departments of industry, it is the spirit of all improvements; and in agriculture, manufactures, and government, it is found to embody itself in cheaper methods, saving systems, and financial reforms. Economy, or the prevention of waste, is what we must rely upon for making up the deficiency in the difference between our expenses of cultivation and the value of our produce, when both shall have fallen to the lowest point.

How comes it, then, that farmers, though otherwise thrifty, should be found to violate the above time-honoured and now momentous truth whilst struggling against a falling market, especially with respect to their manures? Certainly it arises in a great measure from ignorance of the facts of the case. But have they not books, pamphlets, and societies? True—these are doing a great work; few, however of the smaller occupiers read our agricultural publications, partly owing to their dearness; and clubs for diffusing the knowledge of husbandry are unhappily rare. We must look to private endeavours; "example teaches more than precept," and one successful adopter of printed recommendations will have a host of imitators around him, though the sources from whence he derived his information be carelessly neglected. We have known men who were advised by others to sprinkle their manure-heaps with dilute sulphuric acid, because from several trials they "had found that the dung was wonderfully improved at a trifling expense;" they had *read* of the advantages to be gained by applying sulphuric acid or gypsum to manure, but had never set about using it; a word, however, from a neighbour, who had actually profited by the practice, determined them at once to adopt it.

The value of good manure and the best methods of preserving it are old subjects; and it is not because the better modes of management are undetermined that this source of the farmer's wealth is so grievously neglected. The sewerage of towns is still allowed to depart unused for the fertilising purposes for which it is available, and a great economical improvement in agriculture is thus completely lost. As regards the manure of the farm-yards, the greater part of the men who should have long ago commenced the more profitable systems of management are yet doubtful as to their adequacy, and require, upon contiguous farms, ocular pecuniary proof of their efficiency, before they will venture an experiment. And agricultural journals must therefore continually urge the more reflecting portion of the agriculturists at once to step forward as fuglemen. In no better way can this be effected than by placing before them the best plans to be pursued, with accompanying reasons for recommending them. Much is wasted in the *manufacture* and *preparation* of manure, and an incredible quantity of material is actually passed over, or else thrown away, of which enriching compounds might be easily and profitably made. This point involves a consideration of box-feeding, manure-reservoirs, urine-pipes, Linseed-food, mown fodder, &c. Another kind of waste is in the *application* of manure, leading to a notice of ridge culture, top-dressing, &c. We shall now, however, confine our remarks to waste in the *means employed for the preservation* of manure. In travelling through any agricultural district, even in the first-class counties, judging from the majority of the farmsteads, it really seems as if *no means at all* were being taken to preserve manure; and muck-heaps by the road side, exposed to evaporation by the sun and wind, and to the frequent washings of the rain—ponds black with the drainings of the straw-yards — yards entirely open, and receiving, in addition to the rain-water that falls upon their whole area, the drip from great barn and stable roofs; all bear witness of the little worth which is commonly assigned to the husbandman's best treasure.

We observe then, that, after the general way of keeping manure, there is a waste *downwards*. Fermenting farm-yard dung abounds with all the salts and mineral ingredients that a plant requires, and as these are chiefly yielded in a soluble state, they can be washed out from the straw and solid portions of the mass. Chemical analysis shows that the drainings of dung-heaps are exceedingly rich in these useful substances; and common sense therefore decides upon the advisability of either preventing this soakage or preserving the liquid which thus drains away. To effect these objects let the yards in which the manure is to be accumulated be properly "dished" and bottomed. The ground after becoming solid will not permit much of the liquor to pass away. Let the roots, weeds, &c., cleaned out of the fields be placed upon this bottom, in order to absorb the juices of the superincumbent dung. On no account let the yard be lowest at one side, lest the precious liquid escape; but in the centre construct a tank, or else lay a covered drain from this point to a covered cesspool outside the yard, and let any fluid which may drain into the receptacle be either pumped up upon the dry surface straw, or carried in buckets and thrown over it when the manure is being "turned" in spring. This may be done by those who object to the expense of carting the liquid manure to the land from which Tares, Clover, or other green forage has been cut for the purpose of soiling. Water and air being necessary to the progress of putrefaction, it is not desirable to exclude all moisture from the manure while in course of formation; but on the other hand, if every drenching shower and the full heat of the burning sun be suffered alternately to weaken and waste the soluble and aeriform particles of the dung, a considerable loss is obviously incurred. Therefore where "Auchness" receptacles and reservoirs are not obtainable, it is well to cover in a large proportion of the straw yards with open sheds, which of course will be of little service unless "spouted." The rain which descends upon the remaining area will always keep the manure sufficiently wet, especially when the cattle are allowed a proportion of roots with their dry food.

There is likewise a waste *upwards*. The food for vegetation contained in manure is liable to escape, both in a liquid and volatile form, whilst the much greater bulk of comparatively useless carbon with which it is united remains subject to no such diminution. This arrangement of Nature seems to thwart the farmer in a vexatious manner; but the same substances have other distinct properties that tell a little in his favour—the less valuable ingredients may be dispelled by fire, while the requisite chemical food will remain as ash. In Mr. HOSKYN'S Introductory Essay to the "Cyclopædia of Agriculture," it is hinted that in future times some means of dispensing with the labour of carrying about the useless load of carbon may probably be resorted to; but at present it appears very unlikely

that a farmer should burn all his straw-yard manure, having first completely drained and dried it. Perhaps the same inventive faculties which have extracted the "quinine," dispensing with the grosser parts of the Peruvian bark, will, ere long, light upon the idea of purging farm-yard manure by a simple process and obtaining all its virtues in a concentrated and most portable form. As it is, we ought to use every method to retard the flight of fertilising matter from the manure. Fresh cow-dung undergoes in 40 days a loss of one-fifth of its solid matter; and if horse-dung be left in a heap for two or three weeks, it evolves much ammonia, and scarcely seven-tenths of its original weight will remain. Ammonia, which is of the greatest value in the soil, readily and continually escapes and ascends from exposed manure in the form of gas. The falling rain washes it out of the atmosphere, and brings it down again to the earth. In this state it is carbonate of ammonia, or "common smelling salts," very volatile, as everybody knows; but this may be easily changed into sulphate of ammonia, which does not quickly volatilise, or rise into the air. To effect this, gypsum (sulphate of lime) or sulphuric acid may be employed. Probably one of the best preventives of this kind of waste is the placing of layers of soil, refuse of ditches, or other material, between alternate layers of manure in constructing the muck-heap, and then covering the whole with a light coating of earth—by which the gases will be in a great measure absorbed and arrested. In the yards, and also in the hovels when box-feeding is practised, the evaporation is hindered by the trampled upper stratum of bedding. The dung, when removed from the feeding-houses and made into a suitable heap, besides being mingled and covered as above, may be sprinkled with diluted sulphuric acid—say one pint of acid to seven or eight gallons of water.

The erection of new-fashioned farm-buildings and even of spouted sheds is often an insuperable obstacle to the good management of manure, owing to the reluctance of many landlords to do anything for their tenants; and the apparatus of pipes, pumps, covered dung receptacles, liquid manure carts, &c., are of too costly or too questionable a nature to ensure a general adoption by our present British farmers. In most cases, however, the dishing and bottoming of yards, the digging of mere drainage tanks, and the proper formation and treatment of muck-heaps, are matters which concern the tenant only, and could be easily accomplished by only a little extra care and labour. Good managers may, perhaps, ridicule these plain remarks as being what everyone knows and practises: not so! the *generality* of farmsteads in most counties exhibit a vast neglect of such simple means of preservation; and at a period when "agricultural distress" has become exceedingly distressful every mode of alleviation is important. These things have assuredly been known long enough, they have been reiterated until the agricultural press is well-nigh wearied of them, and why then are they not more widely appropriated to the individual benefit of approving readers? *I. A. C.*

DRAINING MEMORANDA.

THE surprising amount of benefit derived from draining land properly, that previously had no outlet for water, offers such irresistible evidence of its utility, that the most devoted adherent to old customs, the admirer of "grips," the stickler for rigs and furrows, high, wide, and sweeping, is smitten with a desire for improvement. No matter whether he or his landlord is to provide the needful; but it is of consequence that a fall should be obtained, that no more tiles should be used than are necessary, that they should be laid deep enough, that the best outfall should be selected, and proper attention paid to the composition of the subsoil. It is true that these conditions of draining might be complied with by an engineer, and as soon as the drains got out of order or the least addition or alteration was required, an engineer might issue directions to put all right; but the fee for this farm physician cannot be always spared, and it is questionable if hired intellect in such cases is preferable to the awkward attempts, the failures, and finally the hard-earned experience of the practical man who chooses to set his wits to work to devise the best means of encountering difficulties. And fortunately a few general rules are sufficient to secure an efficient clearance of water; the first object should of course be to find the lowest part of the field, then the lowest accessible level at the edge of the field. I go frequently through a field where above an acre descends to a sort of cavity from which there is no escape unless the tenant chose to cut an outfall 10 feet deep at least (for 200 or 300 yards), through the lowest part of the surrounding eminence; this is an exception: the best plan in such a case would probably be to run a few short drains into a pond or soak well in the centre, but it more often happens that in a large field there shall be midway a slope that requires one deep main drain, or a great portion of the field, by the sponginess of this hole, remains imperfectly drained; every part suspected of retaining moisture should be tapped. You may then, after such draining, safely proceed with the process of levelling the surface, for if a natural drainage is established with well-laid tiles, moderate attention will maintain it for any period. It cannot be denied that the safest plan, particularly in our level country, is to find out to an inch how much fall you can obtain by spirit level or finely adjusted implement; but one well executed drain in wet weather will discover by the course of the water near enough to determine how deep you may go, thence the distance between the drains; if done in dry weather and no water flow, even with the aid of a theodolite, the bottom of the drain is at the mercy of a (perchance unskilful) workman. A brick-layer's level should be brought into action, and with careful use would be found nearly as good as the admonitory ripple, which may veil a quicksand, and into which the tile may incontinently sink and interrupt the efficacy of the drain.

I came into occupation of, among other pieces, a 14 acre field last year; the former tenant had drained it, and there being no running water at Michaelmas, it was valued to me as an unexhausted improvement. The rains came, and the land appearing to be uncommonly wet, I took the main drain up, through which the water seemed to run well. I found the running water proceeded from a dike at the upper end, and on examining the side drains, of which there might be about a dozen, not above two or three gave passage to any water at all, and very little from them. The tiles, 3 inches wide, were many of them so far apart you might get your finger between them; they were not more than from a foot to 15 inches deep (although with the same outfall I have now sunk them 3 feet, 4 feet, and in one place 5 feet deep) and 3 yards from the point of contact with the main drain; they were, at a lower level than at the mouth, nearly choked with a muddy deposit, and instead of running at right angles with the main drain, they were placed some at acute and others at an obtuse angle to the line of fall, and diverging irregularly into the field. I have the tiles for my money, and I shall be at the expense of relaying the whole. I saw two years ago another remarkable instance of a waste of tiles and labour by the proprietor, who was also the occupier; the tiles were laid not more than from 6 to 9 inches below the surface in a Grass field, and they were done in squares; the water stood in the drains before the tiles were laid, and I could not discover an outfall, except into a sort of pond or cesspool, from which proceeded no other channel. Now, if these people had only been commonly careful, had only applied the very rudiments of such knowledge as is deemed requisite in any other calling, had employed common tools with common sense, and thought ever so little upon the phenomena which attends any rational trial of drainage, they might, with the aid of hints from friends, and the thousand channels of information now pressing upon them for conviction and approval, have turned to account their little stock of science, and obtained a motive for striving for greater profit, which would have acted as an example to others and spared them mortification and disappointment. In all fields there should be at least one main drain, more than one will depend upon the size of the field, the irregularity of the surface, and the amount of water derived from springs or other sources; I would gladly lay down large main drain pipes in a ditch I have made to receive the water flowing from other land, but a neighbour has availed himself of my deepened water course so as to send such a current down after a heavy rain that no pipe would convey without the risk of blocking up the smaller side drains and flooding the whole arrangement. I shall in this case, at some future time, have to lay down two main drains within a few feet of each other, one connected with the small drains of the piece itself, and another to take off the outpourings of my over-running friends.

A word on subsoil. It often happens here that a vein of shaly limestone crops out and requires the pick-axe to penetrate it,* the man of task-work grumbles, complains of his arms being jarred, and will not if he can help it go deep enough; an extra small bounty will make all straight, and should not be withheld, for the efficacy of the whole scheme is at stake for a few feet of hard rock, and as it is generally dry work, the spirit or common level with a long straight spar should be in constant requisition; alternating also with tough clay, suddenly appears sand or silt, down goes the tool, the sides fall in, the spring gushes forth, and you are floundering in a loose semi-fluid; a barrowful of slaty stone is necessary to preserve the integrity of the passage, and should be packed with the greatest care: the best tiles for such unsolid earth is the flat-bottomed pipe, of which we get an excellent article from a brick-kiln at Woodstone. They are of uniform texture, of good substance, and straight; they are also brought by water from Ramsey: the round pipe-tiles are perhaps as good for clay, and are something cheaper. There are other kilns in the neighbourhood, but, whether from a defect in the material or workmanship, they offer no security for permanent drainage, being many of them mis-shapen and easily broken, consequently they will not bear pressure, and the channel will be distorted, lay them as you may. A well considered plan is of the first importance, and to have the work executed by skilful and conscientious men is also necessary; the best materials you can obtain is the wisest economy, and a master's eye to scan irregularities, approve regularity, smooth obstacles, and finish effectually, can only superintend where intelligence is exerted, where diligence is felt, and where patience and liberality bring all things "in tune." *J. W., Peterborough.*

* Only last week a great number of good workmen from all parts of the country competed at Upton for prizes offered for draining by our Agricultural Society; the work was distributed by the stewards, and was executed with skill and spirit until about the last "draw" was to be taken out, when, to the mortification of all, it was found they had to penetrate several inches of shaly limestone; this was new work to most of them, and as it had not been anticipated by anyone, proper tools were wanting, and scarcely any could finish the drains within the prescribed time.

THE BRICK AND TILE MANUFACTURE.

WHILE the raising the clay is in progress, it will be proper to commence operations for building a kiln (if one is to be used), erecting sheds, selecting a pipe tile machine, fencing the yard in levelling the ground for brick making, &c. On the point of kiln building much might be said, but it would hardly fall within the limits of such papers as these to do more than point out the prominent considerations affecting the question. Is a kiln necessary or not to burn tiles? I think it is, but I would not here advocate the erection of an expensive building, such as is seen in sale yards; a very much slighter building will suffice when the yard is established only for temporary purposes. If bricks alone are to be burnt, I think a kiln may be dispensed with; but I shall defer giving any description of the method of burning in clamps for a future period. There are two descriptions of kilns in general use, the one sunk somewhat into the ground, having long furnace holes opening on one side only, and having furnace bars running from these openings completely across the kiln, with ash pits below, and requiring a long shed equivalent to double the length of the furnace holes to be erected in front of the openings. The advantages of these kilns I believe to be these—less coal is consumed, and less bricks are used in building it, as the part below ground need not be of that thickness which without the support of the earth it would require to be. The shed might be of rough wood, the eaves touching the surface soil, and the sides constructed to keep the ground from slipping in. The iron work for the furnace bars used to add most materially to the cost of these kilns, being made of thick cast iron, under the impression that such resisted the perishing effect of the heat. It is found however, and I speak from experience, that thin bars are the more durable, and I recommend ⅝ by 2 inch wide bars of wrought iron, running the full length of the furnace hole, and resting at every 2 feet on bearers of the same thickness and width, set edgeways, as a most economical and effective arrangement. Every other bearer should have short ½ inch square stubbs welded on its upper edge, for the purpose of holding the bars apart and admitting the draught. The objections to this kiln are, that some sorts of coal are not proper to burn on bars. The other sort of kiln, built on the level ground, is in very common use; its walls must be of considerable thickness below, and from so much of its surface being exposed to the wind, I conceive that much waste of heat is occasioned. In this the furnace holes are narrow, and are on both sides of the kiln; the coal is burnt on the ground, those that burn to a white ash being requisite for the work. Supposing that no stone fit for resisting fire be on the property to be drained, some bricks must be procured, and I should, for temporary purposes, construct a kiln partaking somewhat of the character of both the above. One with six holes in each side, to burn coal on the ground, and having a low arched doorway at each end, one doorway level with the rising ground at the upper end of the kiln, and the other 6 feet high, reaching to the very bottom at the lower end. The ground must be excavated along the sides to the width of the kiln on each side, and two lean-to sheds be built against the sides. The sides and roofs to be made of rough strong stuff, and on them should be placed, against the kiln, earth, with layers of bushes to prevent it slipping down.

The shed for tile making may be constructed very cheaply, the sides of rough post, 8 feet asunder and 6 feet out of the ground; the width of the building should be 12 or 14 feet clear inside, the length about 90 feet. Some spars laid on the plates, and on them hedge-stuff or furze, packed well, and rough thatched, with the eaves hanging well over, make a good roof. If an old pan-tiled lodge is coming down, borrow the pantiles for a few months, and with some Larch poles a cheaper roof and shed may be made than by drawing hedge stuff about. The sides must be wattled, not too closely, with Blackthorn or any straight wood. Along the full length of the shed, as soon as ever it is erected, on either side, under the drip, dig a good narrow open ditch, throwing the earth well away that comes out, or it will check the air. As close to the line of posts as it can be got, inside the shed, must be cast up a neat table of dry earth, perfectly level, 28 or 30 inches wide, and 4 inches deep, with a smooth coating of sand on the surface of it. Between the two tables in the middle of the shed, the ground must also be levelled and smoothed, for the machine and barrows bringing clay to travel on. Shelves are perfectly unnecessary for making any sort of draining tile. The shelves for pantiles, made with common laths and bricks, I will describe hereafter. Scragg's tile machine is an excellent tool and very strongly made. Williams, of Bedford, makes a very good machine, and its low price is greatly in its favour; for although it does not produce in a given time so many pipes as its higher priced rivals, still it will be found that its powers of delivering tiles are sufficient for a very large demand: indeed, so much attention has of late years been given to tile machines, that their capabilities of supply, if fully exerted, are larger than

yards have room for. The stage on which the tiles are cut to their length ought to be long enough to admit of four lengths at least being on it at one time ; this gives work to the carrier away, while the machine is stopped for filling with clay ; besides, the cutting close to the die causes the tiles to issue unevenly.

With regard to fuel, peat or wood may do for drying, but the full fires are the best made with coal. About eight tons of coal will be consumed in a kiln charged with 9000 bricks and 40,000 of 2 inch pipes, or a ton of coal may be reckoned to dry and burn 3000 or 3300 bricks, according to its quality and the nature of the clay. It is advisable to compute what quantity of fuel will be required for the year, and make one contract for the supply, to come in at stated periods. *A. P.*

(To be continued.)

OXEN ON BOARDED FLOORS.

I PROCEED to detail the progress of my experiment. My Warnes's boxes, 8 feet by 9 feet, contain comfortably a pair of bullocks, weighing when fat from 40 to 50 score. Four of the boxes are now covered with planks 2½ feet wide 2 inches thick, with an open space of 2½ inches between each plank. Six other boxes, 2 inch openings and 3 inch planks. As soon as the bullocks were transferred to their new stage they seemed quite astounded ; their performance was pitiable and ludicrous. The sense of danger and insecurity was very apparent, and they seemed afraid to move. Still their appetite did not fail them ; all their excrement, solid as well as liquid, passed readily through the openings into what was formerly their bed. But, would they lie down ? Certainly not. For 24 hours they resolutely maintained their standing, one only excepted. I then spread a light forkful or network of straw under them, and in a few minutes they were all comfortably at rest. The straw soon worked through the openings, and now for the last fortnight they repose comfortably on the bare boards. The bullocks on these open floors are cleaner than those on the straws, although the former are never swept. The heavy pressure forces the liquid to the surface through the layers of our long glassy reedy Wheat-straw, and keeps the animals wet. It probably is not so with soft Barley or Oat-straw. When the open boards are first tried, there is nothing pleasing to the grazier's eye, especially when compared with the unlimited supply of the ordinary straw sheds. The edges of the boards are new and sharp, and the frequent lifting of the foot indicates fear and discomfort. In lying down and rising up the sharp edges probably give pain, but in two or three weeks all this passes off, the edges get smooth, and you will find your animals lying in various and easy positions. The 2 inch openings and 3 inch laths I prefer to the 2½ openings and 2½ laths. The former are easier to the animal's feet, and, besides, although the foot is 4 inches wide, the hoof is wedge-shaped from front to back. For calves, I find 1½ inch openings answer well.

I attach great importance to these open floors ; they will enable us to keep almost any quantity of stock. The manure requires no turning or fermenting, there is no expense of littering or frequent removal, and no loss of ammonia by fermentation. The comfort is great in every respect. Some of my pigs and sheep have been six weeks over my liquid manure tank without the slightest symptom of ill health, although I feared it when I made the trial. Gypsum is sown on the boards every morning. Burned earth is an essential auxiliary to boarded floors ; although I burned 1800 cubic yards last year, unfortunately I did not reserve enough to carry me through the winter. Next season I shall slightly thatch a few of the heaps, to keep them dry, ready for absorbing the winter's supply of manure in the boarded boxes. Gypsum is another necessary appendage to this system. A little sprinkled every morning on the boards is highly necessary and beneficial ; about a peck to 10 bullocks. Every manger should have in it a large lump of rock salt, and a water trough always supplied—the animals will not drink more than is proper for them. The same remark applies to pigs and sheep : with horses, a little discretion is required, should they come in over-heated.

The following instance of the effect of salt is interesting. Six store bullocks from marshes and straw-yard were purchased and placed in three boxes. The manger of one box contained a large lump of salt. The other two boxes, being just finished, had none. The boys who attended them observed that the two which had salt ate freely, whilst the other four scarcely would look at their new food under confinement. I observed that the two having access to salt were constantly licking it. We are using Cabbage as well as roots. Now I do protest against giving fattening animals roots or green food enough to make them purge. The state of their dung must be our guide. When about the consistence of thick batter, having a certain appearance of cohesion, we are right, but when it falls in a weak splashing condition, indicating diarrhœa, the animal cannot thrive, any more than ourselves under similar circumstances. I have great difficulty in restraining my worthy old bailiff in this matter, the old custom hereabout being to cram them and scour them with an unlimited supply of "green wittles." A very moderate quantity of Cabbage is sufficient, and we seldom exceed 1 bushel of roots daily to each bullock. The remaining food consists of fine cut straw and hay chaff sprinkled with Barley and Bean-meal, and soaked crushed Linseed soup poured over it. If there is a disposition to scour, the roots or green food are withheld for a day or two It frequently happens that confinement and good living cause the newly purchased animals to rub excessively. We immediately, in such cases, administer a pound of Epsom or Glauber salts in about a quart of water. This is repeated, if required, in a few days. This allays the excessive heat and irritation of the skin. If an animal looks dull and does not feed well, the dose of salts is administered. Very poor animals are sometimes lousy ; wash well with tobacco-water, to remove them. We find no inconvenience from having two horned bullocks in one box ; although one will probably be the master bullock, we never can discern any advantage in its condition ; this is because both have enough food, were they scantily supplied this system would not do. It is very necessary to question your stock-man daily as to the condition and health of the animals, as they are apt to forget to tell you if an animal shows a deviation from his healthy habits.

Animals arriving from a long journey should have their feet well washed out with strong salt and water, with a ready access to water, and a lump of salt to lick. A dose of salts tends to remove their feverish symptoms. In conclusion, where 6 to 10 sacks of meal are used daily, I consider a steam-engine indispensable, especially as there is in addition so much chaff cutting, pumping, Linseed crushing, and threshing. The mere convenience of its sack tackle is considerable. N.B. I mentioned before that the thickness of the yellow deal is 2 inches. There should be no knots in it, or the weight of the oxen might break it. If slated roofs are too warm in summer, they have the advantage of transmitting heat in spring and autumn, when it is a desideratum. *J. J. Mechi, Tiptree Hall, Kelvedon, Essex.*

Home Correspondence.

Roots per Acre.—A correspondent states that an acre will contain 4840 plants at 1 yard apart, and so it will do if the plants are placed opposite each other, but if each plant be placed in the interval between the two in the adjoining row, or what is termed *quincunx*, an acre will contain 5588 plants, and the distance from row to row will be a trifle over 2 feet 7⅞ inches. *Lusor.*

Cattle Insurance Company.—There are some poor men in my neighbourhood, who have one and two cows each (of small value, some 8*l.* or so), who insured them in 1848, with the Farmers and Graziers' Mutual Cattle Assurance Association, for one year only ; they have now been called on to pay 30*s.* each, to make up losses of the association, it is said. The men were quite ignorant of the rules of the association, and did not (many could not) sign them. They are honest and willing to try and pay what is due, but they certainly considered they would only have their first premium to pay, and had nothing more to do with the society, and so the agent here told them. What appears most unfair is that these poor men with only one cow of little value is called on to pay for that one cow the same sum as large farmers, who have a whole herd insured, and only called on to pay 30*s.* also. They have asked me for advise (a small farmer), could you kindly tell me what to advise them, whether they must pay the 30*s.* or not ? *M. Y.* [We know of large insurers who have not been so called upon : and this, with the obvious injustice you allude to, would make us suspect the demand. But you had better obtain the advice of an attorney.]

On Brewing.—The inquiries of "Cerevisium" having received no satisfactory answer, I think a few plain directions for brewing may be acceptable to your readers. There is no mystery whatever in the process, which is as simple as making tea, when properly understood. Common sense and common care is all that is requisite ; but a knowledge of the true principles will prevent errors which may arise in following the best receipt ignorantly. I shall endeavour to point out these principles, and then give the receipt I follow. The operation of brewing consists in obtaining the largest quantity of saccharine matter from malt ; in boiling that extract quickly with hops, and fermenting the decoction thoroughly, and allowing no opportunity for acid fermentation to take place. The largest quantity of saccharine matter is obtained by keeping the infusion of malt, for three or four hours, between the temperatures of 170° and 145° ; below or above these temperatures there is loss or risk, and at any rate little gain. The safest and most effective range at first is between 167° and 148° ; that is to say that the mash tun should never be raised above 167°, nor allowed to fall below 148° ; and the longer any given mash can be maintained between these temperatures the better. Below 148° you run risk of acidity ; above 170° of producing gum, not sugar. The course I adopt to attain this is as follows, for which purpose it is necessary to have a close fitting wooden cover to the mash tun, divided into two halves, and made like a copper lid. Having got my copper full of boiling water, I run into my mash tun 9 gallons for every bushel of malt I mean to wet, and immediately put on the covers. The copper is then filled again, and whilst it is heating, the water in the mash tun is slowly cooling. I endeavour that the copper shall reach 170° by the time the mash tun has fallen to 167°. At this latter temperature I mash, stirring the malt in thoroughly but quickly. The addition of the malt brings the mash tun down to 144° or 140°, according to the season and state of the malt. My copper meantime has reached 180° or 183°. I immediately add about 6 gallons more for every bushel of malt wetted, stirring it in carefully, which brings the mash up again to 165° or 167°. At this temperature I cover it close, putting sacks over the cover, and refill the copper. I allow the mash to stand till it has fallen to 148°, which it does in about three hours, more or less, according to the weather ; but be the time what it may, as soon as it reaches 148°, I let the wort run, and drain it pretty close. The copper, meantime, has been again gaining heat, and when the mash tun is pretty well drained—say in half an hour, I again run on 10 gallons more for every bushel wetted, at a temperature of 195°, or thereabouts. This again when stirred in raises the mash tun to 172° or 173°, which is now not dangerous. The instant this is done, having re-covered the mash tun, I pump the first wort into the copper, now empty, and make up the fire, and as soon as the wort begins to simmer, I add 1 lb. of hops for every bushel of malt, and boil for one hour and a quarter. At the end of this time, the second wort, which has been about 2½ hours on the malt is allowed to run, and the beer is at the same time run off into the coolers. As soon as the copper is empty, this second wort is pumped up and treated as the first, except that the hops are in it from the first, and it is boiled 2½ hours. It is very important not to allow the first wort to remain in the under back one minute longer than necessary, nor to expose it at all to air. When the second wort has been sufficiently boiled, it also is run into the coolers. The more rapidly it can be cooled the better, provided it be not messed about, or put into metal vessels. The first wort is set at about 61°, the second at 63° or 64°, with rather more than a pint of yeast to every bushel of malt wetted—say 2 quarts to a hogshead. In 24 hours it goes into the casks, the two worts being mixed equally together, and in about 72 hours more the active fermentation is over. I use no finings. The beer is always bright, and fit to drink in a month, but is better at the end of two, and gets brighter the longer it is kept. I brew with rain water, and next to that should prefer pond water if sweet. All utensils must be kept thoroughly clean, as clean and sweet as for milk ; and if there be any suspicion of acidity, they should be washed with lime-water two or three days before using. For any further details I refer to Black on Brewing, whose instructions I follow, though he does not clearly assign the reason for them, as I have endeavoured to do above. By the aid of that work I have learnt myself to brew, and have taught a labourer, so that he now, with certainty, brews some of the best beer in the neighbourhood ; and I have no hesitation in saying that everyone may have as good beer as they can wish to drink by following the foregoing receipt. Of course, the best materials accessible must be obtained, and the malt should never be kept more than a few hours after it is ground. The rapidity with which wort will become acid in certain states of weather is inconceivable. Of this, grains afford the strongest proof. I have known them become as acid as vinegar within one hour after they were taken out of the mash tun. Wort is equally susceptible ; and, once tainted, is incurable. Probably a great deal of beer is spoiled before it ever gets into the wort-copper. That is to say, acetous fermentation has begun in the wort, which interferes with the vinous fermentation, and goes on in the cask as soon as the imperfect vinous fermentation has ceased. For ascertaining the strength of wort a saccharometer is necessary ; but it is still more valuable for noting the progress of fermentation and detecting sluggishness or defect. It would be impossible in these columns to enter into further details. Those who desire them should procure the work above referred to, which contains much information on the whole subject ; but the rationale of a simple process is explained above. I believe it to be impossible to cure acid beer ; you may neutralise some of the acid by alkali, or you may disguise it by fresh wort ; that is to say, you may spoil good beer to make bad drinkable, but acetous fermentation once begun will go on, and neutralised or disguised acid is little less unwholesome than that which is patent. The only wise plan is to take care that your beer does not get acid ; and, if that misfortune does befall you, to throw it away, unless you make up your mind to drink it. *Barleycorn.*

Guano.—In reply to the wish of "Somerset" as to what quantity of guano, and how it was applied to the crop of Swedish Turnips, which exceeded 36 tons per acre (including tops), and for which the premium was awarded by the Worcestershire Agricultural Society last autumn, to my neighbour Mr. Oldaker—I beg to inform him that they were planted on the ridge, at about 30 inches apart, and that the guano was applied as a top dressing after the plants well covered the ground, immediately before each hoeing, and after rain or a heavy dew, the total quantity applied being about 3½ cwt. per acre. The plan which I have uniformly adopted is to sow the guano broadcast at the rate of about 2 cwt. per acre, and lightly harrow it in the land immediately it is ready to form the ridges, and plant the seed, by which means the manure is well distributed throughout the soil in the ridge, and not only stimulates the plant in the early stages of its growth, but gradually dissolving in the soil assists it through the latter. I also apply, by the hand, about 1 cwt. per acre, very finely powdered, as a top dressing, when the plants are fairly above ground, and when the soil is damp or during a heavy dew ; this promotes a rapid growth, and places them quickly beyond the ravages of the fly. *J. Webb, Colaines, near Worcester, March* 13.——My method has always been to apply about 3 cwt. or 3½ cwt. to the acre when the plants well cover the ground, and to hoe the ground as soon after as possible—and I do not like applying the guano unless there has been rain or a heavy dew. I have tried all distances, but am inclined to think that from 25 to 30 inches is the best distance for heavy crops. *Thomas Oldaker.*

Irish Linen.—The following extract, written about the year 1775, cannot fail to be highly interesting at this time. "It is of great importance to Ireland, that Flax, the basis of this manufacture, is of home growth, and of the most excellent quality. From the very moment of the seed being put into the ground, to the time of its being exhibited in the market, in the form of a piece of white linen, everything is the native growth of the soil, everything the productive labour of the inhabitant." The exports of linen from Belfast in 1775, were 147,278 pieces; one firm is now turning out more than that number of pieces annually; and we pay to the foreigner for Flax, Flax-seed, and oil-cake, upwards of six millions sterling per annum. From the constabulary returns of the breadth of Flax sown in Ireland in 1848, the total is given of 53,863 acres. The entire quantity of Flax required for British manufacture, would occupy from 350,000 to 400,000 acres. *T. S.*

Mr. Mechi's Live Stock Account for 1849.—As Mr. Mechi is a good accountant, I think he would confer a benefit on your readers, if he would analyse a little more of his account given in the *Agricultural Gazette* of March 2d, by giving the cost of bought food consumed by the bullocks, sheep, and pigs separately. I think if I divine rightly, that it will then be seen that pigs paid a fair profit; but sheep and bullocks, besides giving no return for any part of the green crops of the farm, did not even pay for their bought food. By his own showing there is from 300*l.* to 400*l.* to be met by his corn crops, which are I believe about 100 acres in Wheat *i. e.*, each acre in Wheat ought to produce from 3*l.* to 4*l.* more than in good common farming. As his purchase of corn is so great, this clearly is no question of free trade or protection, but a plain question as to a system of farming. Can it be profitable? *Alexander Hall Hall, Watergate, Petersfield, March* 9.

Pheasants and Domestic Fowls.—Your correspondent "J. B. B." doubts whether the pheasant ever breeds with the domestic fowl. I send you for his information the following. I live in a very retired situation; the nearest place at which fowls are kept, is a mile and a half from me. The fowls I used to keep were the silver Hamburgh, or Bolton Grey breed, but disliking them they were all killed off except a couple of hens, and I then kept fowls of the black Poland breed. I had no game fowl on my place or near me. Last summer one of my men told me he had seen one of the hens, a cross between the Poland and Hamburgh, repeatedly keping company in the woods with a cock pheasant. Others of the men saw this hen constantly with the cock pheasant. A short time after they saw her with a large batch of young chickens, I saw her and her chicks, but being very wild, she did not come down to the house until winter, when she brought down 5 cocks and 10 hens. The cocks exactly like game cocks, except that two of them had from 50 to 100 very beautiful spots on their necks, which since they moulted have disappeared; the hens are all much alike, dark brown bodies with yellow necks. I gave a cock and hen away, they were turned out by themselves, and I was told that the hen laid a very great number of eggs last year. For those I kept, I built a pen, and they have not laid well in it, probably from the confinement, but we have plenty of eggs ready to be set, and shall set them as soon as any hens are ready to set. I believe these to be a cross between the pheasant and the fowl. They are in my opinion very handsome birds. *A. K.*

Durable Paint for Iron Railing.—This subject having several times appeared in your columns, I am disposed to recommend the iron paint of the patent alkali company, as standing better than any other I have tried; not only the weather, but even considerable degrees of heat and corrosive matters; as it is used for lining the iron flues of my laboratory. It does not blister, nor crack and moulder in the sun, like white-lead; is considerably cheaper, goes further, more effectually protects the iron from rusting, and does equally well on wood, as gates, doors, &c. The colour is against it, being a deep purple red, but there is also a black made by the same company, which can be mixed with the red to deaden the colour. Of the black, I have no experience, but from the published specification (the red ignited with coal tar), see no doubt of its being equally durable with the red; and shall mix them the next occasion. It stands very well too mixed with half its weight of white-lead, to pale the colour while deadening the red. It does not seem yet to have found its way much into the country, but the London Office, is (or was), 20, Fenchurch-street. *J. Prideaux.*

A Garden Farm.—I am a country curate of very small means. In the autumn of last year I entered on my present curacy, and found a garden of full half an acre, which for a course of years has been allowed to grow wild. I am at a loss how to make the most of it—to make it remunerative; and it will be an act of charity in any of your correspondents to inform me. My family does not exceed three, and we do not require the luxuries of the table, vegetable or other. I am very remote from markets, and the poorest of my parishioners has a garden, and an allotment besides, if he chooses; so that I have no way of disposing of the produce of a garden—to sell, or give away to advantage. I have the use of the churchyard, about a quarter of an acre. I would add that the soil is light, *i. e.* of a sandy nature, and said to be rich. There is much fine pasturage all around me. As yet I have done nothing beyond ridging up, in November, the whole garden, having all the fruit trees pruned by an experienced hand, and collecting leaves for compost, cutting the old hedges into some form, and planting new. I would ask—what stock I should keep to consume the produce of my garden profitably. The best crops to attempt to raise for this purpose; and when to buy in. It has occurred to me that half an acre, well cultivated, simply with a view to profit, might serve as a good model for my parishioners who have allotments. I have not the means to exceed their outlay. I shall work myself, and my intention is to have a poor man's garden. Can you recommend to me any works likely to inform one who has no practical knowledge? I have the "Cottager's Calendar," by Joseph Paxton [It is the best for your purpose]. Is there any crop that can be raised profitably in a garden for poultry, where there are means to keep them outside of it. Cobbett, in his "Cottage Economy," speaks of fatting geese on boiled or raw Swedish Turnips, or Carrots, or white Cabbage, or Lettuce, with some Oats. He likewise speaks of Buckwheat for ducks. I shall look very anxiously for some answer to this communication. I scarcely need add that, to be useful, it must be full and prompt. *A Country Curate.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

PROFESSOR WAY, the Consulting Chemist to the Society, delivered a lecture, "On the Action of Soils upon the constituents of Manure," before the members of the Society, at their house, in Hanover-square, on Wednesday last, the 20th of March, Mr. RAYMOND BARKER, Vice-President, in the chair.

LECTURE ON SOILS AND MANURE.

Mr. WAY stated that he had on that occasion to bring before the Society some facts and observations in regard to the action of soils upon the constituents of manure. These observations he believed to be perfectly new to the agricultural public, and he hoped to show that they would throw much light on some of the operations of practical agriculture. As, however, he was preparing a paper for the next Journal of the Society, in which he would go minutely into the subjects and give the results of the investigations which had been proceeding for the last eight or nine months in his laboratory, he should that day merely give an outline of those results, avoiding everything in the shape of detail. It had often been observed that the dark liquid from a manure heap, if by chance placed upon a bed of soil through which it could filter, issued from the bottom almost or altogether deprived of colour. Again, the water of drainage, especially in heavy clay soils, was observed to be free from colour, and often beautifully clear and limpid. What was the nature of these actions? Were they the effect of mere mechanical filtration and the separation of the solid substances suspended in the water? Most persons would answer in the affirmative, and such had been the general impression hitherto, but it did not meet all the circumstances of the case.

On the table were glass filter-jars, containing a red soil from Mr. Pusey's estate in Berkshire. The soil, as the gentlemen present would see, occupied the jars to the depth of 5 or 6 inches. Upon one of these Mr. Way poured water obtained from one of the sewers of London. To another filtering jar he added a quantity of the fetid liquid produced in the steeping of Flax. Both of these liquids were turbid, highly coloured, and exceedingly offensive to the smell; but it would be seen that, so soon as having passed through the soil they began to drop from the jar, they were no longer the same. The resulting liquid had an earthy smell it was true—a smell always accompanying soils—but was no longer offensive to the nose. Now to what ingredient of the soil was this metamorphosis due? Was it due to the sand acting as a filter? It was easily proved that such was not the cause, and that there might be no doubt on this subject, Mr. Way would pass through a filtering-jar containing more than 9 inches depth of fine white sand, a quantity of cow's urine taken from a tank in the country. The liquid was so far altered by the filtration that the turbidity was removed, as it would be by filtration through paper, but the colour and disgusting smell remained in all their intensity. Sand, therefore, obviously was not the active ingredient in soils in respect to the power under discussion. The same must be said of the different forms of gravel, which were only coarse sand. The other great ingredient of soils was clay, and to this Mr. Way attributed the power in question. As an experiment comparative with the last, he would pass the same tank water through sand, mixed with one-fourth of its weight of white clay in powder, and they would observe the result was very striking. The liquid coming through was clear, and free from smell; indeed, it was hardly to be distinguished by its external characteristics from ordinary water. There could be no doubt, then, that the property of soils to remove colouring matters, and organic matters yielding smell from solution, was due to the clay contained in them. Filtration was only a method of exposing the liquid in the most perfect form to the action of the clay, but it was not necessary to the success of the process. In proof of which Mr. Way stirred up a quantity of soil with putrid human urine, the smell of which was entirely destroyed by the admixture, and upon the subsidence of the earth the liquid was left clear and colourless. It appeared, therefore, that the clay of soils had the property of separating certain animal and vegetable ingredients from solution, but was this property the only one exhibited? Mr. Way had found that soils had the power of stopping also the alkalies, ammonia, potash, soda, magnesia, &c. If a quantity of ammonia, highly pungent to the smell, was thrown upon a filter of soil, or clay made permeable by sand, the water first coming away was absolutely free from ammonia. Such was the case also with the caustic or carbonated alkalies, potash, or soda. This was a very wonderful property of soils, and appeared to him as an express provision of Nature. A power, he remarked, is here found to reside in soils, by virtue of which not only is rain unable to wash out of them those soluble ingredients forming a necessary condition of vegetation, but even those compounds, when introduced artificially by manure, are laid hold of and fixed in the soil, to the absolute preclusion of any loss either by rain or evaporation.

But Mr. Way had found that this property of clay did not apply only to the alkalies and their carbonates, but to all the salts of these bases, with whatever acid they were combined. Here again was a beautiful provision; sulphate of ammonia, when filtered through a soil, left its ammonia behind, but the sulphuric acid was found in the filtered liquid—not, however, in the free state, but combined with lime; thus sulphate of lime was produced, and brought away in the water. In the same way muriate of ammonia left its ammonia with the soil, its acid coming through in combination with lime, as muriate of that base. The same was true of all the salts of the different alkalies, so far as he had yet tried them. Thus lime in the economy of nature was destined to one other great office besides those which had already been found for it—it was the means by which the salts ministering to vegetation became localised and distributed through the soil and retained there until they were required for vegetation. Mr. Way pointed out that, from what he had just shown, it must be obvious that there was no provision for the ordinary salts of lime themselves. It was necessary that when the alkali of a salt is laid hold of by a soil, some provision should exist for the neutralisation of the acid with which it was combined; for all other salts lime performed this useful office, but it had nothing to fall back upon for its own salts. Sulphate, muriate, or nitrate of lime, when passed through a soil, would come through unchanged. This, however, did not extend to lime itself, or to its carbonate, when dissolved in carbonic acid, as it is found in most waters. Quicklime, when dissolved in water, is removed by passing the water through clay or through most soils containing clay; and carbonate of lime in solution is so effectually removed that hard water may be softened by the same process.

With regard to the extent to which these actions were capable of being carried. It was not to be supposed that we could go on filtering indefinitely with the separation of the salts contained in the liquid. On the contrary, the limit was soon reached; but although small in per centage quantity, the power was in reference to the bulk of the soil enormously great. He had found that a pure clay would absorb, perhaps, two-tenths per cent. of its weight of ammonia—that is to say 1000 grains would separate 2 grains of ammonia; and from reasons which need not then be noticed, a loam or a well cultivated clay soil would absorb nearly twice as much. Now every inch in depth of soil over an acre of ground weighed about 100 tons. Consequently 10 inches of depth of such soil would weigh 1000 tons, and would be adequate to combine with and retain 2 tons of ammonia, a quantity which would be furnished by about 12 tons of guano. Now one-sixtieth of this power would suffice for the preservation of the ammonia of an outside dose of guano, consequently he was justified in saying that the property was practically of immense activity. Mr. Way stated that he had ascertained the extent of the power in different soils and for the different alkalies. The property was decidedly a chemical one; and although he intended only to state the facts, without entering upon their explanation, he might say that he had every reason to believe that he should be able to develope that satisfactorily at the proper time.

Having thus endeavoured to call their attention to this highly interesting subject, the lecturer went on to point out very shortly the different operations of practical agriculture, upon which it was likely to throw light.

First, as to Manuring: Obviously if there was a provision in the soil for the retention of the salts of manure, and for the ammonia and other products of the decomposition of animal and vegetable matter, the soil was the proper place for those decompositions to go on, and no matter how remote the period when the crop would be taken, it would be perfectly safe to get the manure into the land as soon as practicable after its production. Again, the equable distribution was a point also which seemed of considerable importance; for, if it was an absolute necessity that a new class of compounds was found in the soil immediately the manure reached it, it seemed to follow that those compounds furnished the elements of nutrition to plants; consequently we should seek to produce them by every means in our power. Liquid manuring, wherever practicable, was an effectual way of securing this distribution. In the case of artificial manures, that is to say, manures composed of chemical salts, much simplicity was introduced by the new discovery. Henceforth we must regard the different salts (those of ammonia, for instance) as of value in relation to the price of the ammonia, or other base contained in them, since they are all alike when incorporated with the soil.

In liquid manuring it had been usual to think that

the application must be made to Grass, or to land bearing some crop; but now that it was known that the land, not the plant, retains the manure, no theoretical difficulty could arise in the use of liquid manure for arable land.

In Irrigation the principle now illustrated must certainly be of great importance, if, as there is but little doubt, the chemical characters of the water are of consequence, and that the soil is the means by which the salts and organic matters are separated for vegetation; then it will be obvious that the water should be made to flow *through* rather than *over* the soil. This reasoning is consistent with the observation, that to produce the full effect irrigated land should be well drained.

The application of water to land, not at the time bearing a crop, would be clearly admissible under this view, and is indeed practised extensively in Germany and some parts of Italy. Mr. Way also pointed out that the proper depth for drainage must be materially influenced by this property of soils to absorb manure. Without asserting that this or that depth was the most advisable, he thought it would be admitted that the water of drainage should pass through a depth of soil regulated, amongst other circumstances, by its particular power of detaining the manures placed upon it.

To the question of the application of Sewer refuse from towns these experiments brought much light, as they clearly proved that the sewer water might be applied in an unintermittent way, provided that a due relation were maintained between the capacities of retention of the soil—the quantity of manure applied, and the amount of crop taken in a given period. The great obstacle to the use of sewer manure, based upon the belief that it must be applied to the plant in actual growth, or it would otherwise escape in the drains, is thus removed. Lastly, after adverting to the probability that the power of soils to remove carbonate of lime, and thus soften water, might be turned to account for the supply of towns with pure water, Mr. Way said that he had great hope that with the clue he now possessed some material progress might be made in the elucidation of the action of lime itself upon soils, which he had reason to believe was closely connected with the phenomena which he had that day had the pleasure of explaining.

On the motion of Mr. Fisher Hobbs, seconded by Mr. Paine, the best thanks of the Meeting were voted to Prof. Way, for his kindness in delivering another lecture before the Members, and for the newly discovered and important agencies of the soil, in reference to manure, which he had so ably explained to them on that occasion.

A very interesting discussion then ensued, on the manner in which particular well-known facts in the cultivation of land were elucidated by the results thus obtained by Prof. Way in his chemical investigations.—Colonel Challoner had frequently been at a loss to account for the action produced by clay, or other aluminous matter, on manures applied to a portion of his property on Bagshot-heath, where, as it was well known, the soil was light and sandy, and through which the manure, without such application, passed off and was lost: he now could understand the reason why, in the course of three years, such soil, from the circumstance of the manuring elements being arrested by the clay, became capable of bearing crops.—Prof. Way considered the presence of clay necessary to retain manure; not only that immediately applied by the farmer to the land, but that which was known to exist in the atmosphere in the form of soot and ammonia, and to be brought down into the soil by showers of rain. —Mr. Raymond Barker referred to the improvement of chalk lands improved by claying them. — Mr. Barclay had found some of the most fertile soils on chalk subsoils.—Prof. Way's specimen of the clay then employed in his experiments, was obtained from Dorsetshire; and the more permeable clay was, the more nutriment it would derive from the greater amount of impregnated liquid passing through it. Burning clay nearly destroyed the peculiar property to which he had alluded, of arresting manuring matter; but it had been found very advantageous to have a portion of the clay burnt, and to intermix the indurated fragments (or coarse brick-dust, as it might be considered), resulting from such burning, with the remaining raw clay of the land. — Captain Wentworth Buller, R.N., was much interested in the lecture they had just heard. The new agency to which Prof. Way alluded threw much light on the question of liming, which, to himself as well as to others, had been hitherto a most perplexing one. They all knew that light soils did no good until clay was put upon them, and then they bore excellent crops; that bad meadows were only relieved by draining, for the purpose of allowing the confined water to escape, and new supplies to be constantly filtered through the pores of their soil; and that old pasture-ground, when broken up, would go on from year to year, without manure, yielding crops equal to those derived from lands to which manure had been regularly applied; and these several effects he thought might be mainly ascribed to the ammonia which, under the new conditions of each case, was retained by the soil.—Sir John Johnstone conceived that under drainage was the first essential in water-meadows. He had himself several near Leominster, and for some time it was thought merely necessary to put the water on them for the purpose of producing the effects required. He found, however, that the result was very unsatisfactory, under such conditions; but now, since they had been underdrained, they had become very valuable. He then proceeded to make some remarks on the quality of water, and its mode of action on water-meadows. The effect had been ascribed to the warmth of the water, and to its impregnation with manuring elements. He had no doubt that both these causes were favourable to the production of the effects required. About 20 years ago, Dr. William Smith, the well-known geologist, had laid out catch-meadows for him in Yorkshire, on the sides of hills of moderate land of a dry sandy quality on the calcareous grit, where the soil was porous, and without clogging. It having been imagined that warmth was the only requisite in the water employed, irrespective of the chalk or calcareous matter held in solution, it was not considered what might be the effect of such mineral impregnation; it proved however that the water partook of the nature of the mineral formation, on which the catch-meadows were made, and although earlier crops were obtained than on land not irrigated, the effect of this water was to destroy all the finer Grasses, and to leave only the rougher and inferior herbage on the meadows. The irrigation of these meadows had accordingly been discontinued.—Mr. Barker made some observations on the common opinion of the mode in which plants derived their nutriment on water-meadows.—Dr. Calvert would furnish Professor Way with specimens of soil from two contiguous pieces of land of his own in Yorkshire, one of which bore the heaviest crops of any land for miles round, while the other yielded only the poorest herbage; although the soils in appearance were exactly similar. —Mr. Barker thought it essential to ascertain whether the manure was applied in equal quantities to these soils.—Professor Way cited a corroborative instance of the latent causes of fertility and sterility in soils of apparently the same character. Two soils were sent to him from Sussex, with a request that he would submit them to scientific examination, and report the difference between their qualities. He found them in appearance exactly alike, their mechanical characters being identical in every respect; and chemically analysed, they were found to contain similar proportions of clay, sand, chalk, and organic matter. He reported this result accordingly; when the gentleman who had sent the specimen to him informed him that one of the soils was one of the best in the county, yielding 5 quarters of Wheat; while the other was one of the worst, yielding only 2 quarters; on which Professor Way recommended him to try liming on the poorer soil.—Colonel Challoner enquired whether acidity in the land might not often exercise a great influence over the quality of the soil and crops; and whether chalk would not remove such acidity as readily as lime.—Professor Way replied that caustic lime had an effect that chalk had not.—Colonel Challoner observed that quick-lime, on exposure to the atmosphere, soon became converted into the carbonate of lime, or chalk; but he was not aware whether the same conversion would take place when lime was mixed with the soil.—Professor Way remarked that lime, when only imperfectly excluded from the atmosphere, retained its causticity for a great length of time; for instance, in the mortar of buildings erected 500 years ago, the lime was found to have remained in its simple state without having combined with the carbonic acid of the atmosphere.—Mr. Rigby Wason then made some observations on the bearing of these new principles on the question of deep or shallow drainage. He conceived that we ought to drain as shallow as we could do, so as to drain effectually, in order to keep the arrested manuring matter more nearly to the crop growing on the surface, and thus render the whole of it available for the purposes of vegetation.—Mr. Barker referred to Sir H. Davy's advice to cart out all the manure, and mix it with the soil, on the day it was made.—Mr. Fisher Hobbs had never heard a lecture on chemistry of more importance to the practical farmer than the one with which Prof. Way had just favoured them; nor one from which the practical farmer would eventually derive more essential advantage. By the agency pointed out to them, not only colour and smell were removed from manuring matter, but that all-important volatile substance ammonia was fixed and arrested in its passage through the soil, and retained in such combination until required as pabulum for the growing plant. He could not agree with Mr. Wason in reference to shallow draining, when it was known that a depth of 30 inches gave off thick and turbid drainage water, while a percolation 4 feet deep had the effect of entirely removing the manuring matter, and allowing the water to pass away clear and limpid. Mr. Hobbs then gave an interesting statement of the depth to which he had known roots, especially those of Wheat, would penetrate, for the purpose of deriving nourishment to the plant; and of the result of his own experience in applying lime to the clays of Essex, which were almost unprofitable until that application had been made. He conceived that irrigation had not its proper effect, unless the lands to which it was applied were underdrained; and alluded to Mr. Parkes's recommendation of sub-irrigation, or the carrying of water by sluices to the roots of the plant, and allowing it to remain below the surface a sufficient time to enable the "mother earth" to abstract the warmth and nourishment required for the plants. He hoped, now, that chemistry, by its immediate application to practical purposes, would become an important aid to agricultural improvement.—Mr. Wason, in justification of the opinion he had offered respecting shallow draining, would remark, that the better the soil the shorter the root, for it would not be required to proceed far in search of its food; and the worse the soil, the longer the root, which, in this case, would exhaust the plant of its energies by creating the means for its radical extension, for the purpose of acquiring nutriment from the barren soil.—Mr. Paine stated the result of his experience on the application of clay to sandy land; and the abiding effects of high manuring. For several years he had known 50 or 60 tons of gault clay per acre applied to sandy soils, of which the effect was evident 25 years after the application, and was not due, as we found from Prof. Way's lecture that day, to the merely mechanical action of the soil, but to its chemical agency in arresting ammonia. Hops, it was well known, required rich manuring, and a piece of Hop-ground having been grubbed up, and the ground cultivated for farming purposes, the exact line of demarcation between the manured and unmanured portions of the farm was most striking. In fact, Mr. Paine observed, manure was never lost, for the soil was a magazine for its safe retention.—Prof. Way remarked that the power of clay to retain ammonia was astonishing. He had a piece of plastic pottery clay given him by Mr. Paine, dug up in its hard dry state, from a depth of 25 feet below the surface, in the very centre of which, when broken up, he detected a very sensible quantity, namely one-tenth per cent., of that volatile alkali, obtained by the clay from some animal source at a very remote period in the geological history of the world.—Mr. John Bethell enquired of Prof. Way, whether, as an arable field, from the principles deduced from his researches, and laid down in the lecture just delivered, might be regarded as a reservoir for manuring matter, he thought that clay fallows in summer might be frequently watered with ammonical liquids without injury to the subsequent crop.—Prof. Way considered that they might be so watered, provided sufficient time was allowed for the ammonia to become combined with decomposing salt contained in the clay, and thus have its caustic action prevented. — Mr. Bethell further inquired, whether Prof. Way would advise liming previously to the application of ammonia?—Prof. Way would, in all cases, recommend the use of lime first, and then the application of manures; the lime and manures not to be mixed together, but to be applied separately. — Mr. Bethell remarked that, as arable fallows, after being ploughed up, were frequently left in a plastic state, it would perhaps become a question, whether scarifying them several times during the year would not render them better filters for the liquid manure applied to them; and if so, what Prof. Way would consider the proper depth for such filtration.—Prof. Way felt a difficulty in answering any inquiry that would lead him to give an opinion on the contested question of deep and shallow draining.—Mr. Bethell was aware that guano was applied to the growing crop in damp weather; but he thought it would be well to mix guano up with the soil.—Mr. Brandreth Gibbs thought much would depend upon the point, whether the application was made to the immediate crop, or otherwise.—Prof. Way considered that it might be applied in any weather, provided it were well mixed with the soil.—Colonel Challoner applied tank-water to his fallows. He had that morning directed that two carts should convey the contents of three tanks on his Turnip land; and that the liquid should be turned in with the soil. He had found manure water applied to Grass land in dry weather burn up the Grass, while the same application after a shower always did much good.—Mr. Barclay stated his experience to the same effect; but having named the circumstance to Col. Le Couteur, that distinguished cultivator had informed him, that in Jersey he had carried liquid manuring to a great extent; but he had made it a rule never to apply it in dry weather.—Mr. Fisher Hobbs had been constantly told by the late Lord Western that he would not succeed with liquid manure; but he had nevertheless persevered, and had been successful. He inquired of Prof. Way, whether, in the case of gravels and sands, where there was no clay conveniently at hand, charcoal or charred peat would not retain the ammonia, and might be employed as a substitute. He had largely, and with great effect, employed the fish-salt of pilchard curers, as a manure. He had found, that when guano was sown in the field, and this fish-salt sown over it, that the salt had the property of depriving the guano of nearly the whole of its smell; and as the salt in question contained 10 per cent. of oil, he thought it probable that this oil might have the power of fixing the volatile alkali.—Prof. Way replied, that charcoal or charred peat had certainly the power of absorbing a considerable quantity of ammonia, and would no doubt have a similar effect to that of clay in retaining that substance, although its mode of action would be quite different. He also thought it very possible that an empyreumatic oil like that to which Mr. Fisher Hobbs had alluded, would have a strong tendency to remove the causticity of the ammonia, by forming a saponaceous compound with it.

Mr. Raymond Barker then left the chair, and the meeting broke up, with the understanding that the next weekly Council (at which all members have the privilege of being present), would be held on the following Wednesday, the 27th inst., at 12 o'clock.

Calendar of Operations.

Sussex Farm, *March* 18.—Our horses are engaged in sowing Oats and Tares, ploughing for and sowing Barley, also ploughing for the Mangold Wurzel crop, sowing seeds amongst the Wheat, Oats, and Barley, and harrowing and rolling the same.

We have sown part of Carrots, and planted between 4 and 5 acres of Potatoes; and as the Potatoes are sound and good, when late, we shall plant more. Early-ploughed ground works beautifully. Men are engaged in threshing Wheat and Oats, planting Potatoes, filling dung and carting Turnips, dressing Hops, preparing Hop-poles for the gardens, draining, &c. The men are turning Mangold Wurzel and Turnip heaps, picking stones off the young Clover, and Couch off the land intended for Turnips and Mangold Wurzel. Our ewes have now commenced to lamb, and as far as yet the lambs are strong and healthy. *J. B.*

Notices to Correspondents.

Bone-dust: *O P.* We should prefer guano for Lucerne.

Canary-seed: *Subscriber.* Sow 10 lbs. per acre in rows a foot apart, on a clay loam, in October, and treat the growing crop exactly as you treat Wheat.

Cheeses: *N P T.* What is the best way of packing cheeses to be sent to the West Indies?

Gypsum: *Anon.* Of the common sulphuric acid, sold at 1*d.* per lb., it would take about 130 lbs. to saturate 100 lbs. of dry chalk. It can never be your interest to *manufacture* gypsum; unless, indeed, it should be in the case of a chalk soil, which it is barely possible might, under certain circumstances, pay for a watering of dilute sulphuric acid.

Heifers: *A B.* If the meadow is good feeding ground, you may turn in the cattle early in May, and they may receive the bull.

Italian Rye-grass: *E D.* You may sow 6 or 7 pecks of seed over your Wheat some day soon when the ground is damp; hoe or harrow it in, and if next winter be mild, you will have some very useful "keep" in April next year. Your Drumhead Cabbage plants are forward enough to have a ripe crop in November next.

Oats: *Scotus.* If your climate is moderately early, sow one-third of your Oat break either with Late Angus or Blainsley Oats; one-third with Black Tartarian, and the remainder with Sandy Oats; but if late, sow one-half with Sandy and the other with Tartarian. The supposition that the last-mentioned sort yields a bitter flavoured meal, you will find on trial to be a mistake—the meal is of very superior quality, but does not look so fair as that made from the white-skinned Oats, in consequence of small portions of husk being ground down amongst it. The straw, however, makes but indifferent fodder, while that of the other varieties mentioned is excellent for this purpose. *H.*

Pond Mud: *Ruris Amator.* If our correspondent will send his real name and address to George Singer, Bockhampton, Dorchester, he may hear of something to his advantage, as George Singer's master cleaned out a pond of 9 acres about five years ago, and will have much pleasure in giving to "Pond Mud" any information he may wish.

Rooted Weeds: *J F S.* You must persevere in hand pulling—that *must* ultimately succeed. About fencing next week.

Rural Chemistry, by R. Solly, price 4*s.* 6*d.*, second edition, revised and enlarged, may be had of all booksellers, and at the Office of this Paper.

Wheat: *T D.* It is a specimen of Triticum turgidum, one of the bearded cone Wheats.

Winter Beans: *W J C.* Five pecks per acre, in rows 2 feet apart, would have been ample seeding. You had better hoe out a large number of the plants.

Markets.

COVENT GARDEN, March 23.

Notwithstanding the continued coldness of the weather, Vegetables are plentifully supplied, but many kinds of Fruit are still scarce. A few new hothouse Grapes have made their appearance. Pine-apples, though far from being plentiful, are nevertheless sufficient for the demand. Walnuts and Chestnuts are abundant; and Oranges and Lemons sufficient for the demand. Amongst Vegetables, Turnips and Carrots are good, and there is some fine Cornwall Broccoli in the market. Potatoes are unaltered since our last account. Lettuces and other salading are sufficient for the demand, and so are Mushrooms. French Beans, Asparagus, Seakale, and Rhubarb may be obtained at about last week's prices. Cut Flowers consist of Heaths, Pelargoniums, Bignonia venusta, Primulas, Camellias, Cinerarias, Azaleas, Lily of the Valley, Epacrises, Acacias, Lilacs, and Roses.

FRUITS.

Pine-apples, per lb., 6s to 10s	Almonds, per peck, 6s

POTATOES.—Southwark, March 18.

The Committee report that the arrivals during the last week were, with the old stock, much above the wants of the trade, which have been very small, and a reduction has again been submitted to with nearly every description of Potato. Stale Yorkshire Regents are scarcely saleable at any price. The following are this day's quotations:—York Regents, 70s. to 100s. per ton; Wisbeach do., 60s. to 70s.; Scotch do., 60s. to 65s.; Scotch cups, 50s. to 65s.; Scotch common whites, 40s. to 45s.; French whites, 50s. to 65s.; Belgian do., 50s. to 55s.; Rhenish do., 50s. to 55s.; Dutch, 40s. to 45s.

HOPS.—Friday, March 22.

Messrs. Pattenden and Smith report that prices and demand continue about the same as for some time past.

HAY.—Per Load of 36 Trusses.

Smithfield, March 21.

Prime Meadow Hay	65s to 75s		Clover	60s to 80s	
Inferior ditto... ...	55	63	New Clover	—	—
Rowen	50	60	Straw	23	28
New Hay	—	—		J. Cooper.	

The supply short, but sufficient for the demand.

Whitechapel, March 21.

Inferior ditto ...	50	55	Inferior ditto... ...	55	60
New Hay	—	—	Straw	24	28
Old Clover	80	84			

SMITHFIELD, Monday, March 18.

Our supply of Beasts is about the same as on Monday last. The demand is very small; however, owing to favourable weather, the trade is cheerful for the best descriptions, and prices are more firmly maintained. Trade is exceedingly dull for Sheep, although the numbers have not much increased. Our highest quotations are with difficulty reached. The supply of Calves is moderate; they are more freely disposed of at late rates. From Holland and Germany we have 559 Beasts, 640 Sheep, and 50 Calves; from Scotland, 300 Beasts; from Norfolk and Suffolk, 2000; and 300 from the midland counties.

Beasts, 3578; Sheep and Lambs, 19,840; Calves, 102; Pigs, 190.

Friday, March 22.

The supply of Beasts to-day is good, and the demand still small for choice Scots; 3s. 8d. is an extreme quotation, although they make over 3s. 6d. Trade is very dull for other kinds at late rates. The number of Sheep is only moderate; it is, however, difficult to effect a demand at Monday's prices. There is more demand for Lamb, Easter being near, and the supply scanty. Some choice ones have made rather over 6s. Calves are not plentiful for the time of year; trade is brisk, but it is exceedingly difficult to advance prices. From Holland and Germany there are 65 Beasts, 160 Sheep, and 127 Calves; from France, 150 Sheep; from Scotland, 300 Beasts; and 125 Milch Cows from the home counties.

		Calves 3 4	— 4 4
		Pigs 3 0	— 4 0

Beasts, 889; Sheep and Lambs, 3370; Calves, 231; Pigs, 195.

MARK LANE.

Monday, March 18.—The supply of Wheat from Essex, Kent, and Suffolk, by land carriage samples to this morning's market was small, and disposed of at the prices of this day se'nnight. The attendance was rather larger than of late, and there appeared a somewhat increased disposition to purchase foreign Wheat; nevertheless, the business transacted was quite in retail, and without improvement in price.—Barley and Peas are unaltered in value, but a slow sale; new Beans (Tick and Mazagan), must be written 1s. per qr. cheaper.—There is a fair trade for Oats, at late rates.

Friday, March 22.—The quantities of corn arrived this week are small, but we believe there is a large number of vessels in the river. Business continues very inanimate in all articles, and sales of foreign Wheat are difficult to effect, even at the above reduction.—Barley, Beans, and Peas are unaltered in value.—The Oat market is very heavy, and the turn cheaper.—The value of Flour is unaltered.—Galatz Maize has been sold at 27s. per qr. afloat.—By accounts just received from the Baltic, great apprehensions are entertained of the Rye and Wheat plants having suffered severely from frost, and the rivers are again covered with ice. Throughout the provincial markets of the kingdom fully former prices have been realised for Wheat during the week, and the turn of the trade has perhaps been slightly more favourable. Spring corn of all kinds continues depressed.

Liverpool, Tuesday, March 19.—The supplies of grain and Flour during the past week are on a moderate scale, but the demand has been quite limited, and scarcely any change has occurred in the price of any article. Wheat was without any change in price, and Barley, Beans, and Peas were in slow demand. Indian Corn was 6d. per qr. dearer, with more doing in it than last week.

Galvanised Wire Game Netting.—

7d. per yard, 2 feet wide.

	Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide ...	7*d.* per yd.	5*d.* per yd.
2-inch .. strong ,, ...	9 ,,	6½ ,,
2-inch ,, extra strong ,, ...	12 ,,	9 ,,
1½-inch ,, light ,, ...	8 ,,	6 ,,
1½-inch ,, strong ,, ...	10 ,,	8 ,,
1½-inch ,, extra strong ,, ...	14 ,,	11 ,,

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

Strong Premium Hare and Rabbit Proof Wire Netting.

Charles D. Young and Company (late W. and C. Young),

Manufacturers of Iron and Wire Work, &c., 22, Parliament-street, Westminster, London; Castle-Buildings, Derby-square, Liverpool; 128, High-street, Edinburgh; and 32, St. Enoch-square, Glasgow, beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

Prices.—18 ins. high, 9*d.*; 24 ins., 1*s.*; 30 ins., 1*s.* 3*d.*; and 36 ins., 1*s.* 6*d.* per lineal yard.

Or a web of 100 yards, 18 ins. wide, will cost ..	£3 15 0
Do. of 100 yards, 24 ins. wide	5 0 0
Do. of 100 yards, 30 ins. wide	6 5 0
Do. of 100 yards, 36 ins. wide	7 10 0

If more or less than a web is required, it would be charged at the same rate per yard.

This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. Young and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1*s.* is equal to 2½ yards of another article in the market, the same width, at 9*d.* per yard. Samples for inspection sent free of expense.

C. D. Young & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland.

Iron and Wire Fencing, and Metallic Bedsteads.

Thomas Perry and Sons,

252, Oxford-street (near Hyde Park), And Highfields Foundry and Wrought-iron Works, Bilston, Staffordshire, Manufacturers of all descriptions of PLAIN AND ORNAMENTAL IRON AND WIRE FENCING, Park Entrance, Carriage and Field Gates, Wickets, &c.; Deer, Sheep, and other Hurdles; Hare and Rabbit-proof Wire Fencing; Iron Bedstead Makers to the Board of Ordnance; And Government Contractors.

The works of Messrs. Perry being situated in the heart of the first iron district, they are enabled to execute all orders with the greatest facility; and on the most moderate terms. Drawings made and estimates prepared, if required. The show rooms contain an immense variety of every description of Iron and Wire-work, and are the largest in London. An Illustrated Catalogue of Bedsteads, with dimensions and prices, sent on application, post-free.

Bee Hives.

George Neighbour and Son respectfully announce that they have prepared for this season an extensive supply of their various IMPROVED BEE HIVES, which are offered to all who are desirous of cultivating that pleasing and profitable branch of rural economy—the Honey Bee. The collection consists of "Nutt's Collateral Hives," "The Single Box Hive," "The Amateur Bar Hive," "The Improved Cottage Hive," &c., from either of which the honey may be taken at any time without injury to the Bees, and may be worked with safety, humanity, and profit, by the most timid and unaccustomed to Bee manipulation. A descriptive paper, with drawings and prices, will be forwarded on the receipt of two postage stamps.—George Neighbour and Son, 127, High Holborn, London.

"Nutt on Bees" (6th edition), now published.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew-lane, on WEDNESDAY, March 27th, and THURSDAY, 28th, at 12 o'clock, a first-rate collection of Carnations, Picotees, and Auriculas. Among the Carnations will be found Defiance, Strong's Duke of York, Solander, Flora's Garland, Cartwright's Rainbow, &c. The Picotees comprise Jenny Lind, Willmer's Princess Royal, Superlative, &c. Together with Standard and Dwarf Roses, Dahlias, Gooseberries, &c.—On view the morning of sale. Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

CAMELLIAS, STANDARD ROSES, AND CRYPTOMERIA JAPONICA, WITH SOME STOVE AND GREENHOUSE PLANTS FROM A GENTLEMAN'S COLLECTION.

MR. J. C. STEVENS is directed to sell by Auction, at his Great Room, 38, King-street, Covent Garden, on WEDNESDAY, March 27, at 12 for 1 o'clock, a collection of 250 Camellias, from 1 to 6 feet, 300 Standard Roses of the finest sorts of Hybrid Perpetual and Bourbon, 200 fine seedling Cryptomeria Japonica from 1 to 3 feet, and a small collection of Stove and Greenhouse Plants.—May be viewed on the morning of Sale, and Catalogues had of Mr. J. C. STEVENS, 38, King-street, Covent Garden, London.

BUSHEY GROVE, NEAR WATFORD.
IMPORTANT SALE OF SHORT-HORNS.

MR. H. STRAFFORD has the honour to announce that he has received instructions from Stewart Marjoribanks, Esq., of Bushey-grove, near Watford, to sell by Auction, without reserve, on WEDNESDAY, May 1, 1850, his entire Herd of very superior and well bred SHORT-HORNED CATTLE, consisting of about 60 Bulls, Cows, and Heifers, descended from the celebrated stocks of the late Earl Spencer, Earl Carlisle, Lord Feversham, the Right Hon. W. G. Hayter, M.P., W. C. R. Stansfield, Esq., M.P., Harvey Combe, Esq., J. B. Stanhope, Esq., Messrs. Dudding, Jobson, Stokes, Sutton, &c.

Catalogues with the pedigrees are now printing, which will shortly be issued, and may be had on application to Mr. F. FERON, the Bailiff, at the Bushey Grove Farm, near Watford; and of Mr. STRAFFORD, 3, Camden Villas, Camden Town, London.

MR. HASLAM will sell by Auction, on WEDNESDAY, March 27, and THURSDAY, March 28, at the Auction Mart, a choice selection of Azalea indica, Roses, Carnations, Herbaceous Plants, Flowering Shrubs, Ranunculus, Flower-seeds, &c. Catalogues to be had at the Mart; and of the Auctioneer, South Essex Nurseries, Epping and Ongar, Essex.

AMERICAN PLANTS, EVERGREENS, STANDARD ROSES, RHUBARB, FRUIT TREES, SEED POTATOES, &c.

MR. D. A. RAMSAY has received instructions to sell by Auction, at the Brompton Auction Ground, Fulham-road, Brompton (1 mile from Hyde-park-corner), on THURSDAY, March 28, at 12 o'clock precisely (on account of the number of lots), without any reserve, 400 Rhododendrons, 2 to 4 feet; 100 scarlet do., with a quantity of Azalea and other American plants; 500 Aucuba, 2 to 4 feet, with 5000 Evergreens, Shrubs, and Ornamental Trees; 250 Irish Ivies from pots, 1000 Standard, Dwarf, and Pillar Roses, a quantity of Mulberry Trees, Dwarf Trained Fruit Trees, Grape Vines, 500 Victoria and Tobolsk Rhubarb, Ash-leaf Potato, and other Miscellaneous Stock.—May be viewed one day prior to the sale, and Catalogues had (free by post), of the Auctioneer, Brompton Nursery, Fulham-road, Brompton.

EXCELLENT NURSERY STOCK.

MR. T. BAXTER will sell by Auction, on THURSDAY, March 28, on the premises, Bromley, Kent, in consequence of the decease of the proprietor, the whole of the well rooted Plants, including Laurels, Hollies, Laurestinas, Arbor-Vitæs, Box, Yews, Cedars, Phillyreas, and other Shrubs; also a quantity of Forest and Fruit Trees.—May be viewed, and Catalogues had, at the "Castle," Deptford; and of the Auctioneer, Estate Agent, &c., Bromley, Kent.

TO NURSERYMEN AND OTHERS.—CHELMSFORD, ESSEX.

TO BE DISPOSED OF, with immediate possession, in consequence of the death of the Proprietor, an old established NURSERY and SEED BUSINESS, carried on by the late Proprietor and his Father for many years. In-coming Valuation very low.—For particulars apply to Mr. W. W. DUFFIELD, Solicitor, Chelmsford.

TO MARKET GARDENERS, FLORISTS, AND OTHERS.

TO BE LET, and entered upon immediately, about 7 acres of MARKET GARDEN GROUND, within 6 miles of London, and contiguous to Water and Rail. The Land is rich and well stocked—a large portion furnished with productive Fruit Trees, and held at the low rent of 45*l.* per annum, for a term of 13 years, with Cottage, Greenhouse, Pits, Utensils, &c., to be obtained for 150*l.*—For address, apply, post free, to Mr. BARRETT, 2, Bell-yard, Doctors'-commons.

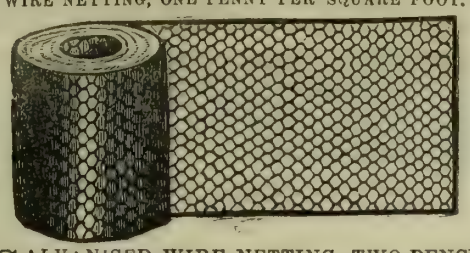
TO NURSERYMEN, FLORISTS, AND GREENGROCERS.

TO BE LET, a NEW HOUSE AND SHOP, with Plate Glass Front, large walled Gardens, &c., near Battersea-bridge and the new Park, surrounded by a rapidly improving neighbourhood. The house is arranged for letting the upper part (5 rooms), with private entrance. Well drained, and abundant spring water. Rent low.—Apply before 3 o'clock daily, to Mr. SMEEDON, 12, Sloane-square, Chelsea, London.

TO GARDENERS, SEEDSMEN, AND FLORISTS.

TO BE LET, with immediate Possession, an old established Concern in the principal and most fashionable thoroughfare in Brighton, the Western Road; comprising the Seed, Fruit, and Florist Business, with excellent Vinery, Show-house, and Stove. In-coming moderate.—Apply to Messrs. ROGERS and AYLING, Nurserymen, Withdean, near Brighton.

IMPROVED DRAINING TILE MACHINES.



B. SAMUELSON, successor to the Executors of the late JAMES GARDNER, Britannia Iron-works, Banbury, calls attention to his Improved DRAINING-TILE MACHINES, so proportioned that a child can work them, and having a check action to prevent breakages.—Sketch and particulars forwarded on application as above.

SCHOOL FOR GENERAL AND SCIENTIFIC EDUCATION (especially with regard to Agriculture), Wickham Market, Suffolk, under the immediate patronage of the Right Hon. Lord RENDLESHAM, M.P.; conducted by Mr. G. DOWNES. The Classical and Mathematical branches are entrusted to a Graduate of Cambridge; the Commercial and other departments to efficient Assistant-Masters. A Laboratory, collection of Philosophical Apparatus, Library, &c., are attached to the School.—Terms are moderate and inclusive, and may be known upon application to Mr. G. DOWNES, Wickham Market, Suffolk. A vacancy for an articled pupil.

CHEMICAL INSTRUCTION AND ANALYSIS.—Mr. CHARLES L. BLOXAM, Assistant to the Royal College of Chemistry, London, CONDUCTS AGRICULTURAL, Medical, and General ANALYSES, and gives private evening instruction in analytical and general chemistry, at his laboratory, 23, Duke-street, Grosvenor-square.

SUPERPHOSPHATE OF LIME, GUANO, CRUSHED BONES, and all other artificial MANURES, at Messrs. HUNTS' Bone Mills and Manure Works, High-street, Lambeth, London. Established 1816.

WIRE NETTING, ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

12	inches wide	3*d.*	per yard	30	inches wide	7½*d.*	per yard
18	"	4½*d.*	"	36	"	9*d.*	"
14	"	6*d.*	"	48	"	1*s.*	"

Galvanised do., 1*d.* per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards, Wire House Lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s.* each; Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

CRISP'S EASTER EXCURSION TO PARIS will leave London on WEDNESDAY EVENING, the 27th inst., arriving in Paris viâ Southampton, Hævre, and Rouen, the next afternoon, with the option of remaining at either of those delightful places for a day or more. FIRST CLASS to PARIS and BACK, including Passports and bed and breakfast at first-rate hotels for a week, 5*l.*; SECOND CLASS, ditto, 4*l.*—Tickets and full particulars at CRISP'S Excursion Office, 51, Bedford-street, Strand; and, for the convenience of city gentlemen, at HAMMOND'S Town and Country Advertisement Office, 27, Lombard-street, London.

LADIES AND GENTLEMEN'S DRESSING CASES. MECHI, 4, Leadenhall-street, London, invites an inspection of his STOCK, which possesses peculiar advantages both in quality and price. There is a general complaint that the internal fittings of dressing cases are often very inferior. Those who purchase at MECHI'S will be sure of having everything of the best, because he has long been celebrated for the superiority of his cutlery, and has bestowed equal pains in bringing to perfection his tooth, nail, hair, and shaving brushes, and other necessaries. In fact he considers it essential that each article in a dressing-case should be perfect in itself, so as to render the whole useful and complete. Those who desire to have particulars may obtain a catalogue gratis. The largest assortment in London of papier-mache manufactures, and the usual stock of articles suited for presents. MECHI'S peculiar steel razors 7*s.* and 10*s.* per pair. His magic strops 2*s.* 6*d.* to 6*s.* 6*d.*; paste 6*d.* and 1*s.* per cake. Cutlery ground and repaired daily on the premises.

REPEAL OF THE ADVERTISEMENT DUTY.—The London Committee respectfully request their friends to continue their efforts in this matter. The question will certainly be brought before the House of Commons at the earliest opportunity during the present session, by Wm. Ewart, Esq., M.P.

It is of importance that petitions for the abolition of the tax be forwarded to local members for presentation; at the same time a request should be made that its prayer may be supported by their votes. Petitions ready for signature may be obtained on application to this office.

By order. THOS. M'ENTEER, Hon. Sec.
16, Salisbury-street, Strand.

AUSTRALIA, NEW ZEALAND, CAPE OF GOOD HOPE, NATAL, &c.

PASSENGERS to the COLONIES generally may obtain their OUTFITS from S. W. SILVER and CO., CLOTHIERS, &c., 66 and 67, CORNHILL, at wholesale prices. SILVER and CO. make nearly the whole of the articles comprised in an outfit, to secure durability, so that the Cabin Folding Furniture may become permanent Household Furniture on arrival in the colony.

They also engage PASSAGES, and give ship sailing INFORMATION, but they neither receive nor pay a commission—their object being to give PASSENGERS who place themselves in their hands every benefit; and they forward small packages for their customers (gratis) through their AGENTS in the COLONIES.

SILVER and CO. give DRAFTS on AUSTRALIA at sixty days' sight of 103*l.* for every 100*l.* paid here.

The EMIGRANT Fitting-out Branch is at No. 4, Bishopsgate-street, opposite the London Tavern, where a comfortable fit-out for male or female, including bedding, may be obtained for FOUR POUNDS.

A Branch of each at ST. GEORGE'S-CRESCENT, LIVERPOOL.

"NORTON'S"

CAMOMILE PILLS are confidently recommended as a simple but certain Remedy, to all who suffer from Indigestion, Sick Head-Ache, Bilious and Liver Complaints, Heartburn, and Acidity of the Stomach, Depressed Spirits, Disturbed Sleep, Violent Palpitations, Spasms, General Debility, Costiveness, &c. They act as a powerful tonic and gentle aperient; are mild in their operation, safe under any circumstances, and thousands of persons can now bear testimony to the benefits to be derived from their use. Sold in bottles at 1*s.* 1½*d.*, 2*s.* 9*d.*, and 11*s.* each, in every town in the kingdom.

CAUTION.—Be sure to ask for "NORTON'S PILLS," and do not be persuaded to purchase an imitation.

ALLSOPP'S BURTON AND EAST INDIA PALE ALES.—Messrs. S. ALLSOPP and SONS beg to call the attention of the public to their East India, Pale, and other Burton Ales, which may be obtained in casks of 18 gallons and upwards, either singly or in any quantity, by application to the Brewery, Burton-on-Trent, or on the same terms at their respective Stores, as follows:—61, King William-street, London; Cook-street, Liverpool; under the Exchange, Ducie-place, Manchester; and at the Market-place, High-street, Birmingham.

METCALFE'S ALKALINE TOOTH-POWDER will be found to be the best that has yet been produced; it contains no acids, nor anything that can injure the finest enamel; it thoroughly removes the tartar and all impurities, produces that beautiful white appearance so much to be desired, and its fragrant perfume tends to sweeten and purify the breath. M. and Co., from the many years they have been celebrated as Tooth-Brush Makers, have had opportunities (that occur to few) of testing the relative merits of those powders that have been brought before the public. They have now succeeded in procuring the receipt from which the above Powder is prepared, and confidently recommend its universal adoption. Wholesale and retail at METCALFE, BINGLEY, and Co.'s, Brush-Makers to H.R.H. Prince Albert, 2*s.* per box. Caution.—The genuine Powder will have the Royal Arms, combined with those of H.R.H. Prince Albert, on the lid of the box, and the signature and address of the firm, thus: "METCALFE, BINGLEY, and Co., 130 B Oxford-street, London."

THE IMPERIAL COVERLETS, now so universally admired and appreciated, as a Cheap, Durable, LIGHT, Warm, and Elegant COVERING for the BED, can be had, Wholesale and Retail, of W. H. BATSON and Co., 1, Princess-street, Manchester; and 499, Oxford-street, London.

"I disapprove exceedingly of thick heavy Quilts and Counterpanes; they should always be avoided, especially by invalids, as they irritate delicate frames and prevent sleep."—*Dr. Graham's "Domestic Medicine,"* pages 192, 729.

DEAFNESS.—New Discovery.—THE ORGANIC VIBRATOR, an extraordinarily powerful, small, newly-invented instrument, for deafness, entirely different from all others, to surpass anything of the kind that has been, or probably ever can be, produced. It is modelled to the ear, so that it rests within, without projecting. Being of the same colour as the skin, it is not perceptible. Enables deaf persons to enjoy general conversation, to hear distinctly at church and at public assemblies. The unpleasant sensation of singing noises in the ears is entirely removed, and it affords all the assistance that possibly could be desired. Also, invaluable newly-invented SPECTACLES.—S. and B. SOLOMONS, Aurists and Opticians, 39, Albemarle-street, Piccadilly, London.

"Where cruder juices swell the leafy vein,
Stint the young germ, the tender blossom stain."

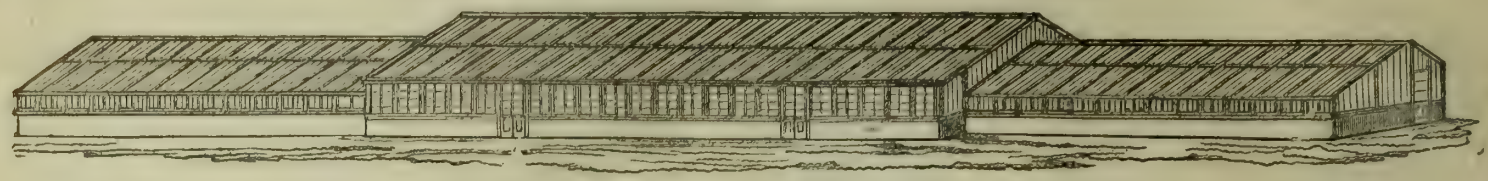
DR. SCOTT'S Aperient Tablets (of a delicious flavour) will be found a prompt, efficacious, and invigorating alterative aperient Medicine, correcting those crudities of the vital fluids which constitute the primary cause of every disease, and, by assisting Nature in all her requirements, speedily restores the patient to health. They are also the safest and best medicine for children. "A new Medicine, called Dr. Scott's Aperient Tablets, has, by its extraordinary virtues, taken the public by surprise. It is a mild, aromatic, tonic aperient, of a pleasant flavour; and to such as suffer from indigestion, impaired appetite, bilious or liver complaints, inactive bowels, nervous affections, impurities of the blood and secretions, gout, dropsy, worms, &c., we strongly recommend it. It is also a safe, pleasant, and efficacious medicine for children."—*Morning Chronicle*, Jan. 25. Sold in boxes, at 1*s.* 1½*d.* and 2*s.* 9*d.* Agents: RUDD and Co., 151, Strand (of whom they may be had for 15 postage stamps); and sold by all Dealers in Patent Medicines throughout the Kingdom.

TRY THAT FAMOUS REMEDY, PARR'S LIFE PILLS.—It is a fact beyond dispute, that most of the diseases with which the human race are afflicted are the result of a disordered state of the blood. To remedy this, the occasional use of PARR'S LIFE PILLS should be had recourse to, and sickness prevented as well as cured. In their operation they go direct to the disease. After you have taken six or twelve Pills you will experience their effect; the disease upon you will become less and less by every dose you take; and if you will persevere in regularly taking from three to four Pills every day, your disease will speedily be entirely removed from the system. None are genuine, unless the words "PARR'S LIFE PILLS" are in White Letters on a round ground, on the Government Stamp, pasted round each box; also the *fac simile* of the Signature of the Proprietors, "T. ROBERTS and Co., Crane-court, Fleet-street, London," on the Directions. Sold in boxes at 1*s.* 1½*d.*, 2*s.* 9*d.*, and family packets 11*s.* each. Sold by all Chemists. Also a certain and speedy cure for Influenza, Coughs, Colds, Asthma, Incipient Consumptions, and all disorders of the Chest and Lungs, SPENCER'S PULMONIC ELIXIR, carefully prepared from the recipe of the late C. Spencer, Surgeon, &c., Salford, Manchester; deservedly celebrated as the most successful practitioner in all Pulmonic Affections. Persons desirous of testing the efficacy of this medicine, must observe that on each bottle are the words "SPENCER'S PULMONIC ELIXIR," and that each wrapper has a *fac simile* of the Proprietor's Signature, "T. ROBERTS and Co."—Prepared only by T. ROBERTS and Co., Crane-court, Fleet-street, London; sold wholesale by EDWARDS, 67, St. Paul's Churchyard; BARCLAY and SONS, Farringdon-street; SUTTON and Co., Bow Churchyard, London; and all respectable Medicine Vendors in the Kingdom. In bottles at 1*s.* 1½*d.* and 2*s.* 9*d.* each.

*** The bottles at 2*s.* 9*d.* contain nearly three small.

BEAUTIFUL TEETH.

ROWLAND'S ODONTO, OR PEARL DENTIFRICE. A white Powder, compounded of the choicest and most *recherché* Ingredients of the Oriental Herbal, of inestimable value in preserving and beautifying the Teeth, strengthening the Gums, and in giving sweetness and perfume to the Breath. It extirpates all tartarous adhesions to the Teeth, and ensures a pearl-like whiteness to the enamelled surface. Its Anti-Septic and Anti-Scorbutic properties exercise a highly beneficial and salutary influence; they arrest the further progress of decay of the Teeth, induce a healthy action of the Gums, and cause them to assume the brightness and colour indicative of perfect soundness; while, by confirming their adhesion to the Teeth, they give unlimited enjoyment and fresh zest to appetite, by perpetuating effective and complete mastication. The Proprietors of this Dentifrice pledge themselves that its efficacy in preserving and embellishing the Teeth far surpasses anything of the kind ever yet offered to the public, and has, in consequence, obtained its selection by Her Majesty the Queen, the Court and Royal Family of Great Britain, and the Sovereigns and Nobility of Europe.—Price 2*s.* 9*d.* per box.



CAUTION.—To protect the public from fraud, the Hon. Commissioners have directed the Proprietors' Name and Address, thus—"A. ROWLAND and SON, 20, HATTON GARDEN," to be engraved on the Government Stamp, which is affixed on each box. Sold by the Proprietors and by Chemists and Perfumers.

HOLLOWAY'S PILLS, AN ADMIRABLE REMEDY FOR THE CURE OF LIVER COMPLAINTS AND BAD DIGESTION.—Mr. Wilson, a gentleman lately returned from Bengal, where he had been employed for several years in the Hon. E. I. Company's service, called at Professor Holloway's establishment a few days ago, to state the benefit he had derived from taking these unparalleled Pills, having suffered from a liver complaint for years, with a digestion so impaired, that for months he could not make use of any solid food. Other remedies seemed to have no effect on the disorder, but Holloway's Pills acted so wonderfully in cleansing the Liver, and strengthening the digestive organs, that he is now quite restored to health. Sold by all Druggists, and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

GRAY, ORMSON, AND BROWN,

DANVERS STREET, CHELSEA,

Respectfully solicit the attention of the Nobility and Gentry to their superior manner of Erecting and Heating every description of Building connected with Horticulture. They have much pleasure in giving the following testimonial referring to the range of houses shown below.

Peach House, 30 by 16 feet. | Vinery, 30 by 16 feet. | Stove, 45 by 20 ft. | Greenhouse, 45 by 20 ft. | Vinery, 30 by 16 ft. | Vinery, 30 by 16 ft.

[ERECTED FOR JOHN SHAW LEIGH, ESQ., LUTON HOO.]

Extract of a Letter from Mr. FRASER.—"I have much pleasure in expressing my entire satisfaction with the range of houses you erected here. I may also state that my honoured employer, JOHN SHAW LEIGH, Esq., is perfectly satisfied. I have no hesitation in stating, that to the best of my knowledge, there is not a more complete range of glass in the country, as regards both building and heating. I may add that they are admired by every Gardener who has seen them. I shall have much pleasure in answering any references you may please to direct.

(Signed.) "JAMES FRASER, Gardener, Luton Hoo Park."

A package of Summer Stocks, 12 vars., each at 100 corns, 1*s.* 6*d.*
" Ditto 18 " " 2*s.* 3*d.*
" Autumn Stocks 8 " " 1*s.* 3*d.*
" Ditto 12 " " 1*s.* 10*d.*
" Dwarf Asters 12 " " 1*s.* 6*d.*
" Pyramidal Asters 10 " " 1*s.* 6*d.*

Post stamps are accepted for payment

FLOWER SEEDS FREE BY POST. — One Hundred packets of the newest and best sorts for 18*s.*; Fifty for 10*s.*; Twenty-five for 6*s.* Selection can be made from RENDLE'S Descriptive Catalogue of Flower Seeds.

GERMAN SEEDS.—*We have a large stock of all the best varieties (See our Advertisement, page 177, March 23, "Gardeners' Chronicle"), including Stocks, Asters, Wallflowers, Balsams, Larkspurs, Hollyhocks, Zinnias, &c.*

For particulars apply to WILLIAM E. RENDLE and Co., Seed Merchants, Plymouth. Established 1786.

J. FOWLE AND SON beg to state that their annual CATALOGUE, containing a choice collection of Antirrhinums, Verbenas, Petunias, Fuchsias, Geraniums, Herbaceous, and other highly ornamental Plants, is now ready, and may be had upon post-free application to Holland Nursery, Holland-street, Brixton-road, Kennington, Surrey.

N. GAINES begs to inform the admirers of the Fancy GERANIUMS, he intends sending out on Monday next the following Seedlings: Gaines's Parodi, do. Lady Louisa Cornwallis, do. Elegans, do. Priam, do. Nina, do. Queen Superb, do. Signora Carolinii, do. Oderata variegata; also he has good strong plants of his Hero of Surrey and Cerise Unique. On the 1st of May will be ready for delivery, his superb new Seedling DAHLIAS Lady Auckland, Empress of Yellow, Lord Hardinge, Fancy do., Princess Louisa, Hero, Desdemona, Rotundiflora and Atalanta. Opinion of this Paper (1849), see August, No. 34; September, No. 38. Gardeners and Land Stewards' Journal, August, No. 32; September, No. 35.—A Descriptive Catalogue of the above, including Calceolarias, Dahlias, Pelargoniums, Fuchsias, Cinerarias, Chrysanthemums, Azaleas, Verbenas, Rhododeadrons, &c., may be had by applying at the Nursery, Surrey-lane, Battersea, March 30.

SUPERB NEW PETUNIAS.

JAMES TURRELL begs to offer to the Public his new and choice Seedling PETUNIAS, which he can recommend with the greatest confidence, feeling assured they will give to all who purchase them great satisfaction. They were selected from a number of fine Seedlings bloomed in 1849; they are perfectly distinct, and of the most refined colours, and in shape unequalled.

EXACTUM.—This Petunia surpasses all others in form—almost a perfect circle; colour a pinkish white, with a fine dark throat, and well calculated to make a fine specimen plant, on account of its being short in the joints. *Vide* Dr. LINDLEY'S opinion in the *Gardeners' Chronicle* of 5th May, 1849:—"*H. J. H.* Exactum, pale blush, good in form, not over large, and nicely marked in the centre with violet veins; a very pretty variety." Price 7*s.* 6*d.* each.

LAVENDULA PENCILLATA.—A fine, large, bold flower, veined with dark purple; colour lilac. See *Gardeners' Chronicle* of 5th May, 1849:—"*H. J. H.* Lavendula Pencillata, large pale lilac, nicely veined all over the flower with deep violet; a pretty variety, but rather thin." Price 5*s.* each.

EYEBRIGHT.—This Petunia is of extra size, and novel in appearance; ground colour pale pink, shading to white, with a very fine dark eye. See *Gardeners' Chronicle* of 22d Sept. 1849:—"*H. J. H.* Pale blush with dark eye, slightly feathered with violet veins; good in shape and texture." Price 5*s.* each.

CONSPICUA.—Brilliant rose ground, with a dark blood-coloured stripe running up each of the divisions of the corolla; a conspicuous looking variety, not unlike a Convolvulus. See *Gard. Chronicle* of 22d Sept., 1849:—"*H. J. H.* Rosy pink, eye dark, and slightly feathered; good in shape, texture, and colours, but small." Price 5*s.* each.

The set of four for 20*s.* When three or more of any one sort are ordered at the same time, four plants will be given. Strong plants in the middle of May.

Providence Nursery, Ramsgate, March 30.

TO GRAPE GROWERS.—THE BLACK BARBAROSSA.

JOHN BUTCHER has a limited stock of the above truly magnificent GRAPE, introduced by T. C. Ward, Esq., from the Continent, and now for the first time offered for sale. It has the following good properties: the Vine, a most luxuriant grower, a free bearer; bunches, large and finely shouldered; berries, large and globular; flavour, equal to the Hamburgh; will hang on the Vine for at least another month to come, without sinking in size of berry, or losing in flavour; as hardy as the Hamburgh. Mr. Bevington, gardener to Mark Philips, Esq., exhibited the above Grape at the Horticultural Rooms, Regent-street, London, January, 1849, for which a Certificate was granted; and again on the 19th February, 1850, when a Banksian Medal was awarded it. Some idea may be formed of the magnificence of this Grape, by its being but the third year of the tree bearing fruit—21 bunches, averaging 4 lbs. per bunch, was the crop of 1849. To those families requiring late Grapes, it will prove a valuable acquisition. Good plants, from eyes, 21*s.* each, including package.—London Agent, Mr. FREDERICK WARNER, Seed Merchant, 28, Cornhill, London; and JOHN BUTCHER, Nurseryman, Stratford-on-Avon, March 30.

FERN SEEDS.

GEORGE BENNET begs to inform the lovers of Ferns that he has still a large quantity of NEW ZEALAND FERN SEEDS, and has much pleasure in announcing that they have vegetated. Price 2*s.* 6*d.* per packet. The names of the varieties are as follows: No. 1, Todia sp., variety australis; No. 2, Alsophylla medullaris, fine variety; No. 3, Cyathea dealbata; No. 4, mixed varieties of Hymenophyllum, Trichomanes, Adiantums, &c.; No. 5, mixed varieties of Alsophylla dealbata, or Silver Tree Fern; No. 6, Cyathea medullaris. A remittance must accompany the order either in postage stamps or Post-office order, made payable at Coventry, to GEORGE BENNET, Brandon, Warwickshire.

HORTICULTURAL TOOLS.

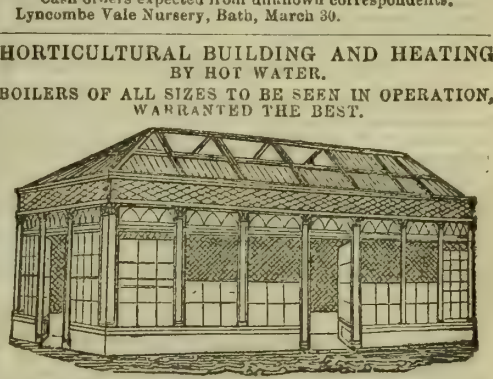
GREEN AND CONSTABLE, 36, King William-street, five doors from London Bridge, have a large assortment of GARDEN TOOLS, containing all the recent inventions, and including Lyndon's Patent Cast Steel Spades, Shovels, and Garden Forks, Lord Vernon's Hoe, Jointed Hothouse Syringes, Transplanting Tools, Registered Garden Labels, Ladies' sets of Gardening implements, Pruning Shears, Knives, &c. Agents for the Vitreous Porcelain Garden Bordering.—36, King William-st., five doors from London Bridge.

KITLEY'S GOLIAH STRAWBERRY.

JAMES KITLEY, in again bringing his SEEDLING STRAWBERRY before the notice of the Public, takes this opportunity of thanking those Friends who so liberally purchased in the autumn, and it being now the best time for planting, begs to inform them that he has a fine stock of healthy plants, which have been transplanted. See extracts from the *Gardeners' Chronicle.*

From the *Gardeners' Chronicle*—"STRAWBERRIES: *J. K.* Your Seedling Strawberry, 'Goliah,' judging from its size and appearance, is worthy of cultivation."

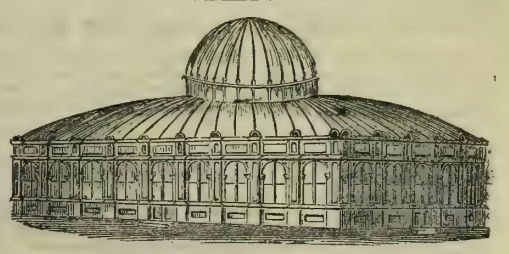
From the Gardeners and Farmers' Journal.—"STRAWBERRIES: *J. K., Lyncombe Vale.* We have great pleasure in bearing testimony to the exquisite flavour of your Seedling Strawberry, 'Goliah.' In our opinion it combines the piquant flavour of the Strawberry with the richness of the Pine, the delicious aroma of which it partakes in equal proportion with the taste. Apart from the queen of fruits, we certainly do not remember anything in this way that conveyed to our senses so delicious a treat as the noble fruit to be known to the world as 'Kitley's Goliah Strawberry.'"



Plants, 12*s.* per doz., or 4*l.* per 100. A liberal allowance to the Trade in plants, when 100 are taken.

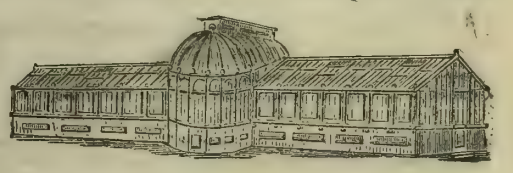
Cash orders expected from unknown correspondents.

Lyncombe Vale Nursery, Bath, March 30.



HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

BOILERS OF ALL SIZES TO BE SEEN IN OPERATION, WARRANTED THE BEST.



J. WEEKS AND CO., King's-road, Chelsea, HORTICULTURAL ARCHITECTS, HOTHOUSE BUILDERS, and HOT-WATER APPARATUS MANUFACTURERS, solicit an inspection of their various Works completed and in progress. Horticultural Buildings of every variety. BOILERS of all sizes to be seen in operation, and which they warrant to be the most effective and economical of any in use. The largest size Boiler is now effectually heating three extensive ranges of Forcing-houses, 230 feet by 22 feet, all Span Roofs and lofty, containing upwards of 50,000 cubical feet of air. Also various small and intermediate size Boilers, some of all sizes in operation. The consumption of fuel is very moderate, and the fires will continue from 10 to 15 hours without attendance. The extensive arrangements now in full operation on their premises, enables them to build to any extent, and at very moderate prices. Hothouses, Greenhouses, Conservatories, Forcing-pits, Frames, Glass Lights, &c. A very extensive collection of Stove and Greenhouse Plants, which are sold at very low prices. Plans, Estimates, and Catalogues forwarded on application.

J. WEEKS and Co., King's-road, Chelsea.

HOTHOUSE DESIGNING, BUILDING, AND HEATING.—Every description of Horticultural Structure designed, Erected, and Heated by Hot Water, common Flues, and other modes, on the most economical and improved modern principles. Testimonials and references from Noblemen and Gentlemen who have kindly patronised, for more than 15 years past, J. THOMSON and Co.'s Modern and Simple Mode of Constructing, Building, Warming, and Ventilating Garden Structures.

J. THOMSON having had full 25 years' experience as a practical Horticulturist, Landscape Gardener, and Garden Architect, in her Majesty's Royal Gardens at Windsor, Kew, and other places, most respectfully solicits the favours and patronage of Noblemen and Gentlemen about to form new, or to alter and embellish their present Parks, Gardens, &c.

Plans and Estimates for remodelling Parks and Gardens, or for Building and Heating Hothouses, and other Garden improvements, furnished on application to J. THOMSON and Co., Hothouse Builder, &c., King-st., Hammersmith, near London.

*** Rustic Summer Houses, Chairs, Vases, and similar Garden Ornaments, made on the shortest notice.

Natural Grass Seeds, Clovers, Turnips, Mangolds,

AND OTHER AGRICULTURAL SEEDS, CARRIAGE FREE.

JOHN SUTTON AND SONS, READING SEED WAREHOUSE, READING, BERKS,

Having many customers in South Wales, the West of England, and many parts of the South coast, have an Agent at Bristol to put goods aboard the Welsh and other Steam Packets, without delay, and free of expense; and have made arrangements with the Great Western, South Western, and South Eastern Railway Companies, for the Delivery of their Goods WITH DESPATCH.

They also PAY THE CARRIAGE to any Station on either of these Railways, or to any Railway or Packet Office in London or Bristol.

In handing their PRICED LIST of TURNIPS, MANGOLDS, NATURAL AND ARTIFICIAL GRASS SEEDS, &c., they beg to intimate that it is their constant care to send out ONLY THE BEST SORTS of Turnip and other Agricultural Seeds, and to CHARGE THE LOWEST MARKET PRICE for every article, which system has been the means of their obtaining an annually increasing Connection during UPWARDS OF 40 YEARS.

EXTRACT FROM THE BERKSHIRE CHRONICLE, DECEMBER 4th.

"In Messrs. SUTTON'S Sample Grounds are many kinds of Swedish Turnips, Mangold Wurzels, Belgian Carrots, Kohl Rabi, Drumhead Cabbage, and other Agricultural Roots, grown for the purpose of testing the merits of each sort, and selecting superior stocks for seed."

N.B.—The Prices of the Articles marked thus [*] being subject to constant fluctuation cannot be definitely quoted, but a good stock of each is kept on hand, and Samples, *with Prices according to the State of the Market*, may be had, post free, at any time on application.

Messrs. SUTTON and SONS having for many years paid especial attention to the examination of Natural Pastures, and the collecting of various kinds of Grasses which grow naturally in the various soils of Oxfordshire, Berkshire, Hants, Bucks, Wilts, AND MANY OTHER PARTS OF GREAT BRITAIN, for the purpose of introducing an improved system of laying down land to Permanent Pasture, are thereby enabled to supply the sorts and quantities of Seeds, varied to suit the soil for which they are intended; and the cost this season will be from **24s.** to **28s.** per acre, ACCORDING TO SORTS AND QUANTITIES THE SOIL REQUIRES.

NATURAL GRASSES, PERENNIAL CLOVERS, &c.

The following sorts MAY BE HAD SEPARATE at the low prices annexed to each. All the best and most suitable of them are contained in Messrs. SUTTON'S Mixtures for the several purposes described below.

	Price per lb.—s.	d.

Trifolium repens (White Clover)	*	
Trifolium hybridum (Alsike Clover)	*	

And many others.

As some Agriculturists feel a pleasure in making their own selection of Grass Seeds, the above List is presented with the lowest Market Prices; but the greatest economy and certainty of success will be obtained by procuring Messrs. SUTTON'S Mixture as under. Any other particulars required by post will be promptly given.

Mixtures for laying down to Permanent Meadow or Pasture.

The sorts contained in these Mixtures are grown in different localities and gathered separately by the hand, expressly for this purpose, by which means all noxious weeds are excluded; and each sort being kept separate, they are subsequently mixed in such sorts and proportions as are most natural to the soil to be laid down. The annually increasing demand for Messrs. SUTTON'S Seeds, has enabled them on a large scale to grow and collect the Seeds at much less expense than formerly; so that a mixture of the most suitable kinds can be supplied for **24s.** to **28s.** per acre, according to the sorts which the soil may require.

Mixtures for Reclaimed Marshes and Heath Lands.

Many acres of Land of this description have been successfully laid down to Permanent Pasture by Messrs. SUTTON with Seeds which they have found invariably to thrive on such soil; and THE COST FOR THIS PURPOSE WILL BE BUT **22s. 6d.** per acre.

Mixtures for Laying Down Gravelly or Chalky Uplands, and Sheep Downs.

For this purpose Grass Seeds are annually collected from dry and hilly districts, where they are found growing spontaneously; and, after many years' experience, Messrs. SUTTON can confidently assure their friends that a GOOD and PERMANENT Sward may be obtained on any upland, however dry or poor the soil. Cost of Seed, 28s. per acre.

Mixtures for forming Irrigated or Catch Meadows.

In this department also Messrs. SUTTON have been very successful, many customers having expressed their great gratification at the effect of these Seeds; one of these, an eminent Agriculturist, and MEMBER OF THE COUNCIL OF THE ROYAL AGRICULTURAL SOCIETY, has contributed A VALUABLE ESSAY ON THIS SUBJECT, which has been recently published by that Society in their Journal (Vol. X., Part II., page 462). COST OF SEED NOW REDUCED TO **26s.** PER ACRE.

Mixtures to lay down New Park Lawns.

For this purpose all coarse growing kinds are carefully excluded, and the Sward will at all seasons present a luxuriant verdure so desirable in Parks contiguous to the Mansion. The cost of Seeds for this purpose will vary according to the nature of the soil, and other circumstances.

Renovating Mixture for Improving old Pastures.

Many old Upland Pastures, Parks, and Meadows, are nearly destitute of Clovers, and the finer and more nutritious sorts of Grasses, in which case Messrs. SUTTON are in the practice of furnishing such sorts only as are wanting; if these Seeds are sown EARLY IN THE SEASON, the improvement in the Pasture will be very considerable, and at a small expense. Quantity of Seed required, 6 to 8 lbs. per acre. **Price 1s. per lb.**

Fine Grass Lawns in Flower Gardens, &c.

The great expense of cutting and carting turves from a distance may be avoided, and a SUPERIOR turf produced in a few months, by sowing Messrs. SUTTON'S LAWN GRASS SEEDS, which consist solely of the finest and shortest growing kinds, perfectly free from moss and other weeds. **Price 3s. 6d. per gallon, or 1s. per lb.**

SEEDS FOR EXPORTATION TO INDIA AND THE COLONIES,

Properly packed to arrive in good condition, price 1*l.* 10*s.*, 1*l.*, and 15*s.*, for choice and useful Collections.

EXPERIENCED FARM BAILIFFS AND GARDENERS RECOMMENDED.

*** *Sacks and Bays are charged at cost price only, and the full amount allowed if they are returned. N.B. Remittances with the orders are not required where satisfactory references are given.*

Our Descriptive Priced Seed and Plant List will be forwarded, prepaid, on application, by forwarding four postage stamps, as copies having the Newspaper stamp are now all distributed.

SEED AND HORTICULTURAL ESTABLISHMENT, SUDBURY, SUFFOLK.

NEW AND STRIKING VERBENA.

ARTHUR MACKIE begs to offer the undermentioned to the attention of Florists, with the fullest conviction that it will give entire satisfaction.

WOODSTOCK'S MAGNIFICENT.—A. M. having purchased the entire Stock of this unrivalled Verbena, offers it to the Public with the utmost confidence, being fully persuaded that it will surpass everything yet out in its class. The individual flowers cover a sixpence, and sometimes a shilling. It is of a very free habit and growth, and well suited for grouping. See *Gardeners' Chronicle*, Sept. 15, 1849.—"*W. K. B.* Colour bright rose, fading to pink; a remarkably fine variety, with much the largest flowers we have yet seen."

Fine strong plants the 1st of April, at 5*s.* each, free by post. Where three are ordered four will be sent.

MACKIE'S Descriptive Catalogue of Flower and Vegetable Seeds is now ready, and will be forwarded on receipt of two stamps for postage.—Norwich Nursery, Norwich, March 30.

BROMHAM-HALL GREEN-FLESH MELON IS THE FINEST FLAVOURED IN THE WORLD.

EDWARD TILEY having become possessed of the whole stock of Seed of that very superior MELON called "BROMHAM-HALL GREEN-FLESH MELON," he is now sending out good sound Seeds at 2*s.* 6*d.* per packet of 6 seeds; larger do. of 15 seeds, 5*s.* per packet. For further particulars of the above, see Advertisement in this Paper, February 9th. Also the following fine varieties can be highly recommended:

	s.	*d.*	
Queen Melon	1	6	per packet.
Bowood Green-flesh	1	0	,,
Beechwood do.	1	0	,,
Windsor Prize do.	1	0	,,
Emperor	1	0	,,
Fleming's Trentham Hybrid	1	0	,,
Duncan's Green-flesh do. improved ..	1	0	,,
Hampton-court Green-flesh	1	0	,,
Egyptian do. do. improved ..	1	0	,,

FIRST PRIZE CUCUMBERS.

Victory of Bath	2	0	,,
Gordon's White Spine	1	6	,,
Lord Kenyon's Favourite	2	6	,,

A packet of each of the three varieties, 5*s.*; if preferred, also a packet of Bromham-hall Melon will be included with the three Cucumbers for 7*s.*

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 16, Pulteney-bridge, Bath. A remittance must accompany the order, either in cash or penny postage stamps.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND Co. beg to notice their mixtures for laying Land down to Permanent Grass are now ready. The general satisfaction they have given for many years past, and the present low prices of 32*s.* per acre, allowing 2 bushels and 12 lbs. to each acre, they trust will ensure a continuance of orders. Mixed Seeds for improving old Grass Land, 1*s.* 3*d.* per lb.; fine sorts for forming Lawns, 1*s.* 4*d.* per lb. Their Priced List for the season of Turnips, Mangold Wurzel, and other Farm Seeds, will be forwarded on application to 26, Down-street, Piccadilly, London.

RICHARD SMITH begs to call attention to the following New and desirable Plants, which will be sent out by him early in April.

PETUNIA ECLIPSE.—This is a very beautiful variety, which will give general satisfaction. The flower is large and of good texture; ground colour pale rosy flesh, very fully marked with rich crimson maroon veins, forming in their density and peculiar shape a perfect star in the centre of the flower; it is a free bloomer, of good habit, and unquestionably the most beautiful light variety hitherto sent out.

CACTUS (EPIPHYLLUM) MAXIMUS.—This is a hybrid, of enormous size, between Speciosissimus and Ackermanni major, of a bright deep red colour, slightly tinged with purple in the centre; it is very showy, an opinion of which may be formed when it is mentioned that the flower when expanded measures 10 inches across. See Notice to Correspondent "S.," *Gardeners' Chronicle* of July 5th, page 460.

Price of Petunia and Cactus, 5*s.* each. Where three or more are ordered of either or both they will be charged 3*s.* 6*d.* each.

Nurseries, Worcester, March 30.

NEW GLOBE FUCHSIA, "KIMBERLEY'S INACCESSIBLE."—This splendid variety was raised from Williamsii, and is far superior, the blooms being twice the size of that variety; sepals very broad; tube rather short, of a bright glossy crimson; corolla rich deep velvety purple; habit very fine, and a free bloomer; foliage rich glossy green; will prove one of the greatest ornaments ever offered. Strong plants 10*s.* 6*d.* each, the 15th of April, may be obtained of C. KIMBERLEY, Florist, &c., Pinley, near Coventry, and of the following gentlemen, who have kindly ordered it: Messrs. WOOD and SON, Maresfield, Sussex; Mr. IVERY, Peckham, near London; Mr. GAINES, Surrey-lane, Battersea; and Messrs. WIDNALL and DAVIS, Grantchester, Cambridge.

MEETINGS AT WORTON COTTAGE, ISLEWORTH, for the Display and Examination of SEEDLING FLORISTS' FLOWERS, and other objects of Horticultural Interest.

The Editor of the FLORIST AND GARDEN MISCELLANY particularly requests that all Seedlings for the opinions of the Censors of that work may be posted, as far as practicable, so as to reach Mr. BECK, Isleworth, Middlesex, on the Wednesday morning of each week. Parties desirous of attending personally with their productions, by taking the 4 o'clock train for Isleworth from the Waterloo Station, will be put down within a few minutes' walk of Worton Cottage.

The Meetings will be held on Wednesday, April 3d, and each succeeding Wednesday, at 5 o'clock, P.M.

An Artist will attend these Meetings, to take coloured memoranda of anything particularly striking.

UNDER THE DISTINGUISHED PATRONAGE OF SEVERAL INFLUENTIAL MEMBERS OF THE ROYAL AGRICULTURAL SOCIETY.

RENDLE'S DESCRIPTIVE CATALOGUE OF AGRICULTURAL SEEDS IS JUST PUBLISHED, and can be had on application, GRATIS (for one penny stamp).

It contains a descriptive list of all the best Field TURNIPS, *with the lowest market prices, also a full descriptive price current of all the best sorts of* CARROTS, MANGOLD WURZEL, CLOVER, *&c., as well as all the best varieties of Permanent Pasture Grasses.*

The following is an extract from the Catalogue.

Rendle's Imperial Purple-top Swede Turnip ...	per lb. 0*s.*	8*d.*
Ditto ditto	per qt. 1	0
Skirving's Liverpool Swede ditto, per lb., 8*d.*	per qt. 1	0
Laing's Improved ditto ditto, per lb., 8*d.*	per qt. 1	0
Purple-top Scotch ditto ditto, per lb., 8*d.*	per qt. 1	0
White and Green Globe per lb., 6*d.*	per qt. 0	10
White Belgian Carrot	per lb. 0	10
Yellow Globe Mangold Wurzel	per lb. 0	8
True Italian Rye-grass	per bush. 7	0
Best English Red and White Clover	per lb., 5*d.* to 0	7
Large Cattle Parsnip	per lb., 1*s.* to 1	6

With every other kind of Agricultural Seeds at the lowest market prices. (See Catalogue.)

PERMANENT PASTURE GRASSES, sold in mixtures to suit various soils, at 30*s.* per acre, allowing two bushels of light seed and 12 lbs. of heavy seed to each acre.

All orders above 2l. will be delivered free of carriage to any station on the Great Western, Bristol and Gloucester, Bristol and Exeter, or South Devon Railways; or to any town in Devon and Cornwall; or to Cork, Dublin, or Liverpool, by Steamers.

Railway and Steam communication to all parts of Great Britain and Ireland.

For Catalogues and further particulars apply to WILLIAM E. RENDLE & CO., Union-road, Plymouth. ESTABLISHED 1786.

FLOWER SEEDS, POST FREE.

G. BAKER begs to recommend to the Nobility, Gentry, and his friends in general, the following very choice and superior assortment of FLOWER SEEDS, which are now ready to be sent out in sealed packages, at the prices affixed post free.

				s.	*d.*
100 packets choicest Annuals, including the newest and most approved varieties				10	0
50 Ditto	ditto	ditto ...	...	5	0
25 Ditto	ditto	ditto ...	...	2	6
12 Ditto	ditto	ditto ...	...	1	6
20 Ditto, choicest dwarf kinds, for filling beds ...			...	5	0
20 Ditto, half hardy and tender Annuals			...	5	0
12 Ditto, distinct varieties of Hollyhock			...	2	6
12 Ditto	ditto	Balsams	...	2	6
12 Ditto	ditto	Larkspur	...	2	6
12 Ditto	ditto	German Aster ...	...	2	6
12 Ditto	ditto	German Stocks ...	...	2	0
12 Ditto	ditto	German Larkspur ...		2	6
8 Ditto	ditto	Zinnias	...	2	0
20 Ditto	ditto	Perennials, including splendid mixed varieties of Verbena, Petunia, Hertsease, Pentstemon, Calceolaria, &c.		5	0

Remittances expected from unknown correspondents (either by post-office order or postage stamps).

GEORGE BAKER, Seedsman, Wells, Somerset.

SUPERB NEW VERBENA, ADAMS'S "MISS PAYNE."

The above beautiful variety was raised by Mr. W. Adams, Gardener to W. Hogg, Esq., Biggleswade, and will be found the best White Verbena of the season. To flowers of an extraordinary size it unites a delicious fragrance, which adds much to its attractions.

Extract from the *Gardeners' Chronicle*, Oct. 13, 1849. "W. A. A. Colour pale blush, fading to white; flowers very large, but narrow in the lobes; a good variety, on account of the size of its flowers, both individually and collectively."

Extract from a letter from Mr. J. Bundy, Gardener to — Trevor, Esq., Bromham Hall, Beds. "I beg to say I saw your seedling Verbena, and must say it was remarkably fine, much more so than any I had ever seen before, therefore you are at liberty to make what use of my name you may think proper."

Opinions, equally favourable, have also been expressed by Mr. Pullen, Gardener to the Hon. and Rev. H. C. Cust, Cockayne, Hatley, near Potton, Beds.; Mr. Pope, Gardener to Mrs. Harvey, Ickwell Green, Beds.; and many other gardeners, to whom reference is kindly permitted. Good Plants, post free, 5*s.* each; when two are ordered three will be sent.

London Agents: Messrs. HURST and M'MULLEN, 6, Leadenhall-street.

Address, SUSAN WOOD, Nurseries, Huntingdon.

P.S. Postage stamps received as payment.

BEAUTIFUL FLOWERS.—A few Packets of superior DOUBLE BALSAMS at 1*s.* per packet; also some fine DOUBLE SWEET WILLIAMS at 6*d.*, post-free. 100 packets of Flower Seeds, for 5*s.*; 70 for 4*s.*; 32 for 2*s.* 6*d.*; or 12 for 14 postage stamps, post free, warranted. A List, with directions for sowing, may be had, inclosing a sample packet for 2 stamps.

Address, JOSEPH GOLDING, Seed Merchant, Hastings.

TO THE LOVERS OF FLOWERS.

COLES'S SOLUBLE ALKALINE POWDER.—A highly stimulating and nourishing COMPOUND, for promoting the healthy growth and beauty of all kinds of PLANTS and FLOWERS, whether of hardy or tender nature, as well as a most efficacious application to Pines, Melons, Cucumbers, Strawberries, and every description of FRUIT and VEGETABLE. Sold, in Bottles at 1*s.* 6*d.*, 2*s.*, 2*s.* 6*d.*, 3*s.* 6*d.*, and 5*s.* each, by HENRY COLES, Seedsman, &c., 32, Cranbourne-street, Leicester-square, and to be had of all respectable Seedsmen and Chemists throughout the Kingdom.

Also supplied *wholesale* only, upon application to the MANAGER, at the MANUFACTORY, Middle Yard, Great Queen-street, Lincoln's-inn-fields. TERMS.—Cash on delivery. Post-office orders to be made payable at Charing-cross.

ROSEA STRIATA.—The Subscriber begs to inform the admirers of PELARGONIUMS that he has a few strong Plants of the above left at 10*s.* 6*d.* each, with an allowance to the Trade—with a few hundred of first-rate sorts to spare, at 5*l.* per 100 (strong plants) of Beck, Foster, Hoyle, and other raisers.—EDWARD PARKINS, Leamington, March 30.

SCARLET GERANIUMS, &c.

MARY CONWAY begs to offer good plants of the following:

SCARLET GERANIUM, "PRINCESS ROYAL," (Conway's), a splendid bright scarlet variety, of dwarf habit, and a very free and early bloomer, with a handsome horse-shoe leaf. A variety that lovers of scarlet Geraniums ought to possess. Plants 7*s.* 6*d.* each, and usual discount to the trade when three are taken.

QUEEN OF SUMMER (Henderson's), 5*s.* each.

The following 15 scarlets for 14*s.*: Eclipse, Goliah, Ivery's Scarlet, Ibrahim Pacha, Gem of Scarlets, Mrs. Maylor, Phenomenon, Punch, Royalist, Shrubland Superb, Symmetry, Tam o' Shanter, Tom Thumb's Master, Tom Thumb Improved, and Brompton Hero. With the following seven pink varieties for 21*s.*: viz., Cherry Cheek, Judy, Jenny Lind, Lucia rosea, Pet, Pink Nosegay, and Rosy Morn.

The following VERBENAS 12*s.* per dozen, or two dozen for 20*s.*: viz., Adonis, rose, fine; Apollon, clear dark purple; Bauces, dark violet, fine; Belle de Cointe; Criterion; Chauveerii, crimson scarlet, splendid; Eclipse, delicate pink, striped with rose; Favourite, dark purple, white eye; Gracieuse, blush lilac; Heroine, lilac, dark rose centre; Lord of the Isles, deep rose, fine, large truss; General Lamoriciere; Malvina, carmine; Morphee, blue, with white centre; Madame Gabrielle de Vandeva, rose centre; Madame Rattier, light pink, bright eye; Princess Alice, white, deep cherry centre; Reine Bacchanal, vivid scarlet; Royal Purple; Virgil, violet amaranth; Vesta, rosy purple, white centre; War Eagle, dark scarlet, maroon centre; Reine du Jour, blush white, rose centre; Monsieur Affré, crimson, fine.

The following Verbenas 6*s.* per dozen, autumn-struck plants, viz., Clotilde, pink striped; Emperor of China; Empress of Scarlets, Eppsii, Gem of the West, Grandiflora, Madame Passy, Vulcan Superb, Excelsa superba, Vampa, Marchioness of Ailsa, Defiance, St. Margaret, Picta, Speciosissima.

CALCEOLARIAS.—Shankleyana, new and shrubby, 12*s.* per doz.; Kentish Hero, 6*s.* and 9*s.* per doz.; amplexicaule, 9*s.* per doz.; Viscosissima, 6*s.* per doz.; Kayii, 6*s.* per doz.; and Aurantia multiflora, 6*s.* per doz.

PETUNIA "Beauty Supreme" (Conway's), 9*s.* and 12*s.* p. doz.

HELIOTROPIUMS.—Grisan, 9*s.* per doz.; Triomphe de Liege, 9*s.* per doz.; Souvenir de Liege, the best for bedding, 12*s.* per doz.

M. C. has also a good stock of the newest and best Ph'oxes, Salvias, Œnotheras, Antirrhinums, and Chrysanthemums, at moderate prices.

Earl's Court Nursery, Old Brompton, near London.

HORTICULTURAL SOCIETY OF LONDON.—The EXHIBITIONS OF FLOWERS, &c., in the Society's Garden, will take place on the following SATURDAYS, viz.: May 18, June 8, and July 13. TUESDAY, April 23, *is the last day* on which privileged tickets, at 3*s.* 6*d.* each, are issued to Fellows of the Society. Every Fellow is entitled to 24 such tickets, if paid for on or before that day.—21, Regent-street.

The Gardeners' Chronicle.

SATURDAY, MARCH 30, 1850.

MEETINGS FOR THE ENSUING WEEK.

MONDAY,	April 1	Entomological	8	P.M.
		Pathological	8	P.M.
TUESDAY,	— 2	Horticultural	3	P.M.
		Linnean	8	P.M.

"HAVE you heard," says a writer in "Chambers' Edinburgh Journal," "what the Recueil of the Societé Polytechnique" says about a new mode of turning WASTE STEAM to account? The proprietor of a factory took it into his head to introduce his waste steam under the roots of Pine-apple plants; and such was the combined effect of heat and moisture that a magnificent crop of ripe fruit was the speedy result, and of a much finer flavour than usual, owing to the growing part of the plant having been daily exposed to the open air."

This is a subject to which we gladly direct attention, for we have long felt convinced that the true places for forced vegetables and fruits of all kinds are near fixed steam-engines, whose waste steam will supply all the heat that is required, without the cost of a farthing for fuel. While glass was dear this was a suggestion which it would have answered no good purpose to have made: but now that timber is cheap, glass about one-sixth of its former price, and that bricks may be expected to fall 50 per cent., it is evident that we want no Lisbon for early Peas, or New Providence for Pine-apples, or even Penzance for winter Broccoli, but that all such produce may be grown cheaper, and as well or much better in every manufacturing town.

As matters are now arranged the heat belonging to the waste water of steam-engines is utterly lost, instead of being economised, and applied to the production of food, or luxuries, in both the animal and vegetable kingdom. There is no conceivable reason why ponds should not be warmed, and made to produce magnificent marketable fish, bred beneath the foliage of Water Lilies and other beautiful aquatics of hot countries, while the ponds themselves impart a gentle warmth to the neighbouring soil, teeming with early Kidney Beans, early Lettuces, early Asparagus, early Salads, Green Peas in March; Peaches, Plums, and Apricots in May, with Grapes and Pine-apples at all seasons. To effect this, little labour is wanted, no great elevation of roof, no wide span, involving costly rafters of timber or metal; but a series of low span-roofed pits, half sunk in the earth, to save materials. In such places the waste water would give warmth and moisture; the moisture might be regulated by various cheap mechanical contrivances; and by the application of a little steam power the atmosphere of such places could be kept in any degree of agitation that might be required for the healthiness of

the vegetation. In short, summer breezes might blow, at the command of a screw, even though the external air was that of Iceland at Christmas.

The difficulty that gardeners experience with forced crops arises from the impossibility of ventilating them—from the difficulty of keeping the earth, in which the roots grow, warm without over-heating—the air, in which the leaves grow, dry without withering—and in maintaining a proper temperature without such a consumption of labour and fuel as render the charges to a consumer such as to excessively limit all sales. At the side of manufactories all such difficulties vanish. The power which works the looms and the spinning-wheels will also work the houses in which plants are grown for market, without the effort being felt, and with little aid from manual labour. Canadian timber cut at the saw-mills, duty-free bricks, glass at 4*d*. a square foot, a little engineer's work, and a clever gardener, will furnish all the rest.

Suppose that a tank made of bricks, lined with inch Canadian planks, and 6 feet wide, were caused to enclose a given area; that the tank were surrounded by 12 feet beds separated by pathways from the outside walls, and that the area enclosed by the tank were divided into 6 feet beds accessible by narrow sunken paths. It is evident that by a series of ridge and furrow roofs any such area may be perfectly covered over; and it is equally evident that, by some mechanical contrivance, such for instance as Hurward's screw or Jones and Clark's rack and quadrant, the whole of such roofs could be opened or closed at pleasure, without the least difficulty. The water from such roofs might be carried off through hollow brick supports, upon which the wall plates might be made to rest; and if the soil were dry enough, the whole structure, except the roof, might be sunk, so as to avoid the cost of thick outside walls, and to retain the heat extricated from the tanks. Head-room for working under might be obtained by excavation, and the earth so excavated would make the raised beds, which would be necessary in order to bring the crops close to the light. It is probable that air-heat enough for most crops would be obtained by this arrangement alone; but if it were otherwise, glazed pipes could be adapted laterally to the tanks, and made to convey more heated water to any place in which it could be required. In the same way subterranean irrigation might be effected; and in short every application of heat and water of which a gardener has need.

In such buildings plants would be grown as in the open fields, beds of Radishes and Spring Onions in the coldest parts, beds of Strawberries in others somewhat warmer; Seakale and Rhubarb in chambers under the footpaths; Lettuces, Endives, and all sorts of Winter Salads in the same quarters with Radishes and Spring Onions; Pine-apples in the warmest parts; Vines on the rafters, at such a distance as not to overshadow the crops beneath them; Peaches and Nectarines and Apricots, with Figs, Plums, Cherries, Raspberries, and the like, in dwarf orchards apart, with the same crops beneath them as in the open fields. All this might happen in winter; in May the glass roof might be wholly removed, and the ground cropped as a market garden, with this great advantage that still there would be an advance upon the seasons, and that the genial warmth of the tanks and under-ground channels of heat would give to English crops an excellence now only known in the sun-heated soil of southern countries. The experiments upon out-of-doors cultivation of the Pine-apple in summer, so cleverly tried at Bicton by Mr. Barnes, the gardener to Lady Rolle, have conclusively established the fact that Pine-apples thus produced are infinitely better in flavour than such as are nursed in a common hothouse. It is probable that they would not cost much more than Cabbages; and at all events that if sold at the price of the wretched things called West Indian Pine-apples, they would yield a great return to the grower.

In this way quite a new description of market gardening would spring up, a new employment for labour be discovered, and a new field for the profitable investment of capital. When carried out, Paris and Berlin and Brussels may be supplied with forced fruits and vegetables from Manchester, and new elements of national competition be thus introduced, by which all may largely benefit.

This kind of gardening is not, however, precisely what the writer in Chambers' has referred to. The subject of his remarks is gardening without protection of any sort, by aid of earth-heat alone; quite a distinct question, to which we may address ourselves next week.

SALADS, MACHE, AND SCAROLE.

There is certainly not the same amount of attention given to the cultivation and extended production of salads in this country as in France, and the reason I apprehend exists in the circumstance of a more limited demand for the article on this side of the channel. Everyone eats salad in France; hence extraordinary attention is paid by the market-gardeners to its culture. Les Jardins Maraîchers, about Paris, are exceedingly well managed, and I have often wondered at the abundance, cheapness, and excellence of the salads in early spring in Paris. Both Lettuce and Endive may be obtained for one or two sous in February and March. On inquiry, the market-gardeners, who form, by the way, a distinct and peculiar class, have always been quoted as examples of industry and skill in their business; the truth of which encomiums subsequent visits to their gardens fully proved.

Although I am prepared fully to admit that we may have as good a salad in the winter, or indeed at any season, in England as in France, yet I submit that as the production of salad throughout the winter season requires in France especial skill and attention, and means to boot, so we cannot secure an abundant supply without similar means and appliances, which with *their* care they are obliged to employ. The French market-gardener has generally an unlimited supply of hand-glasses, "Cloches," which resemble in shape our bell-shaped propagating glasses, and can be bought for about 1*s*.; these he finds of wonderful use in advancing his early salading; added to this, extensive ranges of frames are at command, and for protective purposes, instead of employing Russian mats, the warm cheap paillisson or straw mat is brought into use. The "Bon Jardinier" gives an account of the system pursued in the cultivation of Mache and Scarole, which may afford some desired hints to those of your readers who are interested in the matter, and which therefore in effect I have translated, and subjoin.

"*Mache* is a small salad which is sown every eight or ten days, commencing from the middle of August and continued till the end of October, broadcast, in light friable mould which has been manured the preceding year. The soil should be lightly raked over it, and it should be watered when it becomes necessary. As Mache is used entirely while young, in gathering the forwardest parts it will be kept sufficiently thinned.

"*Scarole.*—The ordinary cultivation of this new Endive is precisely similar. There are several methods employed for securing a supply during the winter and spring months. For early forced Scarole they sow in a strong heat under glass in January; 15 or 20 days after the seeds have vegetated they are pricked out, on another hotbed, where a less heat is necessary; air is freely given when the weather permits. When the plants are sufficiently full they are tied up as they are out of doors.

"Another method now used by several cultivators consists in sowing in October on a bed slightly warm, and pricking out the plants subsequently in a similar situation, covering them with *cloches*, and taking care to provide them with a moderate amount of warmth, and so securing them from severe weather. There exists a third method, called 'culture à froid,' since practised several years with success. They sow about the 10th or 15th of September, in a cold frame; about three weeks after they prick out, also under glass; then again replant in November and December, close together, keeping the lights constantly closed, and in severe weather keeping the frost from them by ample coverings."

It will be thus seen that with hand-glasses and a frame at disposal, which nearly every gardener possesses, the above salads may be commanded at the season they are required. *W. I.*

ENDIVES.

Endives are divided into two classes:

A. Curled.

B. Batavian, or Broad-leaved.

Complete descriptions of most of the varieties of Endives, now, or formerly cultivated, are to be found in the Transactions of the Horticultural Society, vol. vi., p. 133. Twelve varieties are there enumerated, but three of them are all that are usually kept by English seedsmen, namely, the Green Curled, White Curled, and the Broad-leaved Batavian.

Class A. Curled Endives (Chicorée Frisée, of the French).

French Small Green Curled, alias Fine Curled, Chicorée frisée fine d'Italie, Chicorée d'Été, C. fine d'Eté. A small, very dwarf sort, which cannot be tied up, but blanches readily when covered. It is only fit for early use.

1. *Small Green Curled*, alias Green Curled, Chicorée frisée, Chicorée de Meaux, Chicorée Endive. Leaves much cut and curled, from 6 to 7 inches long, lying flat on the ground, heart-leaves full and close. Formerly this was the sort chiefly cultivated in France; but for early sowing the preceding sort is now preferred, because it does not run so readily and hearts sooner.

2. *Large Green Curled*, alias Green Curled, Cut Yellow Winter Endive (of the Germans). Leaves longer and rather more upright than those of the Small Green Curled. It ties up well to blanch, is hardy, and not subject to rot.

Italian Green Curled, or Indivia Riccia. Leaves narrow, divided to the very midrib, segments also much cut and curled; whole plant dark green.

Dutch Green Curled, alias Large Green Curled (of the Dutch). Scarcely worth distinguishing from the Large Green Curled above enumerated; it differs in the outer leaves being broader, deeper cut, and not so much curled. It blanches well, and is hardy.

Long Italian Green Curled, or Indivia Longa. Resembles the Italian Green Curled, the leaves being deeply cut, but their segments are not disposed to curl, and is, on the whole, inferior.

White Curled Endive, alias White Endive, Chicorée toujours blanche, Chicorée blanche. Leaves 7 or 8 inches long, with a very open heart, growing flat on the ground. The whole plant is of a pale yellowish colour. It is best when cut young for salads, as the French use it. In a full-grown state the leaves are tough, very bitter, and do not form a good heart; therefore it should not be sown with the view of using it otherwise than for the purpose above mentioned.

Stag-horn Endive, alias Corne de Cerf ou Rouennaise. Leaves deep green, finely cut, but not much curled; heart full, yellow, and tender. Preferred at Rouen, but not at Paris, where they find it more apt to run to seed, or otherwise it decays sooner, than the French Small Green Curled.

Chicorée Mousse. A new sort; a finely curled variety of the preceding.

Class B. Batavian or Broad-leaved Endives; Scaroles of the French.

3. *Broad-leaved Batavian*, alias Broad-leaved Endive, Double Yellow, and Common Yellow of the Dutch. Leaves long and broad, the edges somewhat ragged, the outer ones particularly upright. It is the sort of Batavian Endive most commonly cultivated, and requires to be tied up for blanching. *Curled Batavian*, alias Fine Curled and Yellow Curled Batavian. Leaves not so large as those of the preceding; they grow flat on the ground, and are curled at the edges. The heart forms of itself; is small, and lies close to the ground.

4. *Small Batavian*, alias Scarole petite, Scarole courte, Scarole ronde. Leaves pale green, broad, of moderate length, slightly ragged at the edges, inner leaves hooded at the top, naturally forming a good heart, blanching with little trouble, and is mild and sweet, compared with many others.

Large Batavian, alias Scarole grande, Scarole de Hollande. This can only be described as a large variety of the preceding, scarcely hearting so well.

Lettuce-leaved Batavian, alias White Batavian, New Batavian, Scarole à feuille de Laitue, Scarole blonde. Leaves large, obtuse, ragged at the edges, of a pale colour even when young; require to be tied up for blanching. This should only be cultivated for early use, as it is tender both as regard damp and severe weather.

Numbers are prefixed to such of the above as are considered the best for general cultivation. *R. T.*

DISEASES OF PLANTS.

(*Continued from page* 181.)

Genus IV. Incisions.—By incisions I mean a solution of continuity effected by a sharp instrument such as an axe or knife, without laceration or removal of any portion of the substance. There are two species, first the *longitudinal*, and second the *transverse* incision. The cure of the first may be for the most part left to Nature, as the wound heals most readily, especially in indigenous plants. Occasionally, however, some attention is requisite, in the case of delicate plants from hot countries, or where the juices are gummy or resinous, as in such plants the incision is apt to open too much, and the accumulation of sap may be productive of injury. The second species may be readily cured if taken early. Every delay may be fatal. A transverse wound made by an axe if neglected, will either never heal, or at any rate leave a lasting defect with a prominent scar. But if, while the wound is fresh, the parts be united and covered over with a cement of cow-dung and clay, it will heal without further trouble. It will sometimes be necessary to bind the parts together with strips of bark, bass, or some such material.

Genus V. Amputations, *or separation of a part of the body of a plant from the remainder by some instrument. First species.* Simple Amputation.—Under this name I designate such separations of a healthy portion of the tree as are made by pruning or taking grafts. Although these are really mutilations, they are much less injurious than those of the second species. Nevertheless, it is certain that our practice of cutting off heedlessly so many roots and branches of the trees we transplant, and the pruning trees every year so close, without any consideration, are productive of much mischief. Some, if not all, French writers on rural economy enumerate amongst the causes of disease in trees, especially fruit trees, the *abreuvoir*; that is, the facility which amputated branches give to wet to penetrate into the inner parts. We see instances of it every day in our own trees. Moschettini attributes the *celone* of Olives to injudicious amputations. Thence, obliged, as we are, to make simple amputations, are derived the two following important rules. First, let the cut be always made on an inclined plane downwards, in such manner that the bud destined to form the new branch should never be on the lower side of the section, but always on the upper one. Secondly, let the cut be flat and smooth, the edges of the wound as even as possible, and, if the branch is of any size, let some appropriate cement be applied.

Some persons, persuaded that the way to have a tall tree is to prevent its growth in thickness, are all day with the pruning knife in their hand, cutting off all the small branches which shoot from the stem. The tree grows in height, but does not thicken in proportion; it remains weak and slender, and, though apparently vigorous at first, it is checked and becomes unhealthy. Besides that, we err frequently in the time of year for pruning, which, for the early trees, such as the Peach

and Apricot, should be from the end of June during the whole of July; and for Pears, Apples, and Plums, from the end of July during all August. The same rule applies to forest trees. Let prunings be as moderate as possible, and at their proper season, and so regulated as that all the branches of the tree be not cut down at once, commencing at the bottom and proceeding upward.

Second species. NECESSARY AMPUTATIONS.—There are many cases where the preservation of the plant absolutely requires amputation. By this course alone can it be freed from ulcers, carcinomy, or hæmorrhage; or the sad consequences of contusions, lacerations, punctures, or fractures, averted. If the plant cannot entirely resume its pristine vigour, at any rate it may thus be restored to a life of many years, and may fructify almost as before. The importance of these amputations induces me to enter into the subject with some detail.

I refer to Roger Schabol's treatise on wounds those who love to compare the operations of a surgeon on animals to those of the cultivator on plants, and they will there find, that according to this author, what happens in the healing of animal wounds occurs also in those of plants. It will be seen that the learned Boerhaave did not disdain to undertake to cure certain trees of the public walks of Leyden, which a miller had cut down in the middle, because they intercepted the wind from his windmill. I will confine myself, before speaking of the mode of curing vegetable wounds, to an allusion to the mode in which, according to physiologists, the closing of such wounds is effected by Nature. Where a portion of substance has been cut off, a callus is formed both above and below the wound; these calli gradually approach each other till they touch and unite over the scar. Nature does not always take the same time for this purpose, it is sometimes the work of a few months, sometimes of a year or more; and if the wound is large it never closes. It must be observed, also, that when any portion of the woody tissue is affected it is never cured, but merely covered over by the fresh wood.

The cultivator who is under the necessity of making amputations should do all in his power to assist Nature in healing over the wound, and for this there are two points to be specially attended to. First, the reducing the amputation as much as possible to a state of simplicity. Let the edges of the wound be pared clean, so as not to leave any loose strips of bark or fibres, any corrosions, &c.—cutting with a sharp knife the whole wound to a smooth surface, and if possible inclined, so that the section shall be so directed as to be least exposed to the prevailing winds. If it be an old, thick-barked tree, it will be necessary to examine around the cut, to see that there are no insects harboured. The next care is to apply some one of the cements I am about to speak of.

In all injuries, where any humours are exuded, or where there is any rotten matter, the injured part should be carefully cut out to the quick. There is nothing more certain nor better established by experience than that vegetable ulcers cannot be cured unless all the diseased portion be cleared out.

All agricultural writers recommend some different kind of plaster for covering wounds of all sorts; and if we believe their different proposers, all these plasters must be equally good. They may be reduced to two classes. Some lay down as the basis of their cements or plasters, wax, turpentine, pitch or some such bituminous matter. Others make use of much more simple materials. I am not at all disposed to recommend those substances which, when exposed to the sun, are liable to liquify and injure the plant. I do not approve therefore of the use of wax for covering grafts. Edelcrante has invented one of this class, however, which is less liable to inconvenience. It consists of a mixture of Flax, litharge, and calcined bones.

It is, however, Forsyth's cement that deserves the preference. Take one measure of fresh cow-dung, half a measure of lime rubbish, half a measure of wood-ashes, and a sixteenth of a measure of pure river sand. Pass the three last ingredients through a fine sieve, and mix them well up with the cow-dung till the whole has acquired the consistence of plaster of Paris when being put into the mould. For this purpose it must be kneaded up in soap-suds, or, still better, in urine. The cement must then be laid on the wound to the thickness of about the eighth of an inch with a little brush. When thus laid on it must be sprinkled over with a powder composed of five parts of wood-ashes to one of calcined bones. Every half hour this sprinkling of the powder must be repeated till the whole surface is dry and smooth. Cadet-de-Vaux, in the first number of his journal, entitled "Bibliothèque des Propriétaires Ruraux," recommends an analogous cement, but composed of a greater number of materials. The merits of Forsyth's, however, is sufficiently established by long experience, and there is no use in seeking another. It is only the Orange tribe that it does not appear to suit very well. If all the cement prepared is not used, the remainder may be kept in an earthen vessel, keeping it covered with urine. Where lime rubbish is not to be had, fresh lime will answer the purpose. Some particular people, instead of urine, use blood of oxen diluted with water. When the wound is hollow, or the wood must be deeply scooped out in order to remove the diseased part, then, before applying the cement, the inside of the part cut must be well washed with a rag steeped in some of the mixture made fluid. The whole of the cavity must then be filled with the cement. Some have recommended plastering over the young shoots of trees with this cement in autumn, when it is feared, from their natural weakness or accidental unhealthiness, that they may suffer from the winter frosts. I myself have had no opportunity of judging of the success of this practice.

Forsyth strongly recommends attention to the state of the roots, which will suffer more or less from the diseased state of the trunk. They should in such cases be opened out and examined with care, the affected parts cut out from the main branches, and the hollows filled up with the same cement, mixed up with clay. The mass of cement must be strongly pressed in with the hand, to prevent the wet from penetrating, and raised beyond the diameter of the root, the surface being so inclined as to facilitate the draining off of water, and the whole covered up again with good soil. Some mix up a portion of fine gypsum with the composition.

The experiments of Dondi, and many others, have with us fully confirmed the advantage of the above-mentioned cement. I have also found the composition so well known under the name of Onguent de St. Fiaere, made up of a mixture of cow-dung and clay, to be an excellent one to apply in cases of amputation. Some cultivators cover the wounds left on cutting off large limbs, either with cow-dung or with clay, but without mixing them. This is a bad practice, because the sun will cause it to crack, giving access to wet, and above all to insects, who will soon do much mischief to the tree.

VILLA AND SUBURAAN GARDENING.

WATERING is an important operation in gardening, but it is one in which it is difficult to give precise directions for the guidance of the inexperienced amateur. On account of their artificial position, plants in pots require to be watered with great care and caution. The capabilities of the plant to take up water must be determined, the nature of the soil in which it is growing, the conditions under which it is potted, whether in a state of rapid or slow growth, the season of the year, the temperature to which it is subjected, are all matters of great importance, requiring much consideration. Nevertheless, watering generally is heedlessly and incautiously performed, as if its due application had no relation to the plants' well-doing. Half the plants put into pots are either killed, glutted, or starved by injudicious watering. One thing should be rigidly observed in giving liquids of any kind to plants, and that is, their temperature should never be lower than that of the atmosphere in which the plants are growing; if otherwise the roots get chilled, the growth receives a check, and the whole system is violently paralysed. No immediate ill effects may be visible, but ultimate injury is certain and unquestionable. Another rule which may be laid down in watering plants in pots, consists in never giving water until it is actually required, and then enough should be given to reach every part of the ball. Watering by driblets is the worst of all practices. By such a system one portion of the roots is perishing with drought, while the other is surfeited with water. To determine therefore when a plant requires water is not so difficult as may at first appear. It is not always when the surface soil looks dry that the roots are in that condition, and to administer water on that evidence alone would be, to say the least of it, a bad practice, more especially as regards plants which require considerable care in their cultivation. The plant itself will frequently indicate its wants in this respect, but it not always judicious to wait for such proofs, neither would it be prudent to turn the plant out of the pot, in order to ascertain its condition; although in nice cultivation, and in some especial cases, this is occasionally done, but in general practice it is to be avoided. A little careful observation is of course necessary, especially with respect to plants grown in peat soil; and if any uncertainty exists as to whether or not the plant wants water, strike the pot with the knuckle on the side; the ring produced will, with a little practice, prove an unerring guide. If this plan is followed for a short time, the ring of the wet pot will be readily distinguishable from that of the dry one; this, therefore, taken in conjunction with the appearances which the plants exhibit, must determine when water is to be applied or not; but be it remembered that the mere appearance of a dry surface is a false and fatal guide with respect to the requirements of the plant. *Pharo.*

Home Correspondence.

A Country Curate's Garden (see p. 188).—In reply to the request made by a "Country Curate," as to the most remunerative method of managing his garden, permit me to say, keep bees! And in regard to the immediate stocking of his little garden plot: Let the ground be first made level; and at 1 foot distant within the boundary-line of the same, let a dry walk be made with gravel or coal-ashes (edged with bricks), 2 or 3 feet wide, as may best suit the dimensions of the area. Within this walk, at 1 foot distant from its edge, let bushes of the small red Gooseberry, and of white, red, and black Currants, be planted at 6 feet distant from each other. Within the lesser area, surrounded by these bushes, let the ground be divided into three portions; one to be occupied by early Potatoes, a second by summer and winter Cabbages, and a third by Turnips. The little border, on the outer side of the walk, to be planted with Thyme, Sage, and other herbs, and patches of Mignonette, and other flowers suitable or bees. Between every bush, above mentioned, let a bee-hive be placed. Each hive should be of moderate size; that is, containing, by measure, about 2 gallons, and be occupied by a strong swarm of bees that has issued naturally, or been taken from its parent hive, artificially, early in the month of May. The bushes, above noticed, besides producing fruit for the table, will ensure an early repast for the bees, when they put forth their first blossoms in spring. The Potatoes will furnish a seasonable supply when they are dear in price; the Cabbages will be serviceable at all times, and of the Turnips, after they have been culled for the table, there will be a sufficiency left to produce an ample store of bloom for the support of the brood of the bees in the autumn, or in the ensuing spring. The keeping of bees turns to a far better account than that of maintaining poultry; it is a far more profitable and constant source of interesting amusement to a cultivated mind. Poultry disfigure a garden, and do much injury to all its fruit. Bees, on the other hand, are always an ornament, as well to the rich man's nice parterre, as to the more humble cottager's dear little plot—and never do harm to the produce of either. Their honey is ever to the richer man an agreeable luxury, it being considered, of old, the chiefest of all sweet things, and to the poorer man, besides being often a medicine in sickness, is, when hives are properly managed, an annual source of profit. But in order to obtain this profit, the bees must, like everything else, be attended to; there are some little cares requisite, such as keeping their hives quite dry, at all times, and clean, and guarding them from any interruptions or any annoyance during their daily innocent occupations. They should never be disturbed during the day, unless some necessary operation is required. The approach to the hive should always be at the back part, for then the bees will not resent anything being quietly done to them or for them. For instance, if after having worked a considerable time in their hive, they appear to want more room, a raiser may be added, without fear of molestation; or an artificial swarm may be made with the greatest facility; or the hive may be lifted and weighed, by being poised in the hand at any time; or the bees may be fed; or may be deprived of part of their store; or glasses may be added; in fact, anything may be done with a hive of bees, if easy access be had to it at the back, at all times. With regard to books on the subject of bees, there are many worthy the attention of the curious, such as Bevan on the Honey Bee, and Scudamore on Artificial Swarms; and many also which may prove serviceable to the cottager, such as Bonner, Wildman, Keys, and Wighton, on the general management, all of which may be had of any of the London booksellers. *Apiarius.*

Death of large Elm Trees at Southampton: Vines Killed by Gas.—The remarks at p. 182, respecting the destruction of Elms by gaseous influence, have brought to my recollection a fact I learnt at Plymouth from a gentleman who had suffered through the escape of gas into his Vine-house (the back of this house forms the street boundary, along which was led a gas-pipe in the usual way). His Vines a year or so since began to flag, the gardener was considered the culprit and dismissed for neglect; another took his place, still the Vines did not improve, but he observed a strong smell of gas on opening the house in the morning, and told his master. This led to investigation, and it was discovered that the roots had found their way beneath the wall, and had reached the gas-pipe, from which there happened to be an escape of gas—the fibres of the root perished by the contact, and shrunk. The gas rushed into the vacancy thus created, literally eating its way onward, by means of this shrinking process, until it had destroyed the Vine, and found its way into the house, carrying death in its train. Should this help our Southampton friend, I doubt not the case from Plymouth would be willingly confirmed by others. *E. T. W.* —— Some three or four years ago I observed Elms, in the neighbourhood of Wandsworth-common, attacked by great numbers of a small coleopterous beetle, which perforated the bark in all directions, from whence the sap flowed profusely. In the day time these perforations were visited by myriads of flies, wasps, butterflies, &c.; and at night by nocturnal lepidopteræ. Since these minute enemies have made their appearance, many fine specimens of Elms have died, and I certainly lay the burden of the mischief on the shoulders of the Scolytus destructor. *C. Wood, Wandsworth-common.*

State of the Thermometer, against a north wall, at Killerton, Devon, between March 7 and 13, inclusive:

	Max.	Min.		Max.	Min.
7th	48	44	11th	52	31
8th	53	41	12th	49	30
9th	51	35	13th	51	33
10th	51	35			

Phosphoric Rat Poison.—Many complain that it is useless. Perhaps the reason is its being used when old and stale; then the vermin will not touch it, but if fresh it is most destructive. The only drawback, which applies to all poisoning of vermin, is that the dead animals are sometimes eaten by pigs, which are also poisoned, and that the rats now and then die under the floors of houses, causing intolerable stench. *Sigma.*

Doubling the Polyanthus.—Being not much more than a cottage gardener, with 6 or 7 frame lights, made by myself in a rough manner, out of odd pieces of wood, and glazed by hook and by crook, Polyanthuses have been very eminent among the chiefs which my turf-built frames have given protection to. I am therefore naturally interested in the observations which this flower has received in your two last numbers, particularly "Wissingham's" suggestion of doubling and

obtaining a higher standard of perfection ; but although I can appreciate the beauty this standard would produce, yet "Wissingham" does not favour us with such undeviating directions as a plain grower like myself can at once follow. Perhaps, however, he will be good enough to fill up the deficiency. Nevertheless I fear that doubling is a task beyond even the originality of "Wissingham," although, if effected, nothing could equally add to the improvement of this plant as an early bloomer, border, or a bouquet flower. *Flora, Camden-town, March* 26.

Birds : Food of Titmice—Mr. Graham having called in question the accuracy of my statement, respecting the food of titmice, I feel bound to reply to him. I state most positively that no British species of titmouse ever feeds upon the buds of trees. Let Mr. Graham use a small telescope, and he will find that it is insects alone for which these useful birds are searching. The utmost injury they ever do, is displacing a bud or two in search of their food, and this is a very rare occurrence. I have examined the stomachs of every British species of titmouse, except the crested tit, and no portion of a bud did I ever find, and having for many years paid close attention to our British birds, and having set up for my collection about four-fifths of our native species, I have had ample opportunities of examining the contents of their stomachs at all seasons of the year, and I never found the buds of trees in the stomachs of any birds, except those of the bullfinch and common sparrow. If Mr. Graham depends upon the authority of gardeners, he will often be in the wrong. I have myself tried in vain to convince a gardener here, that the larvæ of the lady-birds are his friends, and feed upon aphides. He insists that they destroy the plants. This is one out of numberless similar instances which I could adduce. *Henry Doubleday, Epping.*

Glass Pipes for the Conveyance of Water.—I have devoted much time in trying experiments with glass tubes, in order to ascertain if possible the plan of making them suitable for locomotive engines, as the heat and pressure they have to stand is very great. I tried the process of annealing, which is keeping them in a furnace for 24 hours and gradually cooling them down. I also tried boiling them from 24 to 48 hours in oil, strong solution of soda, and a variety of other plans, without success. I have however discovered the secret at last ; or, at least, I have found a plan of making them by which they stand very well, although they are still liable to break ; but if they will stand in a locomotive engine they will do for most purposes to which they can be applied. I have just executed an order for glass tubes for conveying water in a nobleman's mansion, but as I executed it for another party, I am not at liberty to mention names. My glass tubes are used by the South-Western Railway Company, and I believe give satisfaction. Your correspondent may rest assured that properly made glass pipes will answer the purpose of conveying water. *Henry Baker*, 90, *Hatton-garden, London.*

Spent Tanner's Bark a good Manure for Strawberries.—Perhaps the following experiment with Strawberries in tan, which I saw made near Edinburgh, may prove useful. The soil was very light, and appeared unfit for their growth, yet finer fruit or of better flavour I have seldom seen. This was entirely owing to a covering of old tanner's bark, about an inch thick, being applied between the rows. The bark not only kept the ground moist and the fruit clean, but it is the material of all others in which this plant most delights. Many persons may have remarked how almost all plants, but particularly the Strawberry, will root into the old tan of a bed in which they have been forced, and yet because they know new tan will kill weeds, they do not think it valuable as a manure. In the same garden were beds of Strawberries which had not been covered, but after growing and flowering well, these bore no fruit worth gathering (a very common thing if the soil is too light) ; others were almost burnt up, whilst those to which the tan had been applied were luxuriant, and the ground was covered with fine runners fit to plant out, though the fruit was just in perfection—an uncommon circumstance near Edinburgh. *I. R. Pearson, Chilwell.*

Vinery and Cow-house.—I have just started something novel in a glazed cow-house, which it has occurred to me you might like to hear of. The cow-house is 96 feet long, span-roofed, the roof being made the same as for slating, but the rafters (supplied by Mr. Lewis, of Stamford-hill), rebated. It is glazed with Hartley's patent rolled plate in panes, 24 inches long by 29 inches wide, so that it is very light. An iron bar is run across midway between the ridge and the eaves, to supply the place of a purlin. The roof cost a few pounds more only than slate. Very ample ventilation is provided for, all round the house, by a ventilator along the whole ridge. Vines are planted in front of the house at every two feet (the distance between the rafters), and it is presumed that the shade from these, and an abundant supply of fresh air, will prevent the cattle from suffering from heat, even in the height of summer. There will not be much escape of ammonia, as gypsum diluted with sulphuric acid will be used on the floor ; and if some little does rise, probably it will be of service to the Vines. I have been a good deal twitted as to how I mean to prevent the farm people from helping themselves to the Grapes, but with an honest cowman who may keep the key in his pocket, that is surely an easy matter. For the first two years, until the border Vines bear, the house will be supplied with pot Vines. *Llandilo.*

Garden Walks.—It appears to me that both Mr. Baily and yourself recommend that walks should be made higher than the adjacent ground. Mr. Baily tells us that their outline ought to be clearly and distinctly defined, but I confess that I am puzzled to know how a clear outline (which I take to mean edging) can be maintained where the gravel is higher than the turf or border ; such a walk may have its advantages, and be useful enough, but it must be very unsightly. When it is intended to make an entirely new walk through a Grass-plot or lawn, care should be taken to ascertain the nature of the ground through which it has to pass. A porous, sandy, or gravelly soil is in itself a walk almost half prepared, while a tenacious loam or clay requires quite a different kind of treatment. I find from experience that the formation of a good dry walk is, on clay, very uncertain, except a considerable amount of earth be excavated. I go further than some who think that digging out a sort of canal-looking trough and filling it up again with stones is sufficient. My walks are made and drained on a regular plan, as the annexed sketches will show. Some recommend a bed of concrete or asphalte to be placed 2 or 3 inches below the intended surface level, covering thickly with good gravel. I have no experience of this plan. I have often seen an old hard-worn walk coated over with new gravel, but the old and new material never properly united, and the result was anything but satisfactory. The concrete will certainly prevent water from sinking through it, and therefore a considerable time must elapse before it can reach the sides through the mass of gravel ; and it is expensive. Walks may be made so as to throw all the water off to their sides without being rounded too much, which would be unsightly ; but I have come to the conclusion that it is better to allow the wet to percolate through as quickly as possible and then dispose of it by one or more drains below the foundation, taking care in removing the earth to have the bottom sloping towards the centre, as in fig. 1. I dig the middle about a foot deeper, and

Fig. 1.

put down a 2-inch drain tile ; continuing it down the centre of the walk, and leading it out to some land drain, or other outlet, as the case may be. Where the walk is broad, say 12 or 14 feet, and the ground clayey or wet, it is advisable to put in two drains ; or in an open

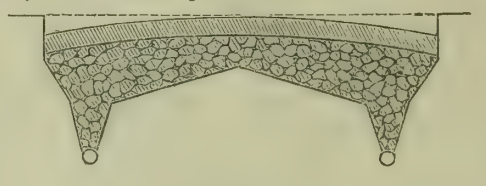

Fig. 2.

area or parade I have put in a great number, often ranging not more than 6 or 8 feet apart ; but in all cases I would advise the ground, *i. e.* the bottom of the excavated portion, to be sloped to the drain, as represented in Figs. 1 and 2, and as the whole need not be deep, it would be better to fill all above the drain-tiles with loose stones, brick-bats, or similar substances, in order to ensure a quick drainage for the water which falls on the walk. To facilitate the latter object, where the walk leads along a perfect level, let the tile drain dip or fall to the places you have arranged for its discharge ; and to ensure efficiency these had better not be too far apart. It is not necessary to make a walk constructed in this manner very deep. I have made many not more than 8 or 10 inches in the deepest part, and only half that in other places ; but where the grounds are in the course of alteration, it often happens that abundance of rough stones can be obtained, which are difficult otherwise to get rid of ; in such a case you may make it as deep as you please. Where it is possible to choose the material on which to make or lay the foundation, there is nothing better than brick-bats or rough stones from an old building, to which a considerable portion of mortar attaches. Worms, which are great enemies to a well kept walk, dislike lime ; clinkers, or the refuse lumps from an iron foundry, glass or chemical works, are also very good; but if such things cannot be had, scatter some lime amongst the stones which form the foundation. Salt will also do for a time, but the best foundation is to be obtained from old buildings. *S. N. V.*

Pipes for Conveying Water.—I apprehend that "Dodman," p. 181, would find common clay pipes of the kind denominated "Spigot and Faucet," the most economical for his purpose. They are made of various sizes, from 3 inches up to 12 inches in diameter, and are extensively used in this part of the country, for carrying off sewage water from dwelling houses, leading water for mill dams, and also for distributing liquid manure, and various other purposes. The size I would recommend, as being sufficiently large for "Dodman's" intended purpose, is 3 inches in diameter. They may be placed from 2 to 3 feet below the surface, and if properly jointed with cement, and the soil firmly pressed round them, will be found to answer every purpose required of them. If thought requisite they may be glazed both inside and out, but I am of opinion that if they are glazed in the inside only, it is all that is requisite. The cost of the 3 inch diameter is 6*d.* per yard ; if glazed inside 8*d.*, and glazed on both sides 11*d.* per yard. The prices I have given are those charged at a distance of from 70 to 80 miles from the works. I am unacquainted with the prices in the neighbourhood of London. *T. D. Wishaw, Lanarkshire.*

Planting Potatoes.—I have again carried out this year the plan of early planting, having already put in upwards of 300 acres. It having been stated last year that deep planting was highly desirable, I put in a few as deeply as 14 inches, and the produce was by far the finest, and freest from disease, of any I grew. This year I shall institute a series of experiments to test this plan fully, commencing at 4 inches deep, and going down to 14 inches. I was also, in one instance, very successful in pursuing the plan of laying down the tops, and covering up with earth. The produce was entirely free from disease, whilst others, treated differently, alongside of these, were as much affected as usual. I found the Breadfruit much more diseased than any other sort, especially a small plot from seed I had given me, they being half bad. *John Fryer, jun., Chatteris, March* 23.

Does Chloride of Lime impair the Colours of Flowers?—One of my Camellias, which has hitherto produced bright crimson flowers, is this year changed to a pale blush streaked with red. My gardener, when taking them into the greenhouse in the autumn, watered the surface of the earth in the pots with diluted chloride of lime, to extract worms, &c. Can this have caused the change in the colour of the flowers? *Constant Reader.*

[Your gardener was a blockhead.]

Bees.—In "Y.'s" account (p. 165) of feeding at night, he says nothing about closing the door of the hive ; if open, the bees will sally out next day, attract others by their sound, and in that way their hives will be more likely to be attacked than if the food had been placed abroad. Besides, the nights are often too cold for bees to descend and leave their brood uncovered. As they seldom or never frequent water during the spring months, why does "Y." recommend giving salt water in pans and withdrawing it in May—the very time in which bee-keepers begin to expect to see them at putrid water. *A Peebles Bee-keeper.*

Killing Rats.—Have any of your correspondents tried to chloroform them, and with what success? I am confident that chloroform if rightly applied will kill them. *A Reader.*

Winter-felled Larch.—I have used Larch much for gates and rails, and found it answer well, and warp very little, though used immediately after it had been felled. I always cut in winter, with the bark on. *J. W. H.*

[To be sure.]

Peas.—The searching, testing inquiry about our variations of Peas, and other vegetables, will, in the end, be productive of much good. The self-same kind is constantly put before the public under a new name, till purchasers begin to ask themselves "What's in a name?" By placing these side by side with our old acquaintances, under like conditions, as has been done at the gardens of the Society, the truth is revealed ; and scores of sorts which figure in the seed catalogues, and joy in the names of the Smiths and Joneses, the Browns and Robinsons—Imperial, Royal, Matchless, *cum multis aliis*—are proved identical, let them have come from whom they may, and whether the name attached has been affixed by the vendor or by the purchaser. But John Bull, and especially that section who "are very fond of gardening," delights in running after a Will o' the Wisp ; and no sooner has he chased one down, and proved it airy nothing, than he is ready for a new race, to end in like disappointment. Novelty, I have been told, is the life of trade ; but novelty of this kind, so to speak, ought to be its death. My object, however, in writing was to say a word or two on the variations of Peas. And first, let me give you my pretensions to pass an opinion upon the matter, that, with your readers (to whom I am unknown), I may stand in a fair position. Be it known, then, that 40 years ago, my father, of good memory, employed my then young eyes to detect the differences of the Peas he intended for seed, and many a patient hour was devoted to this most necessary operation under his guidance. It was at this school, then, that I learned to detect the difference between Charlton and Frame Peas, between Blue Prussian and Imperial, &c. Be assured, then, that Early Charlton is not identical with Early Frame—that gardeners would complain, and justly, if one of the former was found in a row of the latter ; for the Charlton overtops all kinds of Frames, produces its pods later, and lasts picking longer, frequently even after the Frame has withered. Some will say that there is an advantage in all this ; but no, all that we want with a round white Pea is its property of yielding its crop earlier than those of finer flavour, as the varieties of Marrows, Blues, &c. And as we have now kinds that will be in pod *pari passu* with the old Charlton, it is no longer a desideratum. The blue Prussian is undoubtedly the parent of all the Sabre Blues, blue Imperials, and the like. In my early days we had only Prussian Blues, and they were prone to run into a white variety, which, however, had the peculiar glaucous habit of the variety they sprung from when in growth. Soon after the blue Imperial appeared, and was distinguished by the greater breadth of its pod and larger size of the seed ; its shape also differed, the Prussian being by far the rounder. This, the Imperial, has always had a tendency to revert to its original, and, without care, a good stock would soon become half mixed with the kind it sprung from. This occurs in this manner : The last Pea in the pod is frequently much smaller than the rest—the little Anthony of the team. If these are carefully collected and sown separately, very many more, in proportion, will revert to their origin, than those taken from the other part of the pod. But now there is yet another, to which my name has been not *un*courteously attached in your "Notices to Correspondents," that requires a word or two. I allude to the Sabre or Scimetar Blue, which I find myself given as authority for its being identical with the blue Imperial. How this occurred I know not ; but certain it is that there is a clear distinction between them. The pod of the Sabre is gracefully curved ; it is also more rounding, and contains more Peas in the pod than the Imperial. A poor soil, however, has the effect of reducing this variety to a Prussian more quickly even than the Imperial. If I might, without offence, offer a word of advice on the matter, it would be—to my fellow seedsmen, not to be too eager to rush to print with a new name ; and to my customers, not to be so hasty in purchasing novelties, but wait the time till their worth has been acknowledged. *William Masters, Exotic Nursery, Canterbury.*——In some of your recent leading articles you appear to us to have charged the seed trade with multiplying names of Peas and other vegetables for unworthy purposes, and this upon the authority of an anonymous correspondent who has sheltered

himself under the initials "R. T." Press of business has hitherto prevented us from having taken notice of the innumerable blunders that he has made in his classifications, and were we to notice the whole of them we should fill the whole of your Paper. We will, however, endeavour to correct some of the most prominent. We are the more induced to do so as you have, in your last publication, in answer to a correspondent, said: "The seeds having been obtained from highly respectable authorities, the synonymes were admitted." We would ask what man of common sense who knows a Pea-pod when he sees it, could for a moment say that the dwarf blue Imperial and the blue Sabre or Scimitar, or more properly Cimeter, are synonymous? They are as dissimilar as the Charlton and your favourite Auvergne, or perhaps more so. Now for "R. T." We will begin with his list of White Peas, which require sticks. No. 1, § 1: Here he has confounded single blossomed Peas (that is, Peas having only one blossom, and consequently only one pod on each side of the joints of the haulm), double blossomed (that is, Peas having two blossoms, &c.) early, and late, in one heterogeneous mass as Frame Peas. Some of the names are unknown to us; many of the others, such as Superfine Early, Early Nicholas, Perkin's Frame, are all but obsolete, and are retained in some of our lists because still ordered by some of our correspondents, but which are now considered third or fourth-rate Peas. 2: Prince Albert, a variety of the preceding, ripening about 10 days earlier. The Early Kent is very similar to this, as is also Warner's Early Emperor. In this comparison "R. T." has shown great want of knowledge of his subject. Prince Albert is a single blossomed Pea, being a selection from the Early Kent, and being two or three days earlier, but bearing no resemblance to the Emperor beyond the fact that they are both white Peas. The Emperor is double blossomed, as early as Prince Albert, a heavy cropper, with very large pods; its merits are well known. 3. Charltons: Amongst the aliases in this category are placed as early Peas, *Late* Dwarf, and Twesley Dwarf, which we suppose to be Tewsley Dwarf; if so, it is a late Pea, and very properly placed in No. 11, it being an old synonyme of the White Prussian. Many of the names in this list are also obsolete. 5. Early Hero, not known to us, but if it is as late as Auvergne, it surely can have no right to the prefix of early. No. 1, § 2.—8. In this number are also several blunders. "R. T." has confounded the old Spanish Dwarf, or Dwarf Fan, with the Early Spanish Dwarf, two distinct varieties, the latter being longer in the haulm, and earlier than the other. He also says that these and Bishop's Dwarf, which resemble each other, are inferior to the Early Dwarf, aliàs Nain hâtif Lévégue, mentioned at the beginning of this paragraph. In this he has shown want of knowledge of the French language, for he has evidently mistaken Lévégue for L'évêque, which is the mode by which the French translate Mr. Bishop's name. If our conjecture is correct, we do not see how Bishop's Dwarf can be inferior to Nain hâtif Lévégue, which are identical. 11. The White Prussian, with its aliàses, is quite distinct from the Royal Dwarf, this having much larger pods and larger seeds when ripe, neither of them exceeding 3 feet in height. Beans: Green Windsor, aliàs Toker; this mistake is worse than the others, the latter having white seed, the former green, also differing in shape. Were we not afraid of trespassing too much upon your space, we could give you the origin of many of the synonymes, and the reasons why they are retained in the lists of many of the most respectable houses in the trade. *Beck, Henderson, and Co., Middle Wharf, Adelphi.*

Societies.

Botanical, of Edinburgh, *March* 14.—The President in the chair. Several donations were announced. Dr. M'Donald exhibited a leaf of Phormium tenax, grown in Argyleshire. The leaf was 6 feet 3 inches long and 5½ inches broad. He stated that the plant thrives well in that part of Scotland, without any protection during winter. He also mentioned that in many places on the Mull of Cantyre, Myrtles, Hydrangeas, Fuchsias, and other delicate plants, succeed admirably, without protection.—Specimens of plants from Simla were exhibited from Lieut. R. Maclagan, Bengal Engineers. Simla is in lat. 31° 6′ N.; long. 77° 13′ 22″ E. Altitude 7040 feet.

Dr. Balfour read descriptions of Sabal umbraculifera, a Palm now in fruit in the Botanic Garden, and of Phœnix sylvestris, another Palm which is flowering at present in the same garden.—Dr. Maclagan made the following remarks regarding some articles of the vegetable materia medica. *Prunus virginiana.*—Under this name, borrowed from the United States' Pharmacopœia, a bark has, during the last year or so, been employed in considerable quantity in this country as a medicine, and has found favour with several medical men. This, it is presumed, is the bark which is officinal in the United States, and which, though bearing in the Pharmacopœia, U.S., the pharmacological designation of Prunus virginiana, is not the bark of the plant which was so named by Linnæus. *Triosteum perfoliatum, Linn.*—The bark of the root of this is cathartic, and in large doses emetic, and as such is employed in America under the name of Fever-root. *Phytolacca decandra, Willd.*—Poke-weed. The root and berries are emeto-cathartic, and somewhat narcotic, and have been used in America in chronic rheumatism. In many of its actions it appears to resemble Mezereon. *Eupatorium perfoliatum, Linn.*—Thorough-wort. The leaves are esteemed tonic and diaphoretic, and have been used with success in intermittent fever. It appears from the statements of Wood and Bache to have arrested intermittent fevers, chiefly by acting as an emetic, and can hardly be looked upon as possessing the properties of an anti-periodic. *Arisæma atrorubens, Blume; Arum triphyllum Willd.*—Indian Turnip. The recent root of this is extremely acrid, but when dried becomes bland, and yields its starch readily, quite white and pure. The half-dried root has been used as a stimulant expectorant in chronic catarrh, and when mixed with sugar, as a stimulant application to sore mouths in children. The starch of this resembles under the microscope that of Arum maculatum, being in small grains of a rounded form, but frequently presenting a somewhat angular aspect. *Podophyllum peltatum, Linn.*—May Apple or Mandrake. The root is an effective purgative, acting very like jalap, and applied to the same class of cases in which that drug is used. The leaves have the character of being somewhat narcotic, but the fruit, which is sometimes called Wild-lemon, is eaten with impunity.—Mr. M'Nab read the following list of plants as they appeared in flower in the open borders of the Royal Botanic Garden, Edinburgh, from 15th February till 14th March, 1850.

Feb. 15.	Hepatica triloba, varieties.
,, 16.	Crocus Susianus (Cloth of Gold).
,, ,,	Corylus avellana
,, 18.	Leucoium vernum
,, ,,	Symplocarpus fœtidus
,, ,,	Viola odorata
,, 20.	Capsella Bursa-pastoris
,, 21.	Arabis albida
,, ,,	Bellis perennis
,, ,,	Lamium purpureum
,, 22.	Daphne Mezereon
,, ,,	Knappia agrostidea
,, 23.	Primula denticulata
,, ,,	Vinca major
,, 24.	Petasites vulgaris
,, 25.	Daphne Laureola
,, ,,	Dondia Epipactis
,, ,,	Potentilla Fragariastrum
,, 26.	Crocus sulphureus, and other garden vars.
,, 27.	Tussilago Farfara
,, 28.	Nordmannia cordifolia
March 1.	Hyoscyamus Scopolia
March 1.	Primula nivalis
,, 2.	Doronicum caucasicum
,, ,,	Tussilago nivea
,, 4.	Narcissus pumila
,, 5.	Anemone pulsatilla
,, 7.	Asarum europæum
,, 8.	Omphalodes verna
,, 9.	Iberis sempervirens
,, 11.	Cardamine hirsuta
,, ,,	Erythronium Dens-Canis
,, ,,	Scilla bifolia alba
,, ,,	Do. cærulea (13th March)
,, ,,	Pulmonaria mollis
,, ,,	Vinca major
,, 12.	Tussilago alba
,, ,,	Sisyrinchium grandiflorum
,, 13.	Hyoscyamus physaloides
,, ,,	Cheiranthus Cheiri
,, 14.	Draba aizoides
,, ,,	Aponogeton distachyon (in open-air pond)
,, ,,	Symphytum caucasicum
,, ,,	Ribes sanguineum

Mr. Evans stated that he had made similar observations on the flowering of plants in the Experimental Garden. In a warm situation Sisyrinchium grandiflorum and Primula denticulata were in flower on 19th February. Bellis perennis flowered on 25th February and the Apricot on 1st March.—Five new Fellows were elected.

Reviews.

Counsel to Inventors of Improvements in the Useful Arts. By T. Turner. London: Elsworth. 12mo, pp. 101.

The aim of the author of the present little work is, he tells us, "1st, to offer some suggestions as to the cultivation of the fields of useful invention, and the settlement of new tracts of its territory; and, 2dly, to exhibit the inventor's legal position in the general features of its privileges and conditions, leaving its forms and minutiæ to be dealt with when the special circumstances arrive." The author has consequently divided his book into two parts corresponding to this two-fold division of his subject. The second part contains some useful information, and may be perused with advantage by those who, in the words of the author, are at once denoted and reproached by the word projectors.

Oceanus; or a Peaceful Progress o'er the unpathed Sea. By Mrs. D. Osborne. Longmans, square 8vo, is a dialogue, the object of which is to give children a taste for the study of geography, for which purpose several amusing stories are introduced, along with clever woodcuts.

The Unity of Nature. By the late J. W. Howell. 8vo, pp. 143. Jackson.

The object of the present work is to show the relation which exists between the different branches of natural science. "No attempt is made to prove anything new, or to aspire to the deeply scientific character of many larger works of a similar nature; but only to employ and arrange the numerous facts with which persons who possess even a moderate degree of acquaintance with the sciences are already familiar, and to exhibit their novel, and perhaps unexpected relations, in a manner somewhat similar to that by which we form numerous and beautiful landscapes by the repeated combinations of the same objects, which result from beholding them from different points of view."

With this intention the author considers the general relation of the sciences, and then the particular relations of Geometry to Astronomy, Mechanics to Astronomy, Optics to Astronomy, Astronomy to Geology, Botany to Geology, Optics to Geology, Botany to Animal Physiology, Physiology to Practical Religion, and Life to Organisation.

The "unity of Nature" is pointed out by the author in an easy and familiar style, and the work is worthy of being perused by those who think the world, with the various objects upon and around it, was made by chance.

Garden Memoranda.

John Warner's, Esq., Hoddesdon, Herts.—The grounds here lie on the two sides of a valley, whose hollow is occupied by a long irregular piece of water, at the upper end of which, near the house, is a fine fountain issuing from a piece of tasteful rockwork, surrounded by islands clothed with weeping and other trees. The house is conspicuously placed on a commanding eminence at the N.E. corner of the grounds, overlooking a varied and rather extensive lawn, the water, and the rising ground on the opposite side of the valley. It has a neat conservatory attached to it, furnished with a fountain and gay with spring bulbs, Roses, and other early flowering plants. Immediately in front of it is a small rectangular flower-garden, cut off from the lawn by an evergreen hedge, and containing flower-beds in Grass, some nice ornamental shrubs, a long piece of rock-work, and terminating in the end farthest from the house in a range of glass houses, in the centre of which is a handsome Orangery. The latter, being lofty, and having a highly decorated architectural front, is a conspicuous and striking object. In this house were some large and beautiful Orange trees covered with handsome fruit in all stages of growth. Some of the trees were growing in slate tubs, painted ornamentally, and having a moulding round the top, which greatly improves their appearance. This range of houses stands about half way down the hill, between the dwelling-house and the Orchid-house, described last week. On the upper side of the latter are two long Vineries, the first one a late house, in which Mr. Williams grows his pot Ferns; and the second an early house, filled with Muscats, which were breaking strongly, and showing well for a good crop of fruit. A tan bed in the centre of this house offers convenience for striking cuttings in, and for starting some of the stove plants, as Allamandas, and things of that kind, into early growth. In front of these Vineries is a range of pits for wintering soft-wooded plants in. The glass of these is covered in severe weather with asphalte shutters, which are found to make cleaner and more effective protecting material than mats. A small piece of fruit garden along the canal or water-side carries us out to the lawn, which is embellished with a neat fountain, and some fine specimens of shrubs and ornamental trees. Among the latter was a spreading Cedar of Lebanon, measuring more than 2 feet through the bole, though only turned out of an 8-inch pot 28 or 29 years ago. So much for the rapidity of growth of this kind of Cedar. Pursuing our way by a little bridge across the lake or "canal," we reach the "bath garden," where, by the side of the bath house, a water-wheel, turned by a stream led through a small pipe from the upper ground, throws the water up to the top of the dwelling-house, and supplies the fountains in its vicinity. Shady walks through a belt of plantation lead to the springs from whence this water is obtained. These rise out of romantic dells near the top of the hill, decorated with rockwork, fragments of ancient building, and planted with the various kinds of British Ferns, whose culture Mr. Williams perfectly understands. Following the belt of plantation which encompasses two ample Grass fields, we now descend the hill, pass through a little Pinetum, enter what is called the "Dahlia garden" noticed at p. 7, recross the canal, and now we are on a fine raised terrace walk which leads to and is on a level with the mansion. Such is a cursory account of the general features of this interesting place, which is every year assuming a more highly decorated character, and for which it has great capabilities. Those who wish to make themselves more conversant with details, will find a good description of this garden at p. 7 of the present year's volume.

Miscellaneous.

Time of Flowering of Certain Plants, at Gratz, during the Last Five Years.

Dr. Marco.

Calendar of Operations.

(For the ensuing week.)

FORCING DEPARTMENT.

Vineries.—Attend regularly to stopping and tying the shoots and thinning the berries. In regulating the bunches, it is well to consider whether a few very large ones will or will not be more desirable than a greater number of smaller bunches. Gardeners usually find those of a moderate size, averaging little more than a pound in weight, more generally useful than very large ones, from the greater facility with which they may be set on the dessert dishes. For this reason, the long, diffuse shoulders of very large shows should be removed; and the loss in the weight of individual bunches will be amply compensated for by the greater number of useful bunches, and the larger size of the berries. Examine the state of the inside borders as regards moisture; and in this do not be satisfied with the appearance of the surface, which is frequently kept moist by syringing, but examine the soil 10 or 12 inches lower down. If any water is necessary, use manure-water at 80°. If the border has become rather dry, the impulse given by this will be immediately visible in the vigorous and rapid expansion of shoots and leaves. Peach-houses.—Take care that the inside borders do not get too dry, but supply them with liquid manure as often as the state of the soil requires it, previously loosening the surface, that the water may penetrate all parts of the border equally. The period between the setting and the stoning of the fruit is a critical one, and during that time they should not be hurried forward by undue excitement, or they are very liable to cast their fruit: but after this stage is securely passed, they

will stand almost as much heat as a Pine. They delight in a high humid atmosphere, if accompanied with abundant ventilation. CHERRIES AND APRICOTS.—Where fruit is swelling maintain a night temperature of about 55°. Give abundance of air, and on fine afternoons close at 80°, and syringe immediately with clean water. These fruits require to be forced very gradually, and a high night temperature should be carefully avoided.

FLOWER GARDEN AND SHRUBBERIES.

Finish planting out biennials and perennials from reserve-garden, and dividing large batches of herbaceous plants. Plants of these kinds, including Hollyhocks, Delphiniums, &c., must be carefully guarded against the attacks of snails, by forming a ring of soot and lime round the plants, and scattering a little over the surface of the soil. The decaying remains of last year's stems should also be removed, and the soil neatly levelled round them, to destroy any lurking places which the enemy may have about the crowns of the plants. The Hollyhock is now becoming a general favourite in the flower-garden, owing to the pains which florists have lately taken to improve upon the old common varieties. To grow them in perfection, a deep rich soil is necessary; and if the ground about the old plants does not answer to this description, let it be improved by forking in some well-rotted dung; and, during the growing season, let the plants have frequent waterings of liquid manure. Borders of mixed herbaceous plants are very appropriate and beautiful in certain situations, if tastefully arranged as regards height and habit of growth, colour, and season of flowering; owing to a want of attention to these particulars, beds of this kind are considered dull and uninteresting. The arrangement of the plants cannot be rectified during the season of growth, nor yet during the season of rest, unless some means be adopted of distinguishing them when they are in a dormant state. They should be correctly named as they come into flower, and memoranda taken of their height, colour, season, and other peculiarities, that, with the assistance of this information, they may be systematically arranged when the proper season for moving them arrives.

FLORISTS' FLOWERS.

The prevalence of north-easterly winds, accompanied with severe frost, has been a serious drawback on vegetation, and unless Tulips have been well protected they must have suffered severely. We hope, however, our cautions have been fully carried out; if so, but little harm will ensue. As for Carnations and Picotees, the sooner they are planted in the pots in which they are to flower the better. We like early potting, and if the plants have been well hardened, no extra shelter will now be required. Auriculas and Polyanthuses in frames will now be starting, and as this is a most critical period, much care will be requisite. We fear that during the few past frosty nights, unless the frames were well covered, much injury would result; at all events, this attention must be carefully seen to. Water may, when the weather is fine, be given copiously (when moisture is requisite); but we would by no means recommend frequent and slight attention in this particular; when water is given let the ball of soil be thoroughly saturated. Dahlias, Pinks, and Pansies may be attended to, as in our previous Calendars. In 10 days we shall have something more to say on these favourites.

KITCHEN GARDEN.

Young seeds of the Brassica family should be carefully guarded against the depredations of birds, by covering them with netting, and from the attacks of slugs by sprinkling a little lime and soot amongst them. Tomatoes and Capsicums should be sown in heat and potted off, three plants in a 4-inch pot, in a rich loamy soil, as soon as the young plants will bear handling.

State of the Weather near London, for the week ending March 28, 1850, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 3d in 1848—therm. 78 deg.; and the lowest on the 1st, 1833—therm. 16 deg.

Notices to Correspondents.

AMERICAN BLIGHT: *C H.* Destroy it by means of spirits of tar applied with a common painter's brush.‡

AZALEAS: *Sub.* Assist them to make their wood early in the season, by placing them in heat when they begin to show signs of growth. Keep them in a growing heat till their young shoots have attained their full size; then harden them off, by gradually decreasing the temperature, and finally place them out of doors, in order that their wood may be thoroughly ripened early in autumn, and their flower-buds set. Under this treatment, if their roots are in good condition, they will flower with you the following year.‡

BEES: *Old Sub.* A cup or glass should always be put on as soon as the swarm is off, and if this has occurred in June, will, even in moderate seasons, be filled and sealed in time (about the middle of July) to place a second one on; but this second one should not be removed in the middle of August, the proper time, unless the weight in the hands of the stock leads you to think that the bees have stored a sufficient quantity for the autumn and spring consumption. It is better to preserve this second one till late in the autumn, for should September or October prove very wet and unfavourable, you will benefit the stock more by replacing the second cup or glass than by artificial food. On a swarm which has been hived in June or early in July, it is proper to place a cap or glass, and you will have it filled shortly after the one placed on the stock hive, and in time for a second one, which also preserve for the same purpose as that from the stock hive. But to assist the bees in making comb, it is advisable immediately after the swarm is moved to its permanent place to put a feeder on with a syrup of sugar, as directed in artificial feeding at page 165; but this is to be made of 2 lbs. loaf sugar, dissolved in a pint of water, boiled up briskly, removing the scum as it rises; when cold to be bottled for use. The feeder should be replenished for three or four days, then removed, and the cup or glass placed in its stead. This management will not in the least weaken the stock, but otherwise, as it gives more room for breeding. *Y.*

BLACK BARBAROSSA GRAPE: *Sub.* The bunches grow to a great size. One exhibited at a late meeting of the Horticultural Society weighed 4 lbs. 13 oz. It is middling well flavoured; but its chief merit consists in its hanging late, keeping plump and good, even almost up to the present time.‡

BOOKS: *Lutonian.* The best general introduction to entomology is Kirby and Spence's "Introduction," 4 vols. 8vo; that on the families is Westwood's "Introduction," 2 vols. 8vo; that on the British genera, Curtis's "British Entomology;" that on the species of beetles, Stephens's "Manual of British Beetles;" that on butterflies and moths, by Humphreys and Westwood; and those for beginners, are Newman's "Grammar" and Westwood's "Entomologist's Text-book." *W.*—*An Irish Sub.* There is no such book. "Paxton's Botanical Dictionary" and "Sweet's Cultivator" are the nearest to what you want.

BROWN'S FUMIGATOR: *R E.* We have not yet tried this sufficiently, but it seems to be a very nice useful instrument. As soon as we have given it a proper trial, we shall report further upon it.

CAMELLIAS: *A Constant Reader.* Do you think that these are stove plants, that you treat them in the manner that you describe? The wonder is that you have not killed them outright. Your temperature is 20° too high.

DEODARS: *Cambro Britannicus.* Never stake the young drooping shoot; it will stiffen in time from its own unaided efforts. If there is a double leader, then pinch the end off the worst, so as to allow the other to go a-head, and do no more to the top. Mind that the roots do not remain cork-screwed when the young plants are put out.

DRAINS: *W R M.* The roots are not from any aquatic plant, but from something that grows near your drains. Roots are so much alike that they cannot be distinguished; those of all plants will choke drains—Carrots are quite as likely as Mangold. If we were on the spot we would engage to discover your enemy, but at this distance it is impossible. Cannot you trace them back? What is growing rankest near the drains? That would be suspicious. Are there no trees, or Thistles, or Docks, or coarse rank Grass? In other words, is the land *clean?* We venture to ask this, because we have sometimes thought that Irishmen really must grow Thistles as a field crop.

GESNERA ZEBRINA: *I O P.* Place those in a dormant state in gentle heat; keep the plant which appears to have flowered lately on a cool shelf near the glass, and let it remain dry until it shows signs of growth. Then encourage it to grow, by giving it more heat, and watering it when it requires it.‡

HEATING: *P P.* One of Rogers's conical boilers will heat a hothouse and Melon pit standing near each other, but in opposite directions, provided the house and pit are not very large. You do not mention their size.‡

INSECTS: *P D.* The beetle which has scooped out the pith of the shoots of the two-year-old Scotch Firs is the Hylurgus

piniperda, described in the *Gardeners' Chronicle* for 1846, p. 740. Fig. 1 is a shoot with the burrow shown at the bottom; 2, ditto opened; 3, the beetle of the natural size; 4, ditto magnified; *e, e, f, g, g*, parts of its mouth. The diseased shoots should be cut off and burned before the females deposit their eggs. *W.*—*W B B.* The winged cockroach sent seems to be of a different species from the small wingless specimens sent before. It seems identical with a species we have received from New Holland, and we think it is a female and not a male. *W.*—*J S H.* We should be glad to see the two species of cockroach from Messrs. Loddiges' Orchid-house. We have no doubt that there are numerous species with the same habits, and only hope that the Orchid growers will not let them gain a head, as has been the case with the common cockroach imported from the East, and the larger species from America, now becoming much more common than formerly. *W.*—*Sub.* The brown cases like bits of cigar formed on Whitethorn hedges are the cocoons of the large sawfly (Trichiosoma lucorum), which we shall shortly illustrate in our series of entomological articles. *W.*

JUNIPERUS EXCELSA: *C R D.* It will stand the winter and thrive near London, where Cupressus sempervirens and torulosa do well.‡

NAMES OF PLANTS: *H D.* Senecio Petasites.—*Addio.* We don't know.—*P J N.* Erythronium Dens Canis, the Dog's-tooth Violet.—*S B.* Cornus Mas.—*Zouch.* Campanula hybrida.—*J Ellis.* Erica versicolor, Dendrobium excisum.—*Cymro.* Salvia pseudo-coccinea.—*G M.* Is it not a starved state of Cochlearia anglica? Its oval silicles refer it to that species, and not to grönlandica, which it a good deal resembles.—*Anon.* A Gonolobus, and apparently G. diadematus.—*P B.* 1. Schomburgkia undulata, a beautiful Dendrobe, quite new; can you not send us it, or a sketch of it, for publication in Paxton's Flower Garden? It is a charming thing; where from?—*T D, Pembroke.* 1, Acacia macradenia; 2, A. decipiens.

RUELLIA MACULATA: *J L.* We believe this to be Strobilanthes maculata. You probably do not give it heat and light enough when growing. Try this plan; put it in the stove close to the light, when it is beginning to grow, choosing a well ventilated place; give it plenty of water, and keep it growing as strong as you can; a little weak guano water twice in the course of the first six weeks will do it good. When it has made its wood place it in a dry greenhouse to rest. Then start it in the next season, as before, and it will probably flower.

SEEDS: *Keswick.* We print some letters on this subject, and shall return to it as soon as we have time. In the meanwhile, the quality of some of the criticism which has been offered may be judged of without our assistance. What is to be said of differences!! about which seedsmen themselves cannot agree?

THE SNOWFLAKE: *G S V.* The Vernal Snowflake, Leucoium vernum, of which the following is a representation, is a rare

bulbous plant, perfectly hardy, but impatient of wet in winter. You will see that it is totally different from a Snowdrop, and much prettier; the Snowdrop has three long sepals and three short petals; the Snowflake has sepals and petals of the same length, collected into a bell.

THE WEATHER: *A B.* You are lucky—as you will see by examining our weather register. We have had near London a temperature of 14°, and 4 inches of snow in some places.

TIMBER: *J W H.* The timber of Abies Douglasii is among the finest of all kinds of deal. We have now before us a plank an inch thick, almost as hard as Yew, which has stood in a warm dry room for 24 years without warping or splitting, or being in any way affected. The statement that you have received is the reverse of the fact in all the districts watered by the Columbia River.

WALLS: *L L.* On no account use coal tar upon your walls, at least at this season. Many a fine tree has been killed by its vapour. If applied at all it should be late in the autumn, when the walls are quite dry, and the trees are sinking to rest. Then the fumes from it will have been dissipated before the trees bud in the succeeding spring.

WALKS: *A Man in daily practice* may be a "*practical*" person, but he is not a very intelligent one. Like many other men, he persuades himself that what he has never tried cannot answer; and then when he is told that it does answer, he, with the civility belonging to his breed, is satisfied with giving the statement a flat contradiction.

WEEPING ASH: *North Briton.* It will not injure a Weeping Ash, grafted last year, to allow Scarlet Runners to entwine themselves round the stems, which look naked, for a year or two. We would rather be the Ash than the Runners.

WINTER SALAD: *P Q.* We shall not lose sight of this question; and we confidently look for much information from our correspondents. Mache, is Lamb's Lettuce; *Mache d'Italie* is, we believe, *Valerianella carinata.* Sprue Grass is the small Asparagus, too slender to be used at table, except when cut to pieces. The two best public collections of Orchids are at the Horticultural Society's Garden, and at Kew. We cannot with any propriety give you an answer to the same inquiry respecting *private* collections. That mode of heating answers perfectly with some, and fails with others; for the same reason, apparently, as belongs to Arnott's stoves, and the opposite opinions entertained about them.

MISC: *Sub.* Orange trees and Camellias will succeed perfectly in a well drained conservatory bed 2½ feet deep, made with peat, leaf mould, and sandy loam. It is just the place for them. A visit to the nearest large conservatory will give you a better idea of the kind of arrangement to be followed, and the plants most suitable for your large houses, than we can furnish you with. What do you mean by New Zealand Flags?‡—*A Sub.* Ferula communis is a hardy herbaceous plant, requiring no other care than room enough to grow in, and a warm thoroughly drained soil, more light than heavy. Cupressus sempervirens is the common evergreen Cypress, an evergreen tree too tender for any climate north of Kent, except some warm places on the western coast.—*H G.* We cannot advise you better than you have been doing. Pigeon dung is a powerful manure, and is best mixed with something of a less stimulating character.‡—*E S.* Shake the sulphur on your mildewed Roses out of an old tin pepper-box, if you have one. Syringe the plants first, that it may adhere to the leaves. The Cloth of Gold being a strong growing Rose, should not be too highly manured. For the treatment of Azaleas see next column. Mandevilla suaveolens succeeds best planted out in the border of a greenhouse, and trained up the rafter. For directions about watering, see "Villa Gardening," in another page. ‡—*Ravenswood.* Veronica speciosa is not hardy. It will succeed in almost any kind of soil. Ranunculuses may be benefited by watering them with *weak* guano water when they are in bloom; but it should not be done oftener than once a week at most.‡

SEEDLING FLOWERS.

CINERARIAS: *L.* A nice bright-coloured variety, but much too small.*

GLASS FOR CONSERVATORIES.

JAMES PHILLIPS AND Co. have the pleasure to hand their New List of Prices of GLASS for Cash.

CUT TO SIZE.	SHEET SQUARES.
16 oz. from 2d. to 3½d. per foot.	In boxes of 100 feet. s. d.
21 „ 3½ „ 5 „	Under ... ... 6 by 4...12 6
26 „ 3½ „ 7½ „	6 by 4 and under 7 by 5...16 6

Glass Shades; Tiles and Slates of any size; Wasp Traps, 3s. 6d. per dozen; Lamp Shades; Rough Plate Glass of every thickness. Lactometers, for trying the quality of milk, 4 tubes, 7s. 6d.; 6 do., 10s. Glass Stands for Pianoforte, and every article in the trade.

JAMES PHILLIPS AND Co., 116, BISHOPSGATE-STREET WITHOUT, LONDON.

HARTLEY'S PATENT ROUGH PLATE GLASS FOR CONSERVATORIES, &c.

See Article in THE GARDENERS' CHRONICLE of Saturday, December 8, 1849.

"Continued experience leaves us no room to doubt that this is the best material yet produced, and that it will in time supersede glass of all other kinds for the greater part of Gardening purposes." . . . "As for the article substituted for Rough Plate . . . it is wholly unfit for any horticultural purpose." . . . "The best sample of it which we have yet seen was Manufactured by Messrs. HARTLEYS, AND SOLD BY MESSRS. JAMES PHILLIPS & CO., 116, BISHOPSGATE STREET."

CROWN, SHEET, AND ROUGH PLATE GLASS, FOR HOTHOUSES, CONSERVATORIES, &c.

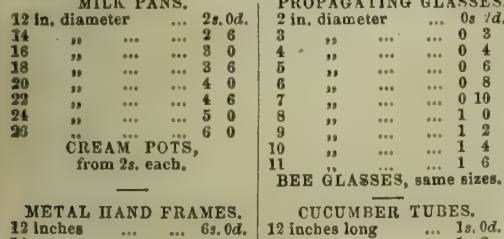
Of every manufacture FIT FOR USE, including the make of Messrs. CHANCE, HARTLEY, SWINBURNE, and others.

100 and 200 feet cases of large Sheet Glass, from 2½d. per foot. Small ditto, 10s. 6d. per 100 feet, packed in boxes ready for immediate delivery. Curators of Botanical Societies, Florists, Railway Agents, and others requiring large quantities, will, on sending dimensions, receive estimates at the lowest prices.

GLASS MILK PANS, CREAM POTS, Lactometers, Bee Glasses, Fish Globes, and all kinds of Dairy Glass, Propagating Glasses, Hyacinth Dishes, Cucumber Tubes, and every other description of Garden Glasses.

PATENT GLASS PENS, self supplying, never blot, never soil the ruler, and will write continuously for 12 hours.

Also, Glass Rulers, Glass Inks for office-stands, desks, &c. Stationers and Schools supplied. Wholesale Warehouse for Ornamental Shades, Lamp Shades, Gas Glasses, Genuine White Lead, Paints, Colours, and Pumps for Farm purposes.



Our Catalogue of 18 folios is the most complete ever published. No Gardener or Farm Bailiff should be without one. May be had Gratis on sending two postage stamps to Messrs. COGAN and Co., 48, Leicester-square, London.

GLASS FOR CONSERVATORIES, &c.

HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2d. to 3d. per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

GLASS FOR CONSERVATORIES, HORTICULTURAL PURPOSES, &c.

T. MILLINGTON'S SHEET GLASS, which is of the best description, varying from 16 to 32 ounces, at from 2d. per foot and upwards; 100 feet and 200 feet cases of large Sheet Glass, for cutting up, at 2½d. per foot. British Plate Glass, from 1s. 2d. to 2s. per foot, according to size. Patent Rough Plate Glass, from ¼ to 1 inch in thickness, from 4d. per foot upwards. Glass Slates and Tiles. Milk Pans from 12 to 24 inches diameter, from 2s. to 5s. each. Cucumber Tubes, from 12 to 24 inches long, at 1d. per inch. Lactometers, 7s. 6d. each. Wasp Traps.—Lists may be had, on application at the Warehouse, 87, Bishopsgate-street Without, same side as the Eastern Counties Railway.

BEE HIVES.

GEORGE NEIGHBOUR AND SON respectfully announce that they have prepared for this season an extensive supply of their various IMPROVED BEE HIVES, which are offered to all who are desirous of cultivating that pleasing and profitable branch of rural economy—the Honey Bee. The collection consists of "Nutt's Collateral Hives," "The Single Box Hive," "The Amateur Bar Hive," "The Improved Cottage Hive," &c., from either of which the honey may be taken at any time without injury to the Bees, and may be worked with safety, humanity, and profit, by the most timid and unaccustomed to Bee manipulation. A descriptive paper, with drawings and prices, will be forwarded on the receipt of two postage stamps.—GEORGE NEIGHBOUR and SON, 127, High Holborn, London.

"Nutt on Bees" (6th edition), now published.

SUPERPHOSPHATE OF LIME, GUANO,

CRUSHED BONES, and all other artificial MANURES, at Messrs. HUNTS' Bone Mills and Manure Works, High-street, Lambeth, London. Established 1816.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek :

Corn and Grass Manure, per ton £10 0 0	
Clover Manure, do. 11 0 0	
Turnip Manure, do. 7 0 0	
Superphosphate of Lime 7 0 0	
Sulphuric Acid and Coprolites 5 0 0	

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 15s. per ton; and for 5 tons or more, 9l. 10s. per ton, in dock. Sulphate of Ammonia, &c.

LAWES'S PATENT MANURE.

WILLIAM E. RENDLE AND CO., Plymouth, are Mr. Lawes's Wholesale Agents for the Sale of his MANURES, and can supply them at Mr. Lawes's prices, delivered at his Factory, Deptford Creek.—Apply to WILLIAM E. RENDLE and Co., Union-road, Plymouth.

GIBBS' GENUINE PERUVIAN GUANO, *warranted*, at 9l. 15s. per ton. In the Import Docks.

GUANO AND OTHER MANURES.

PERUVIAN GUANO of the finest quality (as imported by the Contractors) on Sale; also Superphosphate of Lime, Gypsum, Nitrate of Soda, Salt, and all other Manures of known value.—Apply to MARK FOTHERGILL, 201A, Upper Thames-street, London.

POTTER'S GUANO.—This effective MANURE, now greatly Improved, is confidently recommended as a Dressing for all Spring Crops. It is equal to Peruvian Guano, and 25 per cent. cheaper. Also SUPERPHOSPHATE of LIME, GYPSUM, and SULPHATE of AMMONIA, all of guaranteed quality, and Cheaper than at any other establishment in town or country.

Factory, 28, CLAPHAM ROAD PLACE, LONDON.

GENUINE PERUVIAN GUANO, direct from the Importer's Stores, LINSEED CAKES, and all kinds of Artificial Manures, may be had at London prices, for Cash, of Messrs. ODAMS and PICKFORD, 15, Mark-lane, London.

CORN MANURE FOR WHEAT, BARLEY, OATS, BEANS, &c., &c.

THE LONDON MANURE COMPANY most confidently recommend the above, as they are daily receiving very satisfactory accounts from parties who used it with great success last season. It will be found fully equal to and much cheaper than Peruvian Guano, and is not so liable to produce so large a growth of straw. Price Seven Guineas per ton, 3 cwt. per acre. They also beg to offer their Concentrated Urate, Superphosphate Lime, Nitrate of Soda, Sulphate and Phosphate of Ammonia, Fishery and other Salt, Gypsum, Sulphuric Acid, and genuine Peruvian Guano. To insure this free from adulteration, all purchasers can receive it direct from the Warehouses of the Importer.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.

Country Dealers and Agents supplied.

GUANO AND OTHER MANURES.—Superphosphate of Lime (See reports of experiments in Royal Agricultural Society's Journal, Vol. 6, Part 2), Guano, Peruvian and Patagonian, Gypsum, Salt, Nitrate of Soda, and all other Manures of known value on sale. A Pamphlet on the above forwarded on receipt of four postage stamps.—Apply to MARK FOTHERGILL, 201A, Upper Thames-street, London.

CORN MANURE.

BLASHFIELD'S PATENT COPROS.—A new Manure for Corn and other Crops, containing Ammonia, Phosphate of Lime, Potash, Soda, Magnesia, Soluble Silica, or Silicate of Potash, &c. Price, delivered alongside a vessel, or any Wharf in London, 8l. per ton. It is sold in a finely-ground dried powder, by the Patentee, at No. 3, New London-street, Mark-lane, London.

Superphosphate of Lime, Gypsum, Sulphate of Ammonia, Sulphate, and Nitrate of Soda.

TO AGRICULTURISTS.

COMPOUND CARBONISED ANIMAL MANURE.—This MANURE is composed of a combination of highly fertilising artificial substances with natural animal products, so as to contain, in a concentrated state, all the elements that are best calculated, not only for promoting the germination of seeds and luxuriance of growth in vegetation, but increasing the produce, as well as improving the quality, of the crop to which it has been applied. It is prepared either to be suitable for general purposes, or expressly for each particular kind of crop, as may be required, and its beneficial effects upon the soil will continue for several years. Price (net cash) per ton, from 7l. 10s. to 10l.; the quantity to be applied from 3 to 4 cwt. per acre, according to circumstances.

Orders to be addressed to the MANAGER at the MANUFACTORY, Middle-yard, Great Queen's-street, Lincoln's-Inn-Fields; or to HENRY COLES (Agent for the Sale), 32, Cranbourn-street, Leicester-square. TERMS.—Cash on delivery. Post-office orders to be made payable at Charing-cross.

BY HER MAJESTY'S  ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed charged, from 1s. 3d. to 1s. 6d. per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7d. to 9d. per foot. HEATING BY HOT WATER.

HOT WATER APPARATUS AND HORTICULTURAL BUILDING.

W. HILL begs respectfully to announce that his improved "FLUE BOILER" may now be had in sizes to suit every description of Apparatus, from that of 100 feet to 2000 feet of 4-inch pipe. Improved STEAM BOILERS, from one-horse power and upwards, adapted either for stationary or portable engines, and guaranteed to be most effective.

Every description of Horticultural Building constructed upon the best principle. Buildings of any kind heated by hot water.

*** A liberal Discount to the Trade.

W. HILL, Horticultural Works, Greenwich.

TO NOBLEMEN and GENTLEMEN who require a plentiful and CONSTANT SUPPLY of PURE WATER at their Country Mansions.

Messrs. EASTON and AMOS beg to offer their improved PATENT HYDRAULIC RAM, which is perfectly self-acting, and without manual labour is capable of lifting water to 30 times the height of the waterfall by which it is worked.

THIS MACHINE CAN BE APPLIED WHEREVER A FALL OF WATER OF A FEW FEET CAN BE OBTAINED, and its cheapness and durability, with the fact that upwards of 500 of them erected in England and other countries by Messrs. EASTON and AMOS have now been at work many years, afford ample proof of its great value and efficiency.

Estimates of the expense of the Machine, Pipes for the conveyance of Water, Tanks, and Reservoirs, may be had on application to Messrs. EASTON and AMOS, CONSULTING ENGINEERS to the ROYAL AGRICULTURAL SOCIETY, at their office in Orange-street, Trafalgar-square, or at the Works in the Grove, Southwark, London.

IRON AND WIRE FENCING, AND METALLIC BEDSTEADS.

THOMAS PERRY AND SONS, 252, OXFORD-STREET (NEAR HYDE PARK), And Highfields Foundry and Wrought-iron Works, Bilston, Staffordshire, Manufacturers of all descriptions of PLAIN AND ORNAMENTAL IRON AND WIRE FENCING, Park Entrance, Carriage and Field Gates, Wickets, &c.; Deer, Sheep, and other Hurdles; Hare and Rabbit-proof Wire Fencing; Iron Bedstead Makers to the Board of Ordnance; And Government Contractors.

The works of Messrs. PERRY being situated in the heart of the first iron district, they are enabled to execute all orders with the greatest facility; and on the most moderate terms. Drawings made and estimates prepared, if required. The show rooms contain an immense variety of every description of Iron and Wire-work, and are the largest in London. An Illustrated Catalogue of Bedsteads, with dimensions and prices, sent on application, post-free.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S  ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are F. M'NEILL AND CO.'S Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

The Agricultural Gazette.

SATURDAY, MARCH 30, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, April 3—Agricultural Society of England.
WEDNESDAY, — 10—Agricultural Society of England.
THURSDAY, — 11—Agricultural Imp. Society of Ireland.

ARTIFICIAL LAKES AND PONDS made in aid of landscape gardening, or as decorative objects in pleasure-grounds, are almost necessarily so circumstanced, that in the course of a few years they become clogged by the deposits from the streams that supply them, and would be eventually filled up by alluvial and vegetable matters, were they not periodically emptied, and their concavity renewed, by throwing out the intrusive materials. Inquiries are often made as to the profitable application, &c., of such mud. It is of course right to make the most of it; but supposing it to be of *no* value, a pond in a gentleman's pleasure-ground must be decently clean, or it had better take itself elsewhere, after the fashion of an African *mirage*. If it cannot be made respectable at a profit, it must at an outlay. The greenhouse is not expected to turn out a remunerative part of the establishment, nor may the ornamental water be viewed rationally with a mercenary eye. Boccius's speculations about fresh-water fish will not stand the scrutiny of their balance-sheet in England, and the mud itself ought in fact to be taken as so much manure gained, while the cleaning it out belongs to the regular expense of keeping up the domain.

But pond-mud of any long standing accumulation is, we believe, of greater value as manure than is currently suspected. It consists of minute, finely-divided particles of earths, and of the remains of

decayed vegetables and of defunct living creatures—materials which a very slight preparation renders the most suitable food for plants. It contains a considerable proportion of animal matters; in proof whereof, any time during the months of May, June, July, or August, take a landing-net lined with cloth, fish out a few samples of this mud, and empty them on the grass; you will soon see scores of swimming, crawling, and even flying things (very curious and interesting too*) struggling to escape: next day break up these half-dried patches of mud, and you will find other living creatures; besides all which, it may be assumed that there are thousands of others, "invisible or dimly seen,"—millions more probably—objects for the microscope, in these three or four netfuls of mud. Even these organised atoms when dead, must, to a degree, animalise the mud as manure. In the winter months they have all perished, or are dormant. Let not the farmer suppose that by scattering them on his Grass lands, or mixing them in his dung-heap, he will thus be introducing destructive grubs; he will no more make them assume that character than he can make the Victoria regia take the place of the Wallflower on a ruin. Removed from their proper element they perish and decay. Pond-mud thus containing an appreciable per-centage of animal matter, it must be contrary to good practice to mix lime with it, as is usually recommended.

To cleanse a long-neglected piece of shallow water of any extent, is a task which requires a thoughtful steady determination, and will not succeeed well if thrown off in a hurry. It is not the gangs of men, and the tubs of beer that will suddenly effect the clearance satisfactorily. It must be a work of some time, and therefore cannot well be commenced in the spring, as the increasing power of the sun would soon raise offensive and unwholesome exhalations from the exposed surface. The time of year most suitable to make a beginning—and the writer has tried both the summer and the winter practice—is in October, as soon as the grand autumnal fall in temperature has taken place. Then open the sluice-gate at the lower end of the lake, having placed a wire guard before it to prevent the escape of fish, and let every drop of water that will, run off. From this time the sluice must be kept constantly open, for drainage. At the end of a week, or before, if the weather be fine, a few experimental cuts may be made into the mud, to try its stiffness, and act as side drains; that within reach of the bank may be thrown out with the spade. If the bottom be sufficiently hard, the mud further in may be barrowed up, as soon as it has attained a sufficient consistency; if the bottom be soft, planks must be laid down, and shifted as ocasion requires, for broad-wheeled barrows to travel on. Cuts extending into the body of the mud will continually be made, as judgment dictates, so that it may be brought as near as may be at least to the stiffness of a Cambridge cheese; that first thrown out on the bank will be carted away, as soon as it is firm enough, to make room for a second casting to lie, and drain a few days in its turn. The mud thus becomes as manageable as any other earthy manure; but the process cannot be rapid. The proprietor must be content to behold, for a season, a dark hollow, instead of a bright sheet of water. It will be found that the work never goes on better (after this drainage), or with less discomfort to the men, than during a hard frost; and as the winter advances, the materials, losing the water with which they were saturated, become still more easy to deal with. It is better to finish the work as it proceeds, leaving the bottom in the state in which it is finally to remain, than to do things by halves; and the forwarder the task advances, the more quickly it will be found to run off. But if there has been a heavy crop of perennial waterweeds, two clearances will have to be made (of the weeds first, and of the mud afterwards), unless there is sufficient room on the spot for the whole mixed mass that is thrown out, to lie and consolidate. The water, of course, will not be turned in again till the cleansing is complete, even if it be continued till next April or May.

There is a machine called the Didling Machine, used for deepening the courses of slow-running navigable rivers, and bringing up the mud that is perpetually deposited there. Its origin is this: at first, on such streams, men, called "didlers" (the first syllable pronounced like the word *die*), were employed to hoe up the mud from the bottom of the river, by means of an iron pouch at the end of a long pole. The mud so brought up was deposited in the flat open barges in which the didlers moved up and down the stream, and was discharged at certain stations; but it was a slow and laborious proceeding. Afterwards a contrivance for more efficient work was made by attaching a number of large iron pouches or buckets to an endless chain traversing perpendicularly on a frame-work in a large barge. The motive power is, in some cases horses, in others steam. The barge, or Didling Machine, is moored so that the lowest bucket cuts into the mud, the endless chain revolves, the bucket rises on the outward side laden, and is followed by the others; in passing the highest point of the chain, it is reversed, and discharges its cargo into the barge, and then redescends to the bed of the stream.

These bulky machines cannot easily be brought to bear upon lakes that are inaccessible to them by water conveyance. We have seen an attempt to drag the mud on shore, by horse-power, with an iron bucket similar to those of the Didling Machines. But the barrow and spade perform their task more neatly, as well as more efficiently: and the plan here recommended supplies employment during the dead months of winter. It appears to the writer, that mixing the mud with lime, salt, &c., is a needless expense, and at best does no good; Nature does not make these mixtures with her alluvial deposits. In his own case, as soon as the first casting of mud was firm enough to cart, it was set out in heaps, both on pasture land, and on the layer (mixed seeds) for next year's upland hay, as thickly as appeared safe to avoid killing the plant or preventing the Grass from getting through. In a few days the heaps had still further drained off their moisture, and were spread. In frosty weather the mud adhered in solid lumps; still it was carted and spread as before; with a thaw the lumps fell to pieces. In due time, bush-harrowing, and stone-gathering, and rolling took place. The effect has been most beneficial. In very early spring both the length and colour of the herbage showed to an inch where their mud had been applied, reminding us of Dr. FRANKLIN's writing GYPSUM in immense capitals on a roadside Cloverfield. What is not wanted for these purposes goes to the manure heap, either to make bottoms, sides, or top, or to be mixed with the entire compost, and so increase (what after all is a material point, especially on light lands) the *bulk* of the year's manure. A slight addition of more highly-seasoned matters from towns, then makes the whole into a valuable fertilising mass; and thus we have the pleasure of again beholding our lake clear and brilliant and pure, a luxuriant crop of meadow Grass and upland hay, and a mountainous muck-heap to cut at and cart from, for Turnips or other green crops. *D.*

* Once or twice in the summer the writer entertains a fishing party, consisting of a few little children, by thus capturing all small possibly obtainable water-creatures, and depositing the entire catch in a glass vessel filled with clear water, to be kept as a raree-show as long as the things survive. The reader would be astonished at the immense number and variety of specimens thus collected in an hour; their movements and habits afford amusement for days.

ARE not poor's-rates in many districts a burden of serious weight upon the cultivators of the soil? And—THE CONDITION OF THE LABOURER—is it not a subject interesting to agriculturists on other grounds as well as the merely economical, on which the poor's-rate aspect of it rests? What subject can commend itself more fully to the sympathies of farmers? for agricultural labourers are their neighbours—the population amongst whom they dwell. And what subject is more important to a full consideration of the *business* of farming; for upon the character and ability of the labourer, and, therefore, upon the circumstances affecting his character and ability, farm profits in a great measure depend. We certainly think that agriculture generally would greatly benefit—if the right means were indicated and adopted for improving the condition of the agricultural labourer.

Now, few things would tend more powerfully to the attainment of this end, than a knowledge of the actual circumstances in which labourers exist throughout the country. We should then be able to trace the causes of the striking differences which, in different localities, those circumstances display; and we should also be able to trace the connection, if any, between the circumstances of the labourer and those of the farmer—both matters of first importance to the full discussion of the subject. Well!—with a view of acquiring such a knowledge, we lately sent a list of questions to gentlemen residing in the different counties of England and Scotland, who had before kindly answered inquiries issued from the office of this Paper; and we have received a good many very instructive replies, of which we hope soon to make use. The idea entertained was, that the information thus obtained would be agriculturally useful; no theory was held connecting the subjects of wages and prices—none, indeed, upon any other of the relationships which wages and employment no doubt possess. The answers asked for were not expected to illustrate the soundness of any preconceived idea upon the subject at all—they were only expected to tell the TRUTH upon a topic of unequalled importance; and its usefulness on this ground alone, it was supposed, would justify all the trouble of the inquiry, whether to those who instituted it, or to those who should kindly forward it. How grotesquely absurd then is the mistake which sees in this inquiry a deeply-laid scheme for the injury of agriculturists—"an engine to be used for their destruction!" We refer to the following letter which appeared last Monday prominently placed in the columns of the *Mark Lane Express*:

"BEWARE OF FALSE FRIENDS.

"TO THE CULTIVATORS OF THE SOIL IN GREAT BRITAIN.

"BROTHER FARMERS,—The editor of a free-trade Paper has issued circulars requesting answers to a string of questions proposed in reference to the value of labour. And if it shall appear that wages have not fallen commensurate with the price of produce, your laudable but mistaken zeal to employ the labourers at a higher rate than you can afford will be used as an engine for your own destruction, in an endeavour to show that distress, deep and wide spread, does not exist amongst agriculturists. To those who have received circulars permit me to say, Do not reply to them. I am, gentlemen, most truly yours, "SUSPICION."

Following immediately the issue of our circulars upon the subject it names, we must suppose that the letter of "Suspicion" here alludes to the *Agricultural Gazette;* and if any doubt existed on the subject it would be removed by *Bell's Weekly Messenger*, which introduces our title, without reserve, into the same letter. The description thus given of us, inaccurate as it is, will probably serve the purpose better than any other would have done. But we assure the writer that he is entirely mistaken in attributing to us any object whatever beyond that of ascertaining the truth. He judges of our conduct by his own, and fancies that all men's ways are as crooked as those along which he stumbles. "To those who have received the circulars permit me to say, Do not reply to them!!" What a paltry display this is! Suppose that "Suspicion" shall have succeeded in entering the minds of our correspondents: they will, no doubt, act upon this advice—and our humble attempt to ascertain the facts regarding the condition of the agricultural labourer will for the present have failed. But is any one the better for ignorance on this subject? Will suspicion, tending to perpetuate ignorance, have benefited the party entertaining it?

We do not, however, fear its influence on the present occasion. We believe that there are too many entertaining a cordial anxiety for the attainment of the truth, too many with a confident determination to publish it whatever it may say, and to follow it wherever it may lead—for the efforts of one against so good a tendency to prevail.

LODGING AND BOARDING LABOURERS.

WHEN Mr. Sotheron took his farm in hand about four years ago, he found, as usual, a barn of double the size required, and divided one end of it into three compartments, a dining hall, a sleeping room containing six beds, a washing room with a loft over it, for keeping chests of clothes, and a sink communicating with the tank in the yard. The barn doorways are walled up with brick and fitted with glass casements, a large window with a swing sash is opened over the sleeping apartment, one of the threshing floors forms the dais of the dining hall, on which stand a plain large table and some wooden chairs. A lamp, and a long pole for drying clothes, are let down by pulleys from the tie-beams of the roof, a plain hearth and chimney-corner have been added at the end, and a cupboard completes the furniture. In this building from five to seven lads have been housed and fed during the last four years. Their wages commence at 4*l.*, and rise gradually to 8*l.* 10*s.* per annum. They purchase their own clothing out of their wages. The married man is a good workman and manages the steam-engine. Several of the boys have become excellent ploughmen and have won prizes. After work they occasionally amuse themselves with cricket or other games, or with reading and writing, playing the flute, &c. The weekly expenses of their board per head are as follows: Bread and flour, 1*s.* 1*d.*; Meat and bacon, 2*s.*; Groceries, 1*s.* 0½*d.*; Beer, 1*s.*; Total, 5*s.* 1½*d.**

They are allowed to come at 16 years of age, and remain till they marry or obtain situations. The youngest boy cleans out the room, and they take it in turns to prepare the table for meals, which are cooked by the wife of the bailiff, who lives in an adjoining house, and has the assistance of one female servant, who is not allowed to go into the building where the young men live. The bailiff's wife also provides for their washing. The young men are under the superintendence of the

* The following details are taken from the average of the consumption for several weeks:

38 lbs. of bread, at 1½*d.*	£0	4	9
4¾ lbs. of flour, at 1½*d.*	0	0	7¼
9½ lbs. of butcher's meat, at 5*d.*	0	3	11½
14½ lbs. of bacon, at 5*d.*	0	6	0½
5½ lbs. of cheese, at 6½*d.*	0	3	0
2¼ lbs. of sugar, at 4*d.*	0	0	10
⅝ lb. of coffee, at 1*s.* 2*d.*	0	0	5½
¼ lb. cocoa, at 8*d.*	0	0	4
2 lbs. rice, at 2*d.*	0	0	4
Pepper, salt, &c.	0	0	3
Board of five boys	1	0	6½
Board of one boy	0	4	1½
Beer in addition	0	1	0
Actual food of each boy	0	5	1½

To this must be added a small sum per head for washing, soap, and candles and firing.

bailiff, who presides at their meals, and reads prayers with them morning and evening. A bell rings at meal times, and those who are absent from a meal without leave or good cause, go without it. They are required to observe some rules, few and simple, tending to order and cleanliness—such as sit down to their meals in clean smock frocks, which they put off when they go out again to work. I ascertained that these rules are in no way irksome to them, but have inspired them with a feeling of self-respect—as their phrase is, they are glad to keep themselves respectable. I sat with them at their breakfast table, and conversed with them while the bailiff was out of the room, and can therefore testify to their demeanour being at once intelligent and respectful. There can be little doubt that such a plan, carried on with kindness and good sense, must tend to the best results, and such, in fact, have been produced.

Of the total number of youths who have been admitted, two have married, one of whom works on the farm, the other for a neighbouring gentleman; four have been placed out in good situations; three, having absented themselves without leave, were not taken back; one left owing to ill health, and afterwards died; five are now at the farm. None have misconducted themselves, nor been discharged for any fault.

In connection with these arrangements for the boarding of the farm servants who live in the house, two advantages are provided for the other labourers. A cup of cocoa is given to every person employed on the farm at the time appointed for the beginning of work; and during the winter months nourishing soup is offered to those who choose to pay for it, at the rate of one halfpenny per quart, which covers the actual cost, and is even more valued than it would be if it were given without payment. The early cup of cocoa is found to have the great merit of allaying the feeling of thirst during the day, which is so great a temptation to labourers: this probably is owing to the irritation of the stomach caused by beginning the day's work fasting being prevented.

The receipt for the soup, which is made *à la Soyer*, is as follows: Meat, 2 lbs. minced, 9*d.*; Sago, 6 lbs., 1*s.* 6*d.*; Pepper and salt, 1*d.*; Total, 2*s.* 4*d.* Making 16 gallons, which are sold for 2*s.* 8*d.*, leaving 4*d.* to set against the value of the vegetables grown in the garden, fuel, and the time of the servant who makes it.

The merit of these plans, especially of the boarding of the boys, seems to be, that they are natural and simple, in fact a revival of an old English habit, universal some years ago, and still practised, even on very large farms, in the north of England, but driven out in the southern counties partly by the encouragement given to early marriages under the old Poor-law, and partly by the refinement of modern habits, which have banished the labourer from the society of his master, whereas he would derive great advantage from it, and be made a more useful servant. *T. D. Acland, in the Journal of the English Agricultural Society.*

RELATIVE MERITS OF ROTATIONS.

a The first Norfolk, or four-course rotation, may be supposed able to yield in the

1st year. 25 cwt. of Wheat straw per acre.	3d year, 20 cwt. of Barley straw.
2d, 19 tons of Swedish Turnips	4th, 11 tons of Clover and Grass.

This is equal to 30 tons of green food in four years, or 7½ tons per acre per annum, a quantity which, at the rate of 1 for every 150 lbs., is able to produce about 1 cwt. of beef per annum.

b In the second, when this rotation is extended one year, by keeping down the Grass two years, we may suppose a somewhat larger acreable produce of green crop. Thus—

1st year, 25 cwt. of Wheat straw.	3d year, 20 cwt. of Barley straw.
2d, 20 tons of Swedes.	4th, 11 tons of Clover.
	5th, 7 tons of Clover.

Giving 38 tons as the produce of five years, or nearly the same acreable produce per annum as in the former case.

c We now may take the Dunbar six years' course of crops as our third rotation, and here we may expect

1st year, 20 tons of Swedes.	4th year, 25 cwt. of Wheat straw
2d, 20 cwt. of Barley straw.	5th, 25 cwt. of Bean straw.
3d, 12 tons of Clover.	6th, 25 cwt. of Wheat straw.

Which will yield 32 tons of green food, or 478 lbs. of meat per acre in six years, a quantity equal to about 80 lbs. per acre per annum.

d In our fourth instance we take the eight years' course followed on the farm from which we write. It may produce

1st year, 25 cwt. of Wheat straw.	5th year, 25 cwt. of Wheat straw.
2d, 25 cwt. of Bean straw.	6th, 12 tons of Clover.
3d, 25 cwt. of Wheat straw.	7th, 25 cwt. of Wheat straw.
4th, 24 tons of Mangold Wurzel.	8th, 20 tons of Swedes.

Or, in eight years, 56 tons of green food, corresponding, according to our original datum, to 104 lbs. of meat per acre per annum.

e As regards heavy land rotations of crops, we take the following from Mr. Stace's Essay on that subject in the 4th vol. of the Journal. It will produce probably

1st year, 12 tons of Vetches and 16 tons of Rape and Turnips.	4th year, 25 cwt. of Wheat straw.
2d, 25 cwt. of Wheat straw.	5th, 25 cwt. of Bean straw.
3d, 12 tons of Clover and Tares.	

Or 40 tons of green food, *i. e.* about 600 lbs. of meat per acre in five years, equal to nearly 120 lbs. per acre annually.

f Our last instance shall be selected from Professor Low's work, where it is praised for its suitability to rich clays. It may yield

1st year, nothing — summer fallow.	4th year, 25 cwt. of Oat straw.
2d, 25 cwt. of Wheat straw.	5th, 25 cwt. of Bean straw.
3d, 12 tons of Clover.	6th, 20 cwt. of Barley straw.

It thus produces 12 tons of green food in six years, or 30 lbs. of meat per acre per annum. It is proper to remark that the above estimates are more likely to be relatively than positively true; the datum on which their produce of meat is calculated is, of course, subject to the vicissitudes which affect all agriculture, and stultify all farm estimates. The herd which is to convert this food may be carried off by disease, and its produce of meat will then of course be anything rather than 1-150th the weight of the food. But all the rotations named are liable to this risk alike, and it may therefore be useful to compare them:

Name.	Period.	Pounds of Meat produced per acre per annum.
a Norfolk	4 years.	110
b Ditto	5 ,,	110
c Dunbar	6 ,,	80
d ——	8 ,,	104
e Stace	5 ,,	120
f Low	6 ,,	80

Of these the 5th is less likely to realise its estimate than any of the others, as its large produce depends upon the possibility, on an average number of years, of obtaining 16 tons of Rape or Turnips on a clay soil after a spring crop of Vetches, and this is extremely doubtful. Of the fourth rotation—our own—we would only say that we have grown in the past year 30 acres of Clover (15 of them for horses), 30 acres of Mangold Wurzel, 15 acres of Swedes and Turnips, 14 acres of Carrots and Potatoes (of which at least 12 acres have been sold, or eaten by horses), so that on three-eighths of the farm we have had a produce for consumption of 960 tons of green food; and if all had been converted into meat, as it might have been, the produce available for that purpose would have been—

30	acres of	Clover	= 360 tons.
30	,,	Mangold Wurzel...	= 420 ,,
15	,,	Swedes	= 300 ,,
14	,,	Carrots, &c. ...	= 280 ,,
		Total	1360

The meat made from 960 tons has been as follows:

	lbs.
70 sheep bought at probably 15 lbs. a qr., are being sold now at 25 lbs., = 70 × 40	2,800
About 160 sheep bought at 13 lbs. a qr., will be sold in April at probably 23 lbs., = 160 × 40	6,400
10 oxen weighing 5 cwt. have become 6 cwt. each ...	1,120
20 oxen weighing 6 cwt. have become 8 cwt. each ...	4,480
6 cows weighing 5 cwt. have become 7 cwt. each ...	1,344
Add say 30 cwt. of bacon and pork	3,360
Total meat made	19,504

But at least 240*l.* worth of food have been purchased, and if it be supposed to have made its worth of meat, which is, by the way, a very doubtful thing, then at 6*d.* per lb. we must deduct at least 9504 lbs. from the amount of meat made, leaving 10,000 lbs. as the produce of 960 tons, or about 13,000 lbs. as the produce of 1360 tons—the produce, in fact, of a farm of 240 acres. This is only about 60 lbs. of meat per acre; it is only 1 lb. of meat produced by the consumption of about 200 lbs. of green food. It is a result, however, probably as near the truth as we can attain; including the circumstances of illness suffered by stock, and of a deduction of the whole value of cattle-food purchased.

In the sixth rotation named, the small produce of meat illustrates the effect of the naked fallow. I believe that there is no more effectual method of increasing our supplies of animal food than the substitution of a green crop, such as the Vetch, the Cabbage, or the Mangold Wurzel—all clay soil plants—for the naked fallow. This substitution could be effected without expense, that is at a cost paid for by the additional returns it would produce; a crop of 24 tons per acre once in four or six years would be a clear gain of animal food to the amount of 90 or 60 lbs. respectively per acre annually over those districts which admit of the change. *English Agricultural Society's Journal.*

Home Correspondence.

Prices.—In a letter from C. Wren Hoskyns, Esq., in a late Number, he gives the average prices of Wheat at the various European ports; upon reading this statement I was greatly surprised, having during the debates upon the Corn-laws been engaged in committee with several merchants and agriculturists to investigate what had been the average prices of corn (for the 10 years preceding that period) at the foreign ports referred to in this letter; and the conclusion arrived at was 28*s.* 6*d.* per quarter. After I had read Mr. Hoskyns' letter in your Paper, the debates which took place upon the budget on Friday last came to hand, in which Mr. Newdegate in his speech contradicts the statements of Mr. Wilson, as quoted by Mr. Hoskyns, and which not only disproves the accuracy of Mr. Wilson's statements, but corroborates those which myself and the gentlemen appointed upon the committee had obtained. I give Mr. Newdegate's speech, as extracted from the *Morning Herald*, verbatim, as best explaining the subject. "The hon. member for Westbury, Mr. Wilson, had on a former occasion stated that the average price of Wheat from 1839 to 1846 was 43*s.* 4*d.*, whereas, according to the statistical archives, it was 27*s.* 3*d.* The hon. gentleman had cited the authority of the Prussian Government, and he (Mr. Newdegate) held in his hands the official documents—the statistical archives—contradicting such a statement. He would now give the average prices set forth in the statistical archives between 1837 and 1846. In Hamburgh, it was 26*s.* 3*d.*; Lubeck, 29*s.* 4*d.*; Dantzic, 25*s.*; Stettin, 23*s.* 8*d.* For some years he had been studying this question, and he said, when he looked at the information upon which public men relied, he could not be surprised at their mistakes." He proceeds by stating that "the average price of Wheat in New Orleans from Sept. 1, 1843, to the end of 1845, was 24*s.* 8*d.* the quarter, the expense of freight to this country was 10*s.*, giving an average of 35*s.* per quarter." I have no desire to enter into any controversy upon the subject, nor to advance any opinion contrary to what I consider the facts will justify, but at this momentous period, when rents are becoming adjusted throughout the kingdom, it is most important both to landlords and tenants to obtain correct information upon the subject; and, therefore, still more important whether the pivot or price upon which such arrangements are to be based shall be assumed at 38*s.* or 48*s.* per quarter. My own opinion coincides with the former, and in Mr. Newdegate's words, having many years made it a study, I, from these investigations, feel confident that the price of foreign Wheat, free in British ports, will range between 35*s.* and 40*s.* per quarter, and this independent of quality—an element rarely taken into consideration by writers and speakers upon the subject—as for some time past, and at the present moment, Dantzic Wheat of 63 lbs. per bushel is worth 1*s.* per bushel or 8*s.* per quarter more than Wheat grown in this country of the same weight. This difference in the quality will always give an advantage to the foreign grower in favourable seasons, but in unfavourable seasons the preponderance in favour of foreign Wheat will be still greater. As I am deeply interested in this question, from having been of late called upon to make new adjustments of rent between landlords and tenants, I feel the importance of the question, and therefore claim the indulgence of the insertion of this letter in your widely circulating paper. *Robert Baker, Writtle.*

Spade Labour &c.—As it is admitted by all agriculturists that the spade is a superior cultivator to the plough, it would be well for the manufacturers of farm machines to turn their attention to that implement. The facility with which machinery has been made to turn any number of spindles, could also be applied to spades. In your *Gazette* for March the 2d "P. S.," in his article on a steam cultivator, draws the mechanic's attention to the mud scraper used on roads, gathering up the soil, and mixing it with manure in the machine. If this plan could be carried out, it would be necessary to pass the soil over a second roller, with forks to loosen the subsoil; the revolutions required to carry it through the machine, that it might fall after the fork roller, would also pulverise the soil. The manure to be spread on the ground previous to using the machine. What would our manufactories be, if a person was required to spin each thread as in days of yore; and yet the spade was quite as good a tool at that time as now, and a labourer could turn up as much ground in a day. From the irregularities in land, the machine perhaps should not be broader than a common roller, but that would carry a great number of spades. Like "P. S.," I am no mechanic, but one that delights in everything that tends to raise the labourer, and therefore consider the use of the spade and flail a disgrace to the present age. Now although machines of this description would require men of a different calibre to the present farm labourer, I should be sorry to see them worked by any other than those that are continually employed on the farm. And nowhere would an intellectual person improve the home as in a farm house, from necessity isolated, filled with beings whose employments are a continual source of health and excitement, to whom a few hours' mental study in the evenings would be the most agreeable relaxation. An intellectual person to work the steam engine (that might be made applicable to other laborious work, as well as the spade cultivation), should be a continual teacher of useful knowledge, and I hope soon to see such a schoolmaster on every farm containing 100 acres. A knowledge of chemistry would show that Nature's laboratory acts in their dung pits as in the growth of crops; that allowing the gases to be washed away by rain, or to escape in the air, is as foolish as to leave their ricks exposed to the depredations of vermin. With knowledge they would require no recommendation to cover the dung pit, or make manure tanks, but be as careful of the gases that are so ready to fly off, as a lover of perfume is to secure the stoppers of his bottles. *Anon.*

Water-wheels for Driving Farm Machinery.—I am anxious for information with respect to the applicability of water as an impelling power for farm machinery. Having a very large and deep pond of water, supplied by a moderate but constant stream, and being about to erect a farmstead near to this reservoir, it has been suggested that this water should be applied as a motive power to a threshing-machine, chaff-cutter, &c. There is a fall of upwards of 9 feet. The question is, what would be the expense of putting down a wheel, and which is the best description? I am told that the horizontal wheels (Whitelaw's patent, or the turbine) are better, much cheaper, and more simple, than the vertical overshot, or breast-wheels. The supply of water would not be sufficient in this case for the undershot wheel. Would anyone acquainted with the working of a wheel put up on a modern principle, at an expense that a tenant-farmer might encounter, capable of threshing and driving other machinery, inform me of the working of it, and where one might be seen in operation? Mr. Whitelaw, I understand, states in his pamphlet (published some years ago, and which I have not yet seen) that he can erect one of his patent mills equal to the power of eight horses for 40*l.* The situation of the pond and the premises are as favourable as if formed originally for the purpose now contemplated. Any

information from practical parties would be esteemed a great favour, and might be of much service to—*Aqua Pura.*

Intrinsic v. *Economical Values.*—The proportion of nutritive matter found in different kinds of grain is stated by Einhof, a German chemist, to be as under: Peas, per cent., 75; Wheat, 74; Rye, 70; Beans, 68; Barley, 65; and Oats, 58. But as the preference of one grain over another, as an economical food for cattle, is also dependent on their price, it may be interesting to see the feeding value of each grain, at the prices here supposed:

Oats, at 20*s.* a quarter	2.9	Beans, at 30*s.* per quarter	2.2
Peas, at 30*s.* ,,	2.8	Barley, at 30*s.* ,,	2.1
Rye, at 25*s.* ,,	2.8	Wheat, at 40*s.* ,,	1.8

Whence it appears that Oats are the cheapest and Wheat the dearest article of food, and that the proportion between their feeding values is rather more than 3 to 2. *Mordaunt Barnard.*

The Growth of Flax in Kerry.—The Rev. B. O'Connor has, with his accustomed energy, given the first impulse to a more extended cultivation of Flax in this county. Nothing has tended more to raise the physical condition of the people of the north, than the successful cultivation of this important element of the national resources of Ireland. The climate and soil of Kerry are peculiarly suitable, and capable of producing the very best qualities. The Flax will always meet with a ready sale through commission agents in Belfast, charging a small per-centage, and the seed may be turned to advantage in various ways. The heaviest and best can be retained till the next spring, and given out to the tenants for sowing. Any quantity of the remainder will find a market with the oil-crushers of Dublin, Belfast, or Liverpool. The value of the seed in all kinds of stock is so fully established, that it is unnecessary to do more than refer to the report of the Flax Society, and the publication of Mr. Warnes of Trimingham. It may be added that upwards of half the rental of Ireland is annually paid to foreigners for Flax, Flax seed, and oilcake. *T. S.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A WEEKLY COUNCIL was held at the Society's-house, Hanover-square, on Wednesday last, the 27th of March: present, Mr. RAYMOND BARKER, V.P., in the chair; Sir Robert Price, Bart., M P., Mr. B. Almack, Mr. Wyrley Birch, Mr. Bosanquet, Mr. Burke, Mr. Clavering, Mr. H. Dixon, Mr. Dyer, Mr. W. Hutley, Mr. Majendie, Mr. W. Marshall, M.P., Mr. C. E. Overman, Mr. Parkins, Prof. Sewell, Mr. C. Hampden Turner, and Prof. Way.

The Earl of Falmouth, of Tregothnan, Cornwall, and St. James's-square, London, was elected a Governor of the Society.

The following new members were elected:

Maskelyne, A. M. Story, M.A., Bassett-Down House, Swindon, Wiltshire.
Vidal, Edward Urch, Comborough, Bideford, Devon.
Wood, John, Thedden Grange, Alton, Hants.
Carmichael, John, Tilmouth Park, Coldstream, Berwickshire
Parrott, Edward, Buckingham
Dine, Bradley, Gore Court, Sittingbourne, Kent
Beckett, Richard, Doncaster, Yorkshire
Bennett, Luke, Dimsdale Hall, Newcastle, Staffordshire
Edwards, Joseph Priestley, Darcy Hey, Halifax, Yorkshire

ASPHALTIC MANURE.—The Earl GREY, H.M.'s Principal Secretary of State for the Colonial Department, favoured the Council with a statement of the satisfactory results obtained by Vice-Admiral the Earl of Dundonald, in command of H.M.'s naval forces on the West Indian station, from manure prepared from the asphaltum of the great Pitch Lake in the Island of Trinidad, and tried in the Government gardens at Bermuda. His Lordship further stated to the Council, that Lord Dundonald had sent to the Colonial-office a box containing three specimens of the manure in question, and which would be forwarded to the Society for the information of its members.—The Council ordered their best thanks to be transmitted to Earl Grey for the favour of this communication, and gave directions that the specimens referred to by his Lordship should, on their arrival, be placed in the hands of Prof. Way, the consulting chemist of the Society, with a request that he would make a chemical examination of the new manure, and report to the Council his opinion of its value in an agricultural point of view.

MISCELLANEOUS COMMUNICATIONS.—Letter from Sir John Tylden, suggesting that Locomotive Steam Engines, for agricultural purposes, should be made of smaller size, so as to be capable of being drawn by a single horse from barn to barn on farms of moderate size; that Threshing Machines of a more portable character should be constructed, to be attached to the steam-engine, and capable of threshing and cleaning about 10 or 12 qrs. a-day; and that a fixed mill for grinding corn and breaking oil-cake should be more generally adopted in homesteads.—A Report from Mr. R. W. Baker of his further trial of the Australian Barley furnished to him by the Society.—A copy of the Farm Account Book prepared for the use of the National Agricultural Schools in Ireland, and transmitted to the Society by the Board of Education in Dublin.—Impressions of the dies of the Prize Medals of the Birmingham and Midland Counties Exhibition of Live Stock, Poultry, &c., from Mr. Ottley, of Birmingham, the artist to whom their execution was entrusted.—Statement by Mr. Wyrley Birch, of the working of a model he had seen of a plan for ploughing by steam power; for all which communications and presents the Council ordered thanks to be returned.

HIGHLAND, *March* 13: *The Best Variety of Oats to Sow.*—Mr. FINNIE, of Swanston, said:

Assuming the data of those held to be authorities, we find that the arable lands in Scotland are estimated at about 2,400,000 acres, which are distributed as follows:

In Wheat	220,000	In Potatoes	130,000
,, Barley	280,000	,, Turnips	350,000
,, Oats	1,275,000	,, Flax	16,000
,, Beans and Peas ...	100,000	,, Gardens	32,000

Now, with reference to these extents, agriculturists are called upon to bring their skill, judgment, and enterprise, to bear upon, I believe, about 55 varieties of Wheat, 17 of Barley, 38 of Oats, 163 of Potatoes, 13 of Beans, 20 of Peas, 39 of Turnips, 17 of Clovers, and a much extended and yearly cultivation of natural permanent Grasses. It may indeed be said that there is no situation suitable for cultivation where a variety may not be sown, which, in an average of years, will mature and make a moderate return. According to the information contained in that invaluable work published by Messrs. Peter Lawson and Son, Seedsmen to the Highland Society of Scotland, termed their "Manual," I find there are 40 different varieties or kinds embraced, to a greater or smaller extent, in the cultivation of what may be termed the Oat break of Scotland. I shall enumerate them:

1. The Potato Oat
2. Potato Oat of the French
3. Hopetoun Oat
4. Early Kent
5. Georgian
6. New Early Essex
7. Blue Major Oat
8. Strathallan Early Oat
9. Early Angus
10. Late Angus
11. Grey Angus
12. Cupar Grange
13. Blainslie
14. Kildrummie
15. Common Irish
16. Drummond
17. Macbie Hill, or Red Macbie Oat
18. Loudon Oat
19. Danish
20. Holland
21. Friesland, or Dutch Oat
22. Three Grained White Oat
23. Early White Irish Oat
24. Tam Finlay Oat
25. Argyleshire Oat
26. Red Essex
27. Common Dun Oat
28. Dun Winter Oat
29. Brown or Black Riga or Archangel Oat
30. Common or Old Black Oat
31. Common White Tartarian
32. Black Tartarian
33. Early White Tartarian
34. Short Oat
35. Common Naked Oat
36. Small Naked Oat
37. Animal or Fly Oat
38. Wild Oat
39. Common Denthonia or Bristle-pointed Oat
40. Argyleshire Small Oat.

There is likewise the Barbachlaw, Berlie, or Barley, or Providence, or, as it is often called, the Russell Oat, and there may be others; but really as the same kind often goes under very different names, it is impossible to say whether those I have last mentioned are not already embraced in Mr. Lawson's list. With such a list as I have enumerated, it may appear to some no very difficult matter to make a selection so as to meet the case of every field on a farm; but we practical farmers find, that the earliness or lateness of the seed time, the earliness or lateness of time at which the land has been ploughed, and which is in a great measure regulated by the nature of the winter, the dryness or wetness of the weather at seed time; for sometimes it does occur, from the advanced period of the season, and protracted wet weather, that the old saying of sowing through dub and mire is literally fulfilled—the general character of the summer—the earliness or lateness of the harvest, and the weather that then prevails—the very changing of seed often produces results the very contrary of what occurred in previous seasons. In order, therefore, to induce gentlemen having experience under different circumstances, to favour this meeting with their remarks, I will arrange what I have further to say under the three following heads or divisions: under the first, I will state briefly what appear to me the best varieties of Oats to sow where the land has every advantage from climate; secondly, where the climate happens to be rather of a medium character; and, thirdly, where, from altitude, great risk exists in having the crop matured in even the most favourable seasons. In addressing myself to the first of these, I would say that, on the first class land, the Potato Oat has been found, generally speaking, the most remunerative. It is no doubt true that this Oat has likewise its drawbacks—sometimes it suffers from tulip-rooting—it sheds its seed very easily, and, consequently, there is much loss in both shearing and stalking; by cutting a little quick, the latter evil may, to a certain extent, be avoided; but where the former is found to prevail, I would be much disposed either to substitute the Hopetoun or sow a mixture of the Potato and Hopetoun in the proportions of one-half. I am inclined to think tulip-rooting is often occasioned by the land being ploughed too wet. In the event, however, of this class of land being rather soft, and the Potato when tried liable to lodge, which it very readily does, I would substitute the Berlie. We have likewise the Early Angus and the Sandy. I prefer the Berlie, as it stands up better, and has fewer green pickles in the sample than the Early Angus, and it is a more prolific variety than the Sandy. The Black Tartarian is very answerable for the description of land I am talking of, but being black, it is not very marketable. Mr. Sheriff, to whom we are indebted for the Hopetoun, lately introduced an Oat, which he named the Sheriff Oat; it is an early variety, and not liable to lodge, but some allege the miller complained it was thick in the husk, and did not meal well, but with what correctness I cannot say. I grew it one year as a comparative trial with the Hopetoun, but having none of the first-class land I am now referring to on my farm, I found it unsuitable in my own particular case; but unless for the objection stated by the millers, it appeared to me likely to succeed well on land where the crop was liable to lodge. On the second-class land under this division, I would be partial to the later varieties, such as the Grey Angus, the late Angus, and Hopetoun. The Grey Angus I have always held in great estimation; it gives, on an average of years, excellent produce and good quality of straw. I would prefer, however, as the rule, to adopt a mixture, and for this purpose would select the Hopetoun, with the Berlie or the Early Angus, or the Sandy, or Kildrummie, and these in the order I have mentioned them, as the land declines in fertility; the Hopetoun may be mixed with any of these in the proportion of four of Hopetoun to two parts of the kind selected, or in equal proportions, or even in that of five of Hopetoun to one. For many years on the best managed farms in East Lothian it was customary to sow a mixture of Potato and Early Angus. The Hopetoun, however, is better adapted for such a purpose; 1st, because it is more suitable for the land under consideration; and 2d, it does not tiller out like the Potato; the crop in consequence is not so liable to become too thick—it is a tall growing Oat, and thus shades and retards the ripening of the Early Angus. Berlie or Sandy, which are rather earlier, and besides as the Hopetoun should be cut before being quite ripe, in which case the whole admits of being reaped advantageously at one time. I would therefore conclude, if a mixture is preferred, the Hopetoun and Berlie is most suitable. If, on the other hand, pure seed is sown, I would fix upon the Hopetoun for what I would call, in farmer's language, soft clay land; the Grey Angus for hard clay land, and the latter, even though the soil should be of a lightish character; but take such a district as the Carse of Falkirk or Stirling, I would say that on good land after pasture, the Potato Oat will be often found best, but if after hay stubble, the Berlie, Sandy, or Early Blainslie will be safer. On the inferior land in the last-mentioned district, I believe the Tam Finlay is the favourite. I now come to the second division, that is, where the climate is of rather a marshy character, and here I would be disposed to start with the Hopetoun on the best soils, as I am much inclined to think the tendency to tulip-root in the Potato increases as the climate falls off. The mixture of Hopetoun and Potato may, however, be found answerable. Should the land be rather soft, the Berlie, Early Angus, or Sandy, would be a better substitute. The Sandy is now sown to a considerable extent, but there is a general complaint, and I believe not without foundation, that it is not the most productive kind that may be grown. In one respect, however, I think it suits well, that is, wherever Oats are sown immediately after Turnips I have observed, it does not take on that yellow tinge at an early stage of its growth, as others are too liable to do after Turnips, and bleeds well, but when sown after lea it produces less than what is obtained from either the Hopetoun, Berlie, Grey Angus, or late Angus. Then, on the secondary description of soils under this division, and when it is desirable to sow each kind separately, there is the Early Blainslie, the Kildrummie, the Hopetoun, the Dun Oat, and even the Grey Angus, when the seed time is early, and the field has a favourable exposure. From any of those a selection may be made to suit the particular state of fertility of each field. Should a mixture not be objected to, which sometimes happens where the Oats are generally sold for seed, then four parts of Hopetoun, with two either of Berlie, Early Angus, Sandy, or Early Blainslie, or in the proportion of five of Hopetoun with one part of any of those kinds; or even take Hopetoun and either of them in the proportion of a half; should the land, however, not be in the highest order, Hopetoun and Kildrummie, or Hopetoun and Early Blainslie might suit better. The Dun Oat is another variety that might answer well on the description of land I am talking of. I know no kind that can withstand unfavourable changes of weather better; where others become yellow and sickly, it maintains a good colour. The straw, however, is not of the finest; the Dun Oat meals well, but I have an objection to both Black and Dun Oats, for two reasons—the first is, if in the habit of selling for seed, black pickles lodging about the mill, barn, or sack, and finding their way into a stock of white corn, destroys it when exposed for seed. Another is, the manufacture of meal, like other things, is much improved; there is a black tick or seed which the millers find great difficulty in getting rid of, and this injures the market value. For the lowest class soil, under this division, I believe the Barbachlaw or Tam Finlay may be a good selection. I come now to the last division, and here I would simply remark in the first place, that the earliest varieties must be taken; and 2d, if the land is good and in proper condition, the Early Angus, Berlie, and Sandy, will be the most proper to select. I would give my preference to the two latter in all cases where a Turnip crop is the immediately preceding one; but if the field is much exposed to the wind, or of inferior quality, the Barbachlaw will be found more profitable; it produces a crop under the most unfavourable circumstances, and has excellent straw, and in high winds it does not shed its seed so readily as any I have mentioned. The red Oat may likewise suit this district well. Some allege that it is just another name for the Sandy, but I satisfactorily proved the reverse one season, as I found it to be rather earlier, and straw of good quality, which in a high land district is always an object of great importance. I am humbly of opinion the only way in which a farmer can arrive at the varieties most profitable for him to sow, is for a series of years to test on his own farm the results obtained by comparative trial of the different kinds, both separately and in mixture, and then judge, from an average of years, which of them prove most remunerative. I fear I have already intruded too much on the time of the meeting, and will therefore conclude by stating what results were obtained from two comparative trials I had upon my farm. The first was made with reference to what was likely to answer the lowest and best land upon my farm. The same extent of land produced as follows:

	Bolls.	Bush.
1. Hopetoun and Kildrummie—five parts of the former and one of the latter	14	1
2. Hopetoun and Sandy—five of Hopetoun and one of Sandy	13	2
3. Kildrummie—alone	12	5
4. Early Angus—alone	12	5
5. Hopetoun and Early Angus—five of Hopetoun and one of Early Angus	12	4
6. Dun Oats—alone	12	4
7. Potato—alone	12	2

Mr. SADLER, Norton Mains, said: Never having made any accurate comparative trials of the returns from the different varieties, I feel some hesitation in recommending any particular sort as the most profitable generally to sow. I will, however, state my opinion of those with which I am acquainted, and have grown during the last 20 years; and the first I notice is the Dun Oat, which, although very prolific, both in regard to its yield of grain and straw, has been almost entirely abandoned, owing to its having become so much infected with smut. A few years ago a large proportion of the breadth I had under Oats consisted of the Barbachlaw, Blainslie, and Late or Grey Angus. The first of these is, I think, particularly well adapted for all cold, late soils, as it is a sure grower, and very early. It yields a fair acreable return, but the grain weighs very light; it is in great demand after a late harvest for seed for the upland districts. I have frequently sold them at as high a price as the best Potato Oats. This demand, for some years back, has in a great measure fallen off, owing, I have no doubt, to the early seasons we have lately been favoured with, and the introduction of other and as early varieties. The Blainslie, about the time referred to, was extensively cultivated on most clay soils, and yielded average crops of grain and straw. It is a much finer Oat than the Barbachlaw, and weighs more per bushel; but it is at least fully a week later in coming to maturity. Although also a certain grower, and still raised by some farmers, it has to a great extent been superseded by earlier, and I think also more profitable varieties. The last of these, viz, the Late or Grey Angus, was at this time, in the lower districts of Mid-Lothian, cultivated to a very great extent, and produced abundant crops, without even showing any appearance of degeneracy. Objectionable from its lateness, it gave way to earlier varieties. Notwithstanding, I think it is still a safe Oat to grow on all early soils, and I would not be surprised although it came into general use again. The Early Angus is a finer variety than any of those I have mentioned, and has been long and successfully cultivated upon deep rich soils, for which, or for land broken up from old pasture, it is peculiarly fitted, and will be found to give large returns of grain, and beautiful white straw. The Potato Oat is still, I think, deservedly the most esteemed in cultivation, although less productive in straw, perhaps, than some of the others I have mentioned, and more liable to be shaken than any of them; none yields a greater quantity of grain, or surpasses its milling qualities. It is only suited for good deep soils; owing to its having shown a tendency to thick or sedge root, its growth has in a great measure been abandoned. It may, however, I think, still be safely cultivated upon fresh new land. The Oats which I have mostly sown for some years back, and which have, with the exception of last year, yielded fair crops, are the Hopetoun and Sandy; both are great favourites with the millers, and will generally be found adapted for most soils. The Sandy gives the largest return in a moist season. The exception referred to was two fields of Hopetoun, which were much infected with thick root, and did not yield half a crop. I could not account for it, except that this variety had begun to degenerate, as the seed with which they were sown was brought from a distance, and the land in fairish order. The Hopetoun requires more seed per acre than perhaps any other sort, as they almost invariably come up thin on the ground; and to guard against this, it has become a general, and I think an excellent practice, to mix them either with Early Angus or Sandy, in the proportion of 4 bolls of Hopetoun to 2 of either of the latter, when they generally yield a full crop; it has also the effect of preventing the Hope-

toun from lodging, which they are apt to do, as they are soft in the straw. Three years ago I tried a small quantity of the Sheriff Oats—they ripened very early, but turned out so very unsatisfactorily, the grain being so husky, the straw so short, and the millers so shy about purchasing them, that I have not grown them since. The last I notice is the Berlie Oat. I have not tried it, but intend doing so this year; it is a fine grained Oat, very early, but said not to produce much straw.—Mr. SINCLAIR SUTHERLAND, Dalmore, said: In the Journal of Agriculture for June, 1849, I find a prize report by Mr. A. Gorrie, Annat Cottage, Perthshire, which, besides other interesting matter, contains particulars of seven varieties of Oats, the greater number of which are now generally known. In the "Transactions" for October, 1849, there are two reports on the comparative productiveness of different varieties of Oats. Mr. Mitchell, Wester Alves, Elgin, on a soil of a "clayey nature," in 1848, found the Potato Oat the most profitable. The Hopetoun the least so. The Dun Oat most productive, but not most valuable. Siberian, Sandy, and Berlie sorts, occupying intermediate places. The Late Angus, Mr. Mitchell recommends for quantity of grain and straw. Mr. James Melvin, Bonnington, Ratho, found the Sheriff the most productive of five or six varieties in 1847 and 1848. You all know the great personal interest taken in agriculture by Sir John S. Forbes, Bart., of Fettercairn, who, in a communication with which I was recently honoured, intimates that in the Fettercairn district, for lightish peaty loam, with a coarse, sandy clay subsoil, lately drained, the Sandwich Oat is the most esteemed variety, as it produces grain at least 1½ lb. per bushel heavier than the Sandy or any other; and the straw, though longer, stands better. The Scots Barley Oat is the second favourite, but softer, and does not stand up so well. The Kildrummie Oat ranks third, and has taken the place of the Potato Oat on the exposed coast, because strong and tough in the panicle, and little liable to shake from the action of wind. The Early Angus Oat is much sown on the rich soil of the coast, but does not yield a large crop on medium quality land. I am sure this meeting feel under obligations for this information to Sir John, who observes, in conclusion, that the Late Angus Oat is preferred for clay land in Forfarshire. I have been informed by a well-known extensive agriculturist, Mr. Gow, factor, Raith, that in the Kirkaldy district, on clay loam in high condition, the Potato Oat is found the best; and I notice this particularly, because it agrees with the results obtained on a similar soil by Mr. Mitchell. In the county of Ross, I experimented last season with eight varieties of Oats, and the Society has been pleased to approve of the report which I furnished. The field, a sandy loam of 2 feet deep, situated within half a mile of the sea, and 40 feet above its level, was in the very highest condition, having been two years in Grass, and in addition to the droppings of the stock, had 30 puncheons of liquid manure poured over each acre. With this treatment, I obtained the following results per imperial acre:

Name of Variety.	Quantity of Grain.		Straw.	Quantity of Meal from each qr.
	qrs.	bush.	Stones.	lbs.
The Berlie yielded	9	6	358	198
The Dyock ... ... ,,	11	4	320	198
The Hopetoun ... ,,	9	4	388	180
The Sandy ... ... ,,	7	6	406	202
The Early Angus ... ,,	8	4	296	206
The Late Angus ... ,,	9	5	397	194
The Potato ... ... ,,	8	2	318	182
The Dun ... ... ,,	9	1	332	204

I should state that all these varieties, with the exception of the late Angus and Potato, were procured from Messrs. Lawson and Son, and that I consider the Sandy Oat unsuited for soil in such high condition, as the excess of growth is straw, not grain. But the results must speak for themselves. The Potato Oat I have always found least adapted for profitable cultivation on a sandy soil. The Dyock Oat was then quite new to me, and I do not know that ever there was a second sample sown in the county of Ross.—Mr. M'LEAN, Braidwood, said: My experience and observation in cultivating the Oat, ranges over a period of upwards of 30 years, in a high altitude, from 600 to 800 feet above sea-level, comprising great diversity of soil, situated under a variable and unpropitious climate, yet better adapted for the growing of Oats than any other of the cereal grains; to varieties best suited for seed in these alpine districts, my remarks shall more particularly refer. It must be obvious under such changes of soil, climate, and circumstances, the proper selection of the best variety for seed must be a matter of some difficulty. In the earlier stages of agriculture the later varieties were found more productive of straw, and better fitted to resist the vicissitudes of weather, to which they were constantly exposed. The Barbachlaw, Blainslie, and Tartarian Oat, were in general use; besides affording ample supplies of straw for the use of cattle, their mealing qualities were excellent, though they were deficient in quantity to some of the early varieties. The Barbachlaw was undoubtedly the favourite, and long stood a successful competitor with all other varieties. Its thin and lengthy shape made it eagerly bought for the feeding of horses, as inducing better mastication than any other. While the sowing of the late Oat was persisted in on high districts, they were sown upon the middling or exhausted soils in better climates, for the purpose of supplying their more elevated brethren with good seed corn in bad seasons, when their own was not fitted for that purpose. There are two varieties of the Barbachlaw, the "white awned" and the "black awned," but the latter is inferior to the former, and never used unless by those who prefer cheapness to more important considerations. The Blainslie is principally sown in the south of Scotland, and ranks high as a good mealing and productive Oat. The Potato Oat was the first sown, instead of the later and native varieties, and produced in good seasons, and upon kindly soils, abundant crops, but being easily shaken by the prevailing winds, unless in sheltered situations, great loss was often sustained, and unless in the most favoured spots nearly abandoned. It must still, however, be pronounced the finest variety in cultivation; its plump and compact appearance makes it well adapted for milling, and though requiring strong conditioned land, the improvement by drainage has been conducive to its more general use. The Hopetoun has been pretty generally tried in years past, but seems best suited for kindly soils and favourable seasons. It is rather dorty, and thin in brairding, grows long, though rather coarse in the straw, bleeds well to the acre, and commands a ready sale after harvest, from its plump appearance, but in a bad season loses more in the estimation of the farmer than it gains in many years afterwards. The Early Angus has been long sown, and found to succeed well upon strong soils, and peculiarly adapted for newly improved land, where lime has been liberally applied, ripens early, and seems well suited to promote the growth of the artificial Grasses; upon damp soils, it is apt to produce more greens at ripening, but has long proved a great favourite with the upland farmer. The Sandy Oat was introduced into our district about 10 years ago, and has been extensively grown ever since. It seems well adapted for climates naturally cold and humid, upon poor soils it produces less return per acre than the Barbachlaw; but its fine straw, and early ripening, entitle it to a favourable reception by the farmer. It seems to be losing gradually in its producing qualities amongst the lowland agriculturists. The Berlie Oat is the variety last introduced into the high districts, and though only of few years' standing, the result of that trial justifies me in speaking highly in its favour. In its growth and time of ripening, it much resembles the Early Angus; but excels in the quality as well as the quantity of the straw, besides, ripens more regularly, and always commands a ready market, for making into meal; the increasing demand for it at this season for seed, testifies, that year after year it is becoming a greater favourite with the corn growing farmer. There are many other varieties, such as the Kildrummie, the Halkerston, the Red, the Georgian, the Sheriff, and the Swedish Oat, and an endless variety of names which appear to have been given more from a desire of novelty in the grower, than any distinct difference in their kind, quality, or productiveness, but which all seem to be lost in the more distinct varieties of the Potato, the Early Angus, the Blainslie, and the Barbachlaw. Having thus briefly given a short description of the varieties of the Oat used in the higher districts, I may state that, as far as my experience has ascertained, I would give the preference to the Barbachlaw, the Early Angus, Berlin, Berlie, and the Sandy Oat. There is no Oat so shamefully treated as the Barbachlaw; when any mishap or neglect on the part of the farmer takes place, he covers that neglect by consoling himself that it is good enough for Barbachlaws, and no wonder, often produce a poor crop; but if sown upon good sharp soil, or tenacious clays in fresh condition, it will stand comparison with any other; and if the produce in grain and straw be honestly tested, in nine cases out of ten be declared the victor. The great change in the productiveness of the soil by extensive draining, has allowed the earlier varieties of Oats to be sown to great advantage, the Barbachlaws not exempted, and the later sorts have been gradually wearing out of cultivation. The earlier varieties of Oats prove more advantageous than the later ones for nourishing the young Grass plants; this of itself is a valuable recommendation when permanent pasture is intended, but when prices are so very low upon poor soils; where a scanty crop may be anticipated, it becomes a matter of grave consideration, whether a crop of Oats should be taken along with the finer Grasses. Any experiments I have tried corroborate this opinion, and if sown in the latter end of March or April, in ordinary seasons, will afford a good bite for sheep by the end of July, or middle of August, resists the alternate changes of the weather during the winter, and produces more luxuriant herbage in the next and following years; this may be said to shorten the supply of food for stock. Oats intended for seed should not be allowed to be too ripe before cutting, as considerable loss is sustained in all the various processes of manufacture, and if sown upon damp soils and ungenial climates, are apt to burst, especially if the seed has been grown in the neighbourhood of the sea-board; another reason why they should not be too ripe is their aptitude to sheel, by the powerful steamers so generally in use for threshing.—Mr. LAWSON then read a valuable paper on the variety of the Oat, which we must postpone.—The CHAIRMAN then remarked—As this is the last meeting of the season, I cannot allow you to separate without congratulating you, and the Highland Society in general, on the success which has attended these meetings. They are of great value, not only from the amount of practical knowledge which they elicit, but also from the opportunities they give for an interchange of kindly feeling among the members. I hope they will be equally successful next season, and that they will long continue to sustain the character and efficiency which have characterised them.

Farmers' Clubs.

NEWCASTLE, *October: Farming Accounts.*—Mr. WILLIAM ANDERSON, V.P., said: Farmers are frequently deterred from keeping regular accounts, from the idea that it would occupy too much of their time; but very little reflection will show them that the books are really not numerous, nor the quantity of writing so onerous, as they appear. Still, a certain number of books are necessary; and it is surely highly desirable for farmers to be able to tell whether they are gaining or losing by their business, so as not to allow their affairs to get into confusion; and if we can assist farmers who have not paid so much attention to the minutiæ of bookkeeping, and encourage them to keep accounts of some sort, some good will be obtained. To maintain that any farmer cannot find leisure to write a few lines in one, two, or three books, during the course of a whole week, is to maintain an absurdity. Perhaps I may mention the late Lord Barrington, who occupied a good deal of land in the county of Durham, and who took great interest in agricultural pursuits. When obliged to reside at Florence (on account of his health), his lordship had duplicates of his farm accounts and transactions forwarded to him every week, and he knew quite well everything done upon the farm. Upon one occasion he sent back to say that he observed that Robin Goodfellow, on a certain day, had been ploughing on the Ox Close half a day, and requested to know where he was employed the other half of the day; when the farm manager begged to apologise to his lordship for having omitted to mention that Robin had a christening in his family, and was allowed half a holiday on the occasion. It is not to the foregoing-mentioned class of farms, but to the class of small farms, of from 200 to 300 acres, of mixed husbandry, that I shall beg to direct the attention of the Club at present, and shall not further trespass on your time with any observations, but proceed to mention a few books, the smallest number that ought to be kept even on small farms: 1. The Journal, or Memorandum-book, will be found very useful for noting down temporary proceedings, to be afterwards copied at leisure into the proper books; noting down every sale, purchase, or engagement made in the way of business. 2. The Cash-book, where all sums of money paid and received are placed; of course, the sums received on one side, and those sums paid in the opposite page; and the book should be balanced at least once a week. 3. The Ledger. A farmer's transactions are mostly in ready money (and it is most desirable that they should be so), yet there must always be current accounts, as much business is still conducted on credit. Were it entirely on ready money, a ledger would be unnecessary. The ledger exhibits the state of every account as it stands between you and the person in whose name the account is opened—as the seed merchant, the guano dealer, &c. These accounts, if not closed within the year, the balance will have to be carried forward to the succeeding year. 4. The Pocket Cash-book, or Petty Cash-book. In this book are entered all payments and receipts as they arise, and which, if not put down at the time, might very probably be lost sight of. From this book the entries are to be transferred to the general cash-book at short intervals. A pocket cash-book is liable to be lost, and, of course, all account of the entries with it; but if entered in the general cash-book at home, there is a permanent record of them. This book will contain the petty expenses, such as tolls, postages, travelling and market expenses, and other small sums, which may be entered into the general cash-book in large sums, to save the columns of the cash-book being encumbered with so many small items. 5. A small book is quite essential to contain an account of all produce consumed in the farmer's house by his family—the amount at the year's end to be carried to the credit of the farm, less the amount expended in boarding farm servants in the farmer's house. 6. A General Account Book. It shows on the debtor side every expense that has been incurred on account of the farm, and on the creditor side the whole of the incomings or receipts; and, consequently, by balancing this book, the exact profit or loss of a farm may be ascertained. When a sale of farm produce is made on credit, it appears on the credit side of this account. An account is then opened in the ledger, in the name of the party to whom the sale has been made, charging the amount to their debit, and giving them credit for the same when paid. All monies received are placed also on the credit side, and cash paid on the contrary side. At the end of the agricultural year the ledger is carefully gone over, and the balance on every open account entered on a balance sheet. To these arrears is added the cash in hand, as shown by the cash-book: and the difference in the amount of these sums, and corresponding amount of the year the account is balanced, provided it is done at the same period in each year. As farms in this district are generally entered upon at May, that time, at the following May, will probably be found a convenient period; the more especially as the stock yard is usually much reduced by that time, and the winter-fed cattle disposed of. Of course all the stock of horses, cattle, sheep, pigs, &c., must be separately valued; as also any corn, hay, or other produce, of what kind soever, belonging to the farm. The corn saved for seed, and the implements, and also any credit balances in the ledger, must be placed on the credit side of the account. The amount of stock at the previous May, or other period of balancing, must be placed at the debit side of the account—and the balance of the cash-book, on such side of the account as may happen, according to the state of the account. The difference in amount between these columns will then be the sum gained or lost by the farmer during the last year. It would facilitate the ascertaining the quantity of corn at any time in the stack-yard, and be otherwise useful, if a plan of the stack-yard were kept, numbering the stacks, with remarks as to the quantity and quality of each stack.

BALANCE SHEET.

Dr.				Cr.			
May 12, 1849.				May 12, 1849.			
To stacks, as per valuation, May 12, 1848	£950	0	0	By Wheat, 500 bolls at 12s. per boll ...	£300	0	0
To ledger balances	100	0	0	By Barley, 200 do., at 8s. per boll ...	80	0	0
To balance of the cash-book	56	0	0	By Oats, 400 do., at 5s. per boll.....	150	0	0
Balance gained.....	204	10	0	By 10 horses	250	0	0
				By cattle	304	0	0
				By 120 sheep, at 20s. each	120	0	0
				By hay, 20 tons, at 4l. per ton	80	0	0
				By implements.....	56	0	0
				By seed corn saved	20	10	0
	£1310	10	0		£1310	0	0

Mr. Anderson having brought his paper to a close, resumed his seat amidst expressions of approbation.—Mr. G. H. RAMSAY, V.P., observed that the keeping of farming accounts, with any great degree of precision, was attended with many difficulties; but that was no reason why as near an approximation should not be made as possible; and as the farmer generally carried on a ready-money trade, that certainly rendered it easier for him to keep an account of his transactions. But it was very difficult for him to ascertain what sort of produce yielded the most profit. Buying oxen and sheep, and feeding them together, he could know little more than that he had paid so much for them, and sold them for so much more; it was impracticable for him to determine how much it had cost him to realise the increased value of each animal. Nor could he separate the amount of his domestic expenses, or say how much labour he got from his household in return for their maintenance. The farmer stood, in this respect, in a very different position to that of the merchant or the manufacturer. But, making every allowance for the peculiarity of their position, the farmers were undoubtedly much more careless accountants than they need be.—Mr. BROWN said he knew two farmers (we withhold their names), who farmed alongside of each other. One day they met on the boundary line, and had a crack with the fence between them. One of them said to the other, "They tell me thou keeps a b'yuik?" "Yes," was the reply, "I do." "Why," rejoined the first speaker, "aw keeps ne b'yuik, but aw always tak's care to hev a good balance at year's end." Now, the man who "kept a b'yuik" became bankrupt, and the other realised a fortune. He did not mean to say that the bookkeeper failed because he kept accounts; but, undoubtedly, desirable as it was to keep books, it was more desirable to have a balance in hand at the year's end.

Review.

An Account of the King's Somborne School. [Extracted from the Minutes of the Committee of Council on Education. 1847-8. R. Groombridge and Sons.

WE advise all who are interested in the education of the labouring population to procure this tract. It is the most interesting and encouraging report on such a subject that we ever read. Probably no one has ever undertaken the establishment or management of schools for the children of labourers in a country district without either ultimate and entire, or, at the least, periodical and partial disappointments, arising from the wearing out of that novelty which had at first given the appearance of so much prosperity, and from the withdrawal of the children at the busy periods of the agricultural year. Now, in the report of King's Somborne School, where no such periodical failures appear to occur, the causes of that seemingly small interest taken by labourers in the education of their children, to which these failures are attributed, are most usefully discussed.

"If our education," it says, "has failed of its results, if we find the poor but little benefited by our schools, careless of sending their children to them, and ready to take them away on the least chance of profitable employment, let us remember that they have themselves had no voice in the matter; that in the education we offer to their children, the springs of opinion among them have never been considered, nor their wants consulted. It is in this that the secret of Mr. Dawes's success appears to me to lie. He has shown his knowledge of the springs of opinion amongst the poor by consulting their independence, and adapted the education he offers to their wants, by a careful study of their condition. The King's Somborne school was commenced in the exercise of abundant faith in the affection of a labouring man for his children; and, notwithstanding that the wages of labour in the parish of King's Somborne are very low, the school fee was fixed at double that of other neighbouring schools, under the impression that he would be willing to pay more than is usually claimed of him for what he believed to be a really good and useful education, and that the higher fee would tend to create this belief in his mind."

And the fact is, that this school, situated in a poor and exclusively agricultural parish, where wages vary from 6s. to 9s. a week, where, excepting the rector, there is no person resident above the condition of the farmer, is wholly self supporting.

"The children buy their own books, and their fees pay the salaries of the teachers. No child is admitted to the school free of charge. No arrears of the school

fee are allowed. The following is the scale of payments: For the labourers' children, 2*d.* per week for one, and 1*d.* for every additional child in the same family. For the children of all those above the mere labourer, and whose parents are living in the parish, 6*s.*; and for those of a similar class out of the parish, 10*s.* per quarter. The school opened in October, 1842, with 38 children, of whom 11 paid by the quarter. The following Table exhibits its subsequent progress:

Years from the Commencement of the School.		Whole Number of Children.	Number of Children paying by the Quarter. From Somborne.	Number of Children paying by the Quarter. From other parishes	Sum received for Fees. £	s.	d.	Sum received for Books. £	s.	d.
1st	Year to Michaelmas. 1843	106	24	1	56	17	3	7	5	5
2d	1844	110	24	3	68	11	7	8	0	6
3d	1845	144	24	10	84	6	1	11	5	3

5th	1847	219	23	26	145	6	6	24	18	1

Mr. Dawes, the vicar of King's Somborne, has published several works on the subject of elementary schools and the education they impart; thus contributing by precept as influentially as in the instance before us he does by example, to the furtherance of this important matter. We shall be glad if the notice of his efforts in this journal shall spread the knowledge of them in any of the many quarters where imitation of them is desirable.

Calendar of Operations.

MARCH.

Dorset Farm, *March* 25.—If March dust still retains the value once attached to it, we ought to be enriched this year, for never has there been a drier month than the present; for we have not had any rain in it except on the 23d, when we had a slight rain, which terminated in a fall of snow. But although it has been dry it has been very cold, with sharp frosts at night, and vegetation is very backward; the pastures look worse now than they did a month ago. But work is very forward, and Barley sowing is far advanced by most, some having finished. We have finished ours, and are now getting the land intended for Mangold Wurzel and other roots prepared. We intend to sow a piece of Rape in the course of a week; it may be too early, but we sowed some about three weeks later last year which did very well. We have got part of our ewes and lambs in the water meadows, which get in addition to the Grass 1 lb. of oilcake each per day; these are preparing for the market. The rest of our flocks are eating Rape by day, and run in the Grass fields at night getting some Mangold Wurzel. The Wheat, on the whole, looks well; that which was sown early looks a little too thick, but the later sown is rather the reverse; a chief cause of it no doubt is, that it was sown when the land was too wet, which, forming a crust over the seeds, prevents it obtaining the benefit of the air, without which the seed will not germinate so quickly, and some of it will rot before it is able to push itself through the stratum of hard earth that covers it. Our work will now be ploughing and otherwise preparing the land for the different root crops. *G. S.*

Notices to Correspondents.

Bones and Acid: *F G.* We would dilute the superphosphate with vegetable mould, or old ashes, rather than with the dust of lime got from the kiln; this would reduce the soluble biphosphate to its original insoluble condition again.

Brewing: *Inexperience.* See last week's Paper on this subject. Probably the wort is not thoroughly fermented.

Landlord and Tenant: *A.* We cannot give answers to legal questions. The point should be referred to your solicitor.

On Packing Cheeses: *N P T.* The cheese should be packed in tin boxes fitting close to the cheese, and well soldered, so as to exclude the air. *J. W. H.*—Another says: "Lead or zinc is the best package for cheese sent to a tropical climate, and, as the material is saleable in all parts of the world, perhaps the cheapest."

Ornamental Poultry, by the Rev. E. S. Dixon, is now re printing, with additions, and will shortly be published, price 5*s.* 6*d*, cloth. May be had of all booksellers, and at the Office of this Paper.

Present Prices: *J R C.* If you would forward your address, we could explain satisfactorily. About fencing next week.

Stagnant Water: *B M T.* Its offensiveness is removed by throwing any charred matters into it.

Steam: *J D.* Will some one kindly name a work that will assist an amateur engineer in carrying out the use of steam to agricultural purposes, without danger? He has constructed an apparatus that answers admirably both as regards cheapness and efficiency in cooking cattle food; and wishes to be enabled to judge of its safeness by referring to some practical book on the strength of material used in boilers, &c. [Tredgold's book does not touch the point.]

To Correspondents: The answers to some of the inquiries received are unavoidably postponed for a week.

Markets.

SMITHFIELD, Monday, March 25.

We have not a large number of Beasts on offer to-day, sufficient, however for the demand. Trade on the average is slow, at about former prices. The supply of Sheep has increased; this being the last week in Lent very few are wanted, and it is with difficulty the choicest kinds realise last Monday's quotations. Trade is dull for Lamb; 6*s.* is the top price.

Per st. of 8 lbs.	s	d	s	d	Per st. of 8 lbs.	s	d	s	d
Best Scots, Herefords, &c.	3	6	to 3	8	Best Long-wools	3	6	to 3	10

					Pigs	3	0	— 4	0

Beasts, 3395; Sheep and Lambs, 22,050; Calves, 108; Pigs, 184.

Friday, March 29.

The supply of Beasts is not excessive; however, this being Good Friday, very few are wanted, some therefore remain unsold, but prices generally are about the same as on Monday. Although the number of Sheep is not large, it exceeds the demand; there is no disposition to take lower prices, and consequently some are not disposed of. Lamb is the only article which commands particular attention to-day. This is considered the commencement of the season. Considering Easter falls early this year and the extreme cold weather, the quality and quantity of the Lamb are quite equal to expectation. The sale of them also, under these circumstances, is satisfactory.

Beasts, 787; Sheep and Lambs, 7870; Calves, 266; Pigs, 100.

COVENT GARDEN, March 30.

Notwithstanding the severity of the weather, Vegeables are pretty well supplied, but many kinds of Fruit are still scarce. A few new hothouse Grapes have made their appearance. Pine-apples, though far from being plentiful, are nevertheless sufficient for the demand. Walnuts and Chestnuts are abundant; and Oranges and Lemons sufficient for the demand. Amongst Vegetables, Turnips and Carrots are good, and there is some fine Cornwall Broccoli in the market. Potatoes are unaltered since our last account. Lettuces and other salading are sufficient for the demand, and so are Mushrooms. French Beans, Asparagus, Seakale, and Rhubarb may be obtained at about last week's prices. Cut Flowers consist of Heaths, Pelargoniums, Bignonia venusta, Primulas, Camellias, Cinerarias, Azaleas, Lily of the Valley, Epacrises, Acacias, Lilacs, and Roses.

POTATOES.—Southwark, March 25.

The Committee report that the arrivals during the last week, both coastwise and Continental, are very considerable, and more than adequate to the wants of the trade, and it is with difficulty the following prices are realised:—York Regents, 70s. to 100s. per ton; Wisbeach do., 60s. to 70s.; Scotch do., 60s. to 65s.; Scotch cups, 50s. to 60s.; Scotch whites, 40s. to 45s.; French whites, 50s. to 65s.; Belgian do., 40s. to 55s.; Rhenish do., 40s. to 55s.; Dutch, 40s. to 45s.

HOPS.—Wednesday, March 27.

Messrs. Pattenden and Smith report that there is a firm and steady trade for the best coloured Hops, both of 1847 and 1848. The quantity of the new growth on hand is very small, and diminishes daily.

Mid. and East Kents ... p. cwt.	160s to 240s	Farnhams, p. cwt.	—s — —s

New Hay	— —		J. Cooper.

MARK LANE.

Monday, March 25.—The supply of English Wheat by land carriage samples from Essex and Kent was again a small one, and, the condition being good, it realised rather more money than on Monday last. For foreign Wheat there was a better demand, and an improved sale at the rates of this day se'nnight. Choice qualities of English Barley maintained their value, but secondary sorts of English, and all descriptions of foreign, must be quoted 1s. cheaper.—The arrival of foreign Oats during the past week have exceeded 29,700 qrs., and the display of samples being large the dealers and consumers were more free buyers than of late, and took off the bulk of the supply at a reduction of 6d. to 1s. per qr.—Beans a slow sale, at 1s. per qr. decline.—Peas maintained last week's prices.

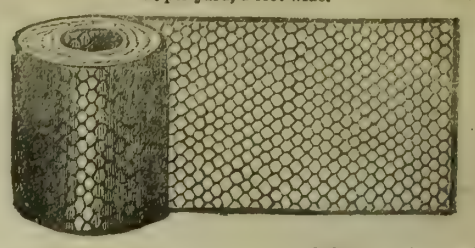
— Foreign ...per barrel	21	23	Per sack	28	33



Wednesday, March 27.—The attendance of buyers this morning was very small, and the business transacted of a very limited character. The few parcels of English Wheat on sale were disposed of at about Monday's rates. In foreign Wheat but few transactions took place, and its value underwent no change.—English Barley supported previous quotations.—The receipts of foreign Oats are again large, and late rates with difficulty maintained.—No change in Beans, Peas, and Flour.

Liverpool, March 28.—There has been no corn market held here since Tuesday. A steady business was going forward in Brunswick-street on Wednesday and Thursday, at full prices for every article of the trade, and the tone of the market is towards improvement. Good qualities of Flour are getting into a smaller compass.

GALVANISED WIRE GAME NETTING.—
7d. per yard, 2 feet wide.

	Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide ...	7*d.* per yd.	5*d.* per yd.
2-inch ,, strong ,, ...	9 ,,	6½ ,,
2-inch ,, extra strong ,, ...	12 ,,	9 ,,
1½-inch ,, light ,, ...	8 ,,	6 ,,
1½-inch ,, strong ,, ...	10 ,,	8 ,,
1½-inch ,, extra strong ,, ...	14 ,,	11 ,,

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

CROSSKILL'S PATENT ROLLER.—For Rolling Spring Wheat, Growing Crops, Grass Lands, Compressing Soft Soil, and Crushing Clods. Prize Patent Wheels, Carts, and Waggons—awarded 30 sovs. prizes at Norwich. Prize Portable Farm Railway, will pay its cost the first year, &c. &c. On receipt of six penny postage stamps, a new Illustrated Newspaper and Catalogue will be sent gratis per post, with full particulars of the newest and best Field, Road, and Barn Implements, now kept in Stock, for delivery from Hull by water or rail to all parts of the kingdom.

Address Mr. Crosskill, Iron Works, Beverley.

IMPORTANT TO AGRICULTURISTS.—COLLECTION AND DISTRIBUTION OF MANURES.

STRATTON'S AGRICULTURAL REPOSITORY, BRISTOL.

STRATTON, HUGHES, and CO., have now ready their PATENT TUMBLER CART for the collection of Night-soil and other offensive matters; also their Iron Mill, to be worked by horse-power, water-power, or steam, for mixing and incorporating Nightsoil with Charcoal and other deodorisers. The Tumbler Cart has an iron body with a close cover; can be fitted if required as a Watering-cart, with a Valve and Delivery Pipe for distributing water or liquid manure, and also with an Apparatus for distributing dry manures in any given quantities per acre.

Stratton, Hughes, and Co.'s Tumbler Carts are used for scavenging purposes in Manchester, Bristol, Worcester, Harwich, Rochford, Cardiff, &c., and they are now building them for Chester, Oxford, Huddersfield, &c., besides many for Agricultural Colleges and private individuals. Stratton, Hughes, and Co.'s new illustrated Catalogue of Carts, Waggons, and Agricultural Implements will be forwarded to any address on receipt of 1*s.* 6*d.* in postage stamps.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

CROGGON'S PATENT ASPHALTE ROOFING FELT has been extensively used and pronounced efficient, and particularly applicable for warm climates.

1st. It is a non-conductor.

2d. It is portable, being packed in rolls, and not liable to damage in carriage.

3d. It effects a saving of half the timber usually required.

4th. It can be easily applied by any unpractised person.

5th. From its lightness, weighing only about 42 lbs. to the square of 100 feet, the cost of carriage is small.

Price One Penny per Square Foot.

CROGGON and Co.'s. PATENT FELTED SHEATHING for COVERING SHIPS' BOTTOMS, &c., and NON-CONDUCTING FELT for STEAM BOILERS, PIPES, &c., preventing the radiation of Heat, and saving 25 per cent. of Fuel.

Samples, testimonials, and full instructions, on application to Croggon and Co., 2, Dowgate-hill, London.

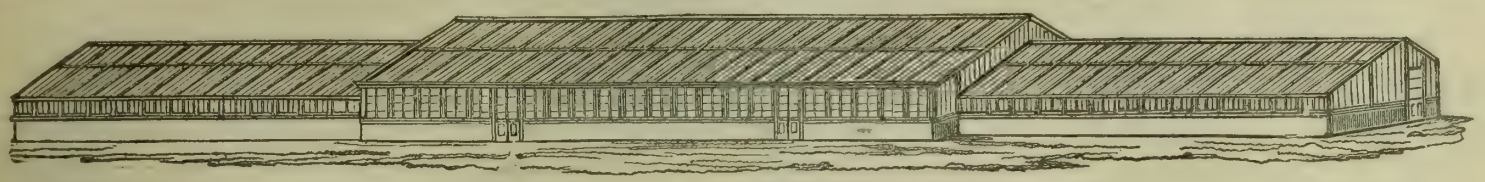
ALLSOPP'S BURTON and EAST INDIA PALE ALES.—Messrs. S. Allsopp and Sons beg to call the attention of the public to their East India, Pale, and other Burton Ales, which may be obtained in casks of 18 gallons and upwards, either singly or in any quantity, by application to the Brewery, Burton-on-Trent, or on the same terms at their respective Stores, as follows:—61, King William-street, London; Cook-street, Liverpool; under the Exchange, Ducie-place, Manchester; and at the Market-place, High-street, Birmingham.

AUSTRALIA, NEW ZEALAND, CAPE of GOOD HOPE, NATAL, &c.

PASSENGERS to the COLONIES generally may obtain their OUTFITS from S. W. SILVER and CO., CLOTHIERS, &c., 66 and 67, CORNHILL, at wholesale prices. SILVER and CO. make nearly the whole of the articles comprised in an outfit, to secure durability, so that the Cabin Folding Furniture may become permanent Household Furniture on arrival in the colony.

They also engage PASSAGES, and give ship sailing INFORMATION, but they neither receive nor pay a commission—their object being to give PASSENGERS who place themselves in their hands every benefit; and they forward small packages for their customers (gratis) through their AGENTS in the COLONIES.

SILVER and CO. give DRAFTS on AUSTRALIA at sixty days' sight of 103*l.* for every 100*l.* paid here.



The EMIGRANT Fitting-out Branch is at No. 4, Bishopsgate-street, opposite the London Tavern, where a comfortable fit-out for male or female, including bedding, may be obtained for FOUR POUNDS.

A Branch of each at ST. GEORGE'S-CRESCENT, LIVERPOOL.

GRAY, ORMSON, AND BROWN,

DANVERS STREET, CHELSEA,

Respectfully solicit the attention of the Nobility and Gentry to their superior manner of Erecting and Heating every description of Building connected with Horticulture. They have much pleasure in giving the following testimonial referring to the range of houses shown below.

Peach House, 30 by 16 feet. | Vinery, 30 by 16 feet. | Stove, 45 by 20 ft. | Greenhouse, 45 by 20 ft. | Vinery, 30 by 16 ft. | Vinery, 30 by 16 ft.

[Erected for John Shaw Leigh, Esq., Luton Hoo.]

Extract of a Letter from Mr. Fraser.—"I have much pleasure in expressing my entire satisfaction with the range of houses you erected here. I may also state that my honoured employer, John Shaw Leigh, Esq., is perfectly satisfied. I have no hesitation in stating, that to the best of my knowledge, there is not a more complete range of glass in the country, as regards both building and heating. I may add that they are admired by every Gardener who has seen them. I shall have much pleasure in answering any references you may please to direct.

(Signed.) "James Fraser, Gardener, Luton Hoo Park."

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS will submit to public competition by Auction, at the Mart, Bartholomew-lane, on WEDNESDAY, April 3, and THURSDAY, April 4, at 12 o'clock each day, a first-rate collection of Carnations, Picotees, and Auriculas, selected Standard and Dwarf Roses, choice Dahlias, Fuchsias, Verbenas, Pæonia; also a few Camellias well set with bloom buds, &c.—May be viewed morning of sale. Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GARDENERS, SEEDSMEN, AND FLORISTS.

TO BE LET, with immediate Possession, an old established Concern in the principal and most fashionable thoroughfare in Brighton, the Western Road; comprising the Seed, Fruit, and Florist Business, with excellent Vinery, Show-house, and Stove. In-coming moderate.—Apply to Messrs. Rogers and Ayling, Nurserymen, Withdean, near Brighton.

CUCUMBER AND MELON BOXES AND LIGHTS.

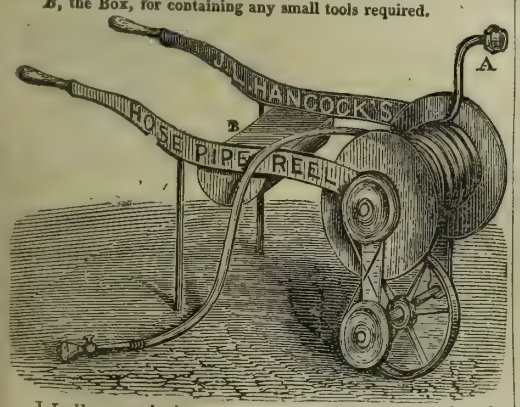
One hundred 1, 2, and 3-light Boxes and Lights of all sizes ready for immediate use. Warranted best materials, packed and sent to all parts of the kingdom; 2-light Boxes and Lights from 1*l.* 4*s.* Garden Lights of every description. Conservatories, Green and Hot-houses, made and fixed in all parts of the kingdom. References given to the Nobility, Gentry, and the Trade, in most of the counties of England. Jas. Watts, Hothouse Builder, Claremont-place, Old Kent-road, London.

IMPORTANT TO DRAIN TILE AND PIPE MANUFACTURERS.

SMART AND CREWTHERS beg to intimate that they are now prepared to send out their newly-invented Machine for the Manufacturing of DRAIN TILES and PIPES; these Machines have been fairly tested in Northumberland and Berwickshire, and are allowed to be the best yet produced.—For particulars apply to Messrs. Wm. Wilson and Son, Ironmongers, Bridge-street, Berwick-on-Tweed.

Testimonial.—"Gentlemen,—After working your Machine for five months, it is the best Machine I have ever had or seen,—we are making 10,000 per day.—George Phillips, Flodden Tile Works."

PATENT SPADES, DAISY RAKES, SCYTHES, Draining, and other Garden Tools. Mole Traps, 6*s.* per dozen. Carpenters and Smiths' Tools, &c. Ladies' Garden Tools, 7*s.* 9*d.* a set. Sword-scrapers for Gardens, 1*s.* 2*d.* each. Dr. Arnott's Ventilating Chimney-valves, plain 5*s.*; Ornamental ditto for Drawing-rooms: at J. H. Boobbyer and Co.'s (late Sturch and Boobbyer), Ironmongery, Brass-foundry, Nail and Tool Warehouse, 14, Stanhope-street, Clare-market, London. Established nearly 200 years for the sale of goods from the best Manufactories at the lowest prices. Goods forwarded to any part on the receipt of remittance.



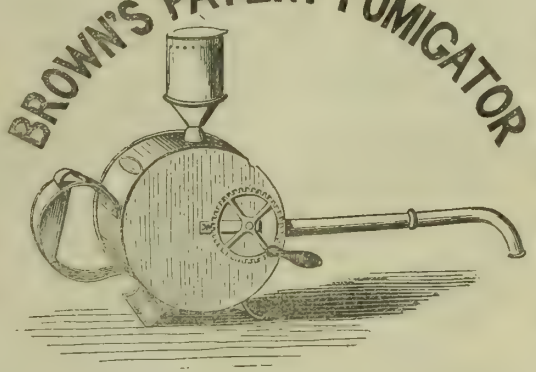
FLEXIBLE INDIA-RUBBER HOSE PIPES.

JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING. These Pipes are well adapted for watering Gardens, conveying Liquid Manure, for Breweries, Gas Fittings, Chemical and all purposes where a perfectly sound Waterproof and Flexible Pipe is required. Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently flexible in all temperatures, and are therefore particularly suitable for Fire-Engines; and from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes. Being extremely portable, stowing closely without danger of injury, resisting the influence of climate, insects, and vermin, frequently so injurious to such articles on board ship, and retaining their virtues though long out of use, render them particularly adapted for exportation.

N.B.—VULCANISED INDIA-RUBBER GARDEN HOSE, fitted with Roses, Jets, and Branches, complete, with Union Joints, ready to attach to Water Cisterns.

A, represents the Union-joint, for effecting the communication between the Hose-reel and the Tank, or Reservoir.

B, the Box, for containing any small tools required.



J. L. Hancock invites attention of parties using long lengths of the Flexible Garden Hose, to his SELF-ACTING HOSE PIPE REEL, which is found a most convenient machine for winding up and conveying away the Hose when out of use.

All letters or Orders addressed to J. L. H. at the Manufactory and Warehouse, Goswell-mews, Goswell-road, London, will meet with immediate attention.

PRICE TEN SHILLINGS AND UPWARDS.

A PORTABLE INSTRUMENT, FOR FUMIGATING GREENHOUSES, STOVES, and FRAMES, OR SHRUBS & FLOWERS, IN THE OPEN AIR,

Without injuring the most Delicate Plant;

Delivering the smoke cool, in a dense mass, and effecting a great saving of Tobacco.

MANUFACTURED AND SUPPLIED to the TRADE BY MESSRS. BARBER and GROOM, LONDON;

And may be had of all IRONMONGERS, SEEDSMEN, AND FLORISTS.

DR. NEWINGTON'S HAND-DRILL HOES, with their various fittings; Hand-Dibbles, with from 6 to 9 depositors each, Wheel-Dibbles, Drop-drills, and Hand-sowing Implements for dropping seed at defined intervals in the seams of the plough, or in pressed land, or in drills. A Prospectus and Lecture on Seeding sent gratis on application to Messrs. Dufaur and Co., Agricultural Depôt, 21, Red Lion-square, Holborn, London. The above Dibbles received the prize given by the Royal Agricultural Society at Norwich.

FARMING IN SCOTLAND.—A Gentleman farming upwards of 500 acres of land, in one of the best districts of East Lothian, can accommodate one or two gentlemen who are desirous of gaining an intimate knowledge of practical agriculture. The house is commodious and finely situated, within two miles of a railway station; there is a also a large garden, vineries, &c. References given and required. For further particulars, application may be made to William Alexander, Esq., W. S., Register-street, Edinburgh; or Thomas Burn, Esq., Solicitor, Sunderland.—March 30.

DEANE'S WARRANTED GARDEN TOOLS.—Horticulturists, and all interested in Gardening pursuits, are invited to examine G. and J. Deane's extensive Stock of GARDENING AND PRUNING IMPLEMENTS, best London made Garden Engines and Syringes, Coalbrookdale Garden Seats and Chairs.

Purified by steam, and warranted sweet and free from dust.—Heal and Sons' List of Bedding, containing full particulars of weights, sizes, and prices, sent free by post, on application to their Factory, 196, Tottenham-court-road, London.

NEWS, NEWS, NEWS.—The best, cheapest, and largest Newspaper in the World.—LLOYD'S WEEKLY LONDON NEWSPAPER contains 60 large columns of the latest intelligence from all parts of the Globe, price only Threepence, postage free. Send Three Postage Stamps to E. Lloyd, 12, Salisbury-square, London, and receive one copy as a sample.

LINGHAM BROTHERS, 170, Hampton-street, Birmingham, sole Manufacturers of the improved WOOD and ZINC MENOGRAPH, or Label for Garden Borders, Flowerpots, &c., in boxes of 100, &c. The Zinc Labels are highly approved of for their lasting durability; can be written upon with the greatest ease, and, when dry, a permanent inscription is secured. Directions for use sent with each box, including bottle of Metallic Ink.

Sole agents in London, G. and J. Deane, Horticultural Implement Warehouse, 46, King William-street, London-bridge.

STEPHENSON and Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

WIRE STRAND FENCING, as fixed by R. S. NEWALL and Co., is cheaper, stronger, more durable and elegant than any other Fence hitherto introduced.

COPPER WIRE HOTHOUSE SASH LINE.
LIGHTNING CONDUCTORS.
GILT AND PLATED CORD FOR HANGING PICTURES.

Office, 130, Strand, London; Warehouse, Brunswick-street, Blackwall; Manufactory, Gateshead, on Tyne.

PROTECTION FROM FIRE.—Fire Annihilator Company.—MACHINES of various sizes, suited for rooms in private houses, for shops, or for cabins, or holds of ships, are now on SALE; larger machines are made, adapted for warehouses, factories, and extensive premises. Particulars and estimates, and cards for witnessing demonstrations of powers of the invention, may be had at the office, 105, Leadenhall-street, London.

THE IMPERIAL COVERLETS, now so universally admired and appreciated, as a Cheap, Durable, LIGHT, Warm, and Elegant COVERING for the BED, can be had, Wholesale and Retail, of W. H. Batson and Co., 1, Princess-street, Manchester; and 499, Oxford-street, London.

"I disapprove exceedingly of thick heavy Quilts and Counterpanes; they should always be avoided, especially by invalids, as they irritate delicate frames and prevent sleep."—*Dr. Graham's "Domestic Medicine,"* pages 192, 729.

MARQUEES, SUN-BLINDS, RICK-CLOTHS, &c.—Manufactory, Old Kent-road (facing the Bricklayers' Arms Railway Terminus), and 17, Smithfield-bars, London.

The guests are arriving; my villa has got
Quite a park-like appearance—a beautiful spot;
The band on the lawn, in the spacious marquee;
This tent for our dinner and that for our tea.

Marquees and temporary rooms superbly fitted up for Fêtes, &c., on most moderate terms, by Thomas Edgington and Co., Tents of every description, Rick Cloths with Poles, &c. Tanned Netting, for the protection of fruit trees from frost, blight, and birds, and for the security of fresh sown seed, either in gardens or fields, at unprecedented low prices, viz., 1*d.* per square yard, or 200 yards for 14*s.*, or 500 yards for 30*s.*, or 1000 yards for 50*s.* Gardeners and shopkeepers supplied by the cwt. New Archangel Mats and Scrim Canvas for wall fruit. Tarpaulings for houses under repair or hire. Orders and inquiries per post immediately attended to.

A DANGEROUS WOUND IN THE THIGH CURED BY HOLLOWAY'S OINTMENT AND PILLS.—About three years ago, Mr. Acton, of Melbourne, had his thigh most fearfully lacerated when out riding, his horse running away and his leg coming in violent collision with a wall. He was confined to his bed for nearly 18 months' suffering from the accident, and notwithstanding the best medical advice every effort proved unsuccessful in healing the wound, and his health became so impaired that his life was despaired of; in this state he commenced using Holloway's Ointment and Pills, which had the effect of healing the wound with wonderful rapidity, and restoring him to sound health.—Sold by all Druggists, and at Professor Holloway's Establishment, 244, Strand, London.

JOHN KERNAN

4, GREAT RUSSELL STREET, COVENT GARDEN, 1850.

Begs to offer a Select List from his

Ornamental Trees and Shrubs of all descriptions.
Cedrus Deodara, Cryptomeria japonica, Taxodium sempervirens, } 2*s.* 6*d.* to 10*s.* 6*d.* each.
Named Double Anemones and Ranunculuses; Gladiolus ramosus and floribundus; Tigridia pavonia and conchiiflora; with many other flowering Bulbs and Herbaceous Plants, which may be planted out till the middle of May.
Carnations, Picotees, and Pinks, per pair, from 1*s.* to 3*s.* 6*d.*
All the better named Heartsease from 6*s.* to 30*s.* per dozen.
Fine named Dahlias, per dozen, 12*s.*
,, Chrysanthemums, new kinds, 12*s.*
Standard Dwarf and Climbing Roses, 1*s.* to 2*s.* 6*d.* each.
Rivers' Miniature Fruit Garden, with directions for culture and root-pruning, 2*s.*
Rivers' new edition of the "Rose Amateur's Guide," 6*s.*
Paxton's "Cottagers' Calendar," 3*d.*, which ladies and gentlemen should distribute to cottagers.
Collection of 24 Annuals, mixed, recommended by Dr. Lindley as suitable for Shrubberies, 5*s.*
Seeds for distribution by Gentlemen to their Tenants and Cottagers on the most liberal terms.
24 papers of Hardy Annuals, 5*s.*
Seeds selected and carefully packed for North and South America, India, New Zealand, and Australia, in the most secure way to arrive safe at any of the above places.

Where a post-office order accompanies an order for any of the above-named Seeds, J. KERNAN will allow, as discount, additional articles to the amount of 2*s.* in the pound.

Ladies and Gentlemen relying upon the judgment and experience of JOHN KERNAN, instead of being supplied (as is often the case) with what is neither useful nor ornamental, may depend upon having a selection of the most useful and indispensable Vegetables to the amount named, by the parties forwarding him their orders. The same economy will be observed in the choice of Flower Seeds. J. K. feels it almost needless to observe that the liberality of discount will be with the amount.

Old meadow turf, which will take a considerable time to decompose and char by the regular or natural means, may be produced by the following simple and short process. Place four bricks, raised two on two, about 3 feet distant from four others similarly arranged, upon which place a sheet of iron large enough to rest fully on the bricks. By making a fire under this simple machine, and allowing your turf to remain until charred, it will, when bruised, make an excellent stimulant for Annuals, Herbaceous and Pot Plants of all sorts. If the vermin or the season do not disturb them, you will not require more than one plant in a hundred of those that come up. Be careful to begin thinning when the plants are quite young.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn-place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the County of Middlesex, Printers, at their office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said county, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, MARCH 30, 1850.

HORTICULTURAL SOCIETY OF LONDON.—The EXHIBITIONS OF FLOWERS, &c., in the Society's Garden, will take place on the following SATURDAYS, viz.: May 18, June 8, and July 13. TUESDAY, April 23, *is the last day* on which privileged tickets, at 3*s.* 6*d.* each, are issued to Fellows of the Society. Every Fellow is entitled to 2½ such tickets, if paid for on or before that day.—21, Regent-street.

ROYAL BOTANIC SOCIETY, Regent's Park.—GENERAL EXHIBITIONS, WEDNESDAYS, MAY 8th, JUNE 12th, and JULY 3d.

AMERICAN PLANTS.—SATURDAYS, May 25 and June 1. Tickets to be obtained at the Gardens, by orders from Fellows of the Society, price, on or before Saturday, April 27, 4*s.* each; after that day, 5*s.*; or on the days of Exhibition, 7*s.* 6*d.* each; and such Tickets will admit to the Collection of American Plants, from the 3d of June to the 8th, both included.

N. B. Fruit will be exhibited on June 12 and July 3.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.
UNDER THE PATRONAGE OF HER MOST GRACIOUS MAJESTY THE QUEEN.

THE FIRST EXHIBITION for the Season will be held in the Assembly Rooms at the HORNS TAVERN, Kennington, on WEDNESDAY, April 17, 1850 (open to all Exhibitors), when Prizes will be awarded for the following productions, viz.:—Miscellaneous Plants, Azaleas, Cinerarias, Auriculas, Hearts-ease, Polyanthuses, and Specimen Plants; in addition to which, a Silver Cup, value 5*l.* 5*s.*, presented by the Committee, will be awarded for the best collection of Miscellaneous Plants, by Mr. Wm. Ivery. For the best 8 Cinerarias, in pots, small Silver Victoria Medal, by Mr. H. Chapman. For the 2d best ditto, small Silver Albert Medal, by R. W. Dutton, Esq. For the best 3 Plants of Oliver's Lovely Ann Auricula, small Silver Albert Medal. And by the Proprietors of the "Gardener's Hive," for the best Seedling Cineraria (not sent out), the Hive Medal, value 10*s.*

Mr. Oakey's band will be in attendance. Admission to Non-Members, from 1 to 6 o'clock, at 1*s.* each. List of Prizes, and the Rules of the Society, may be obtained from

JOHN TAYLOR NEVILLE, Secretary.
Ebenezer House, Peckham, Surrey.

WARWICKSHIRE HORTICULTURAL EXHIBITION.—ROYAL LEAMINGTON SPA.

The First GRAND HORTICULTURAL EXHIBITION, open to all England, is fixed to take place on WEDNESDAY, June 12, 1850, at the Jephson Gardens, Leamington, under the especial patronage of many of the resident Nobility and Gentry of the county of Warwick, when prizes will be awarded on the most liberal scale for Stove and Greenhouse Plants, Geraniums, Roses, Fuchsias, Pansies, Pines, Grapes, and various miscellaneous productions, a Schedule of which may be had on application to Mr. OWEN WHITE, Honorary Secretary, Jephson Gardens and Parade, Leamington, and is advertised in the "Horticultural Magazine" for April.

The Second Grand Horticultural Exhibition is fixed for Wednesday, August 28, 1850.—Jephson Gardens, April 6.

UNEQUALLED NEW SEEDLING ANTIRRHINUMS.

ROBERT WHIBLEY begs to refer the reader to his Advertisement of the 9th of February last.
Nursery, Kennington, London.

JAMES WHOMES, Royal Pelargonium Nursery, Windsor, can supply fine Plants of HOYLE'S "CRUSADER" GERANIUM at 36*s.* per dozen; and every other fine variety equally cheap.—April 6.

MAIZE CORN, grown by a farmer, with the same cultivation as for Peas or Beans, with instructions for growing it. It has produced 60 bushels per acre in the cold wet summer of 1848, and 64 bushels in 1849. The above may be had at Mr. BENNETT'S, Centre Avenue, Covent-garden.

NEW FUCHSIAS, CHEAP, CHEAP!—Twelve of the following splendid new FUCHSIAS for 12*s.*; Six for 7*s.* 6*d.*, post free, viz.:—Alboni, Chateaubriand, Caractacus, Elegantissima, Elegans, Fire-king, Gem of the West, General Negrier, Lord Nelson, Model, Newtonensis, Perfection, Sapphire, Splendida, Sir C. Napier, Isabella, President, and Gem; if including Spectabilis, 15*s.* per doz. Strong plants sending out. The finer older varieties at 5*s.* per dozen. It is requested that all orders be prepaid. Apply to HENRY WALTON, Edgend Marsden, near Burnley, Lancashire.
Descriptive priced Catalogues for one stamp.

VERBENA—"WONDERFUL."

G. MOORE begs to refer the Readers of this Paper to his Advertisement of the 2d of February.
Perry Barr, near Birmingham, April 6.

" propendens	1	4 —	6	0

The above plants are all fit for exhibition, and are in every respect first-rate. Of the plants marked thus (*) not less than six will be sold. Further particulars and the price will be supplied by W. P. AYRES, as above.—April 6

STORY'S SUPERB SEEDLING FUCHSIAS.—2-48 SOUTH DEVON.—A very distinct and elegant flower; tube and sepals light rosy crimson, long and well reflexed, showing a most compact elegantly formed light blue corolla. The flowers are produced on long footstalks and in great abundance. This is a most distinct variety, and one that will give satisfaction to purchasers.—Strong plants, 7*s.* 6*d.*

* 3-48 DUPLEX.—A most remarkable variety, from its invariably producing a double rich deep purple corolla. The tube and sepals are bright scarlet, well reflexed, of good substance. It is a dwarf, compact grower, and an abundant bloomer. It will be a general favourite.—Strong plants, 10*s.* 6*d.*

6-48 MULTIPLEX.—This, as the name designates, is another double corolla flower, but perfectly distinct from Duplex. The tube and sepals are bright crimson, and well reflexed, shewing to a great advantage the intense purple corolla, which, for doubleness, resembles a large double Violet. It is a very free bloomer, and a variety that was greatly admired by those parties who saw it in flower.—Strong plants, 10*s.* 6*d.*

7-48 IGNEA.—A most splendid flower of extra size, and extraordinary brilliancy, both in its crimson tube and sepals, and deep purple corolla. The tube is long, symmetrical, and of great substance, without excrescence of any kind. Sepals sufficiently reflexed to show to advantage its beautifully formed corolla. It is certainly a first-class flower, and warranted to give satisfaction.—Strong plants, 10*s.* 6*d.*

* 8-48 UNIQUE.—This is a beautiful flower, of large size; tube and sepals bright glossy scarlet, of great breadth and substance, without the least wortiness or roughness of any kind. Corolla deep purple and well formed. A most abundant bloomer, two flowers being produced at the axil of the leaves. In the "Florist" for September and November last, it is highly commended, and described as a "very fine flower." The habit of growth and blooming is excellent. It is altogether a first-rate flower, and strongly recommended.—Strong plants, 10*s.* 6*d.*

9-48 MIRABILIS.—A great favourite with those parties who saw it in bloom. An early bloomer, tube and sepals scarlet, well formed and reflexed, corolla fine lively purple, bell-shaped, a most abundant bloomer, and a striking plant. Habit and foliage very good; a most distinct variety.—Strong plants, 7*s.* 6*d.*

* 11-48 STRIATA.—A most novel variety. The corolla which is crimson, being singularly striped with purple like a flake Carnation. It is an abundant bloomer, and invariably comes true to its striped character. It was much admired when in flower.—Strong plants, 7*s.* 6*d.*

The three sorts marked thus * are figured in "The Florist," for March last. The set of seven for 2*l.* 10*s.* for cash (prepayment). A selection of either four for 1*l.* 15*s.* for cash (prepayment.) The usual discount to the trade.

Messrs. VEITCH and SON have much pleasure in offering the above beautiful FUCHSIAS. They are Seedlings raised in 1848, and proved in 1849, by W. H. Story, Esq., of Whitehill, Newtown Bushell, and were selected from a vast number of Seedlings. They are all perfectly distinct, and worthy of general cultivation. Mr. Story's well-known character as a raiser of Seedlings will be a sufficient guarantee that he would permit nothing to be sent out with his name attached that was not of first-rate character, and calculated to give satisfaction.

Strong well-established plants will be ready for delivery on and after Monday the 15th of this month.

N. B. A remittance or reference from unknown correspondents required; this will be strictly adhered to.
Exeter, April 6.

MEETINGS AT WORTON COTTAGE, ISLEWORTH, for the Display and Examination of SEEDLING FLORISTS' FLOWERS, and other objects of Horticultural Interest.

The Editor of the FLORIST AND GARDEN MISCELLANY particularly requests that all Seedlings for the opinions of the Censors of that work may be posted, as far as practicable, so as to reach Mr. BECK, Isleworth, Middlesex, on the Wednesday morning of each week. Parties desirous of attending personally with their productions, by taking the 4.35 o'clock train for Isleworth from the Waterloo Station, will be put down within a few minutes' walk of Worton Cottage.

The next Meeting will be held on Wednesday, April 10th, and each succeeding Wednesday, at 5 o'clock, P.M.

An Artist will attend these Meetings, to take coloured memoranda of anything particularly striking.

N. GAINES begs to inform the admirers of Fancy GERANIUMS, he intends sending out on Monday next the following Seedlings: Gaines's Farodi, Lady Louisa Cornwallis, Elegans, Priam, Nina, Queen Superb, Signora Carolinii, Oderata variegata; also he has good strong plants of his Hero of Surrey and Cerise Unique.

On the 1st of May will be ready for delivery, his superb new Seedling DAHLIAS Lady Auckland, Empress of Yellow, Lord Hardinge, Fancy do., Princess Louisa, Hero, Desdemona, Rotundiflora, and Atalanta. Opinion of this Paper (1849), see August, No. 34; September, No. 38. Gardeners and Land Stewards' Journal, August, No. 32; September, No. 35.—A Descriptive Catalogue of the above, including Calceolarias, Dahlias, Pelargoniums, Fuchsias, Cinerarias, Chrysanthemums, Azaleas, Verbenas, Rhododendrons, &c., may be had by applying at the Nursery, Surrey-lane, Battersea, April 6.

GREENHOUSES, SUMMER HOUSES, &c.—Gentlemen wishing to have the above done by contract, and thus saving fifty per cent., can be supplied with design and specification for One Guinea, on application to W. SOANE, 28, St. John-street, River-lane, Islington.

SPLENDID NEW PETUNIAS (strong plants will be ready the last week in April).

EXQUISITE.—Peach, veined and striped with carmine, rich purple throat, most profuse bloomer. 2*s.* 6*d.*

KING OF CRIMSONS.—Very rich and velvety crimson, with dark throat, first-rate form. 3*s.* 6*d.*

MAGNUM BONUM.—Rosy purple, of extraordinary size and substance, extra fine. 3*s.* 6*d.*

MRS. BOWLES.—Bright pale lilac, suffused with crimson stripes, large dark throat, splendid form. 3*s.* 6*d.*

QUEEN OF ENGLAND.—Rose, veined throughout with crimson, large and conspicuous purple throat, first-rate form and habit. 3*s.* 6*d.*

The above were selected from a large number of Seedlings, and are warranted as described.

Orders addressed to MISS H. STEWART, Salt-hill Nursery, Slough, will be received thankfully, and punctually attended to. The usual allowance to the trade by taking the set, or three plants of a sort.

A Descriptive Catalogue of Fuchsias, Verbenas, Petunias, Chrysanthemums, Cinerarias, Shrubby Calceolarias, Dahlias, Antirrhinums, Phloxes, Hollyhocks; with Priced Lists of Geraniums, Greenhouse Plants, Hardy Perennials, Azaleas, Hybrid Rhododendrons, &c., may be obtained on application, inclosing six postage stamps, about the middle of April.

Salt-hill Nursery, April 6.

This Advertisement will not be repeated.

CHOICE SEEDLING PETUNIAS.—We have the pleasure to offer the following varieties of our own raising, which have been selected as first-rate from a large number of other Seedlings, and we trust will give equal satisfaction to the varieties we have hitherto sent out. To be sent out on April 20.

Magnificent, a fine rich crimson, colour and shape of "Brilliant" sent out last year, but having darker veins	5*s.* 0*d*
Castor, a large and distinct lilac, with a very rich dark purple throat	3 6
Pollox, a large silvery blush, with a dark rich purple throat	3 6
Orion, a rich lively crimson lake, of fine form	3 6
Syren, pure white, with a rich bright pink throat, good round form	3 6
Cassandra, French white, lilac pink throat, veined, edges of the corolla blotched with lively pink, large and fine	3 6

The usual allowance to the trade by taking the set, or for three plants of a sort.

12 new varieties of last season	12 0
12 superior varieties	9 0
12 fine ditto	5 0
25 varieties in choice assortment	15 0

The above free by post if required.

BASS AND BROWN,
Seed and Horticultural Establishment, Sudbury, Suffolk.

THE FINEST CARNATIONS, PICOTEES, AND PINKS, &c. &c.

YOUELL AND CO.'S Extensive and Celebrated Collection of the above are this season unusually strong and healthy, and are ready for sending out, in fine well-rooted plants, to any part of the United Kingdom, or for exportation, at the following prices:

25 pairs of finest first-rate show varieties of Carnations and Picotees	£5 0 0

J. G. WAITE, Seed Establishment, 181, High Holborn, London.

WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

WM. WOOD AND SON are now issuing copies of their new CATALOGUE OF STOVE AND GREENHOUSE PLANTS, to which is added Descriptive Lists of all the newest Camellias, Cinerarias, Fuchsias, Verbenas, Petunias, and Chrysanthemums, with a very extensive collection of plants adapted for bedding.

W. W. and S. have a large stock of Dwarf Roses in pots. April and May are the best months for planting out the above. They will be supplied as under, the selection being left to themselves.

Hybrid Perpetual and Bourbon Roses	12*s.* to 18*s.* per dozen.
Tea-scented and Noisette do.	12*s.* to 18*s.* "
China and Climbing do.	9*s.* to 12*s.* "

Catalogues will be forwarded, GRATIS, on application.

NEW PHLOXES.

ROBERT M. STARK, Edgehill Nursery, Edinburgh, begs to intimate that he is now prepared to send out the undermentioned seedling PHLOXES, raised by R. Girdwood, Esq, F.C.H.S. They were exhibited, and awards made to several, at various shows last summer. Among other enconiums, Mr. G. was congratulated on his "unexampled success in raising such a batch of seedlings" by the Floricultural Editor of the "Gardeners' Journal." The descriptions below are in part extracted from that paper of August 4.

In form the pips are all finely circular, limbs flat and smooth, and of proper thickness.

CLEOPATRA.—"An exquisite bloom; form perfect; colour, pearl white; eye distinct." 3*s.* 6*d.*

DIANA.—"Form excellent; colour lilac blush; eye circular." 3*s.* 6*d.*

EDGEHILL BEAUTY.—"Nice white flowers; petals not very large, but a noble trusser, and very attractive flower." 2*s.* 6*d.*

GIRDWOODII.—"Very pretty thing; ground colour lilac, shaded to white; eye distinct; size large." 3*s.* 6*d.*

JOAN.—"Form good; colour bright lilac, inclining to purple at the centre; large." 3*s.* 6*d.*

MIRABILIS.—"Form desirable;" colour pale lavender; eye circular. 2*s.* 6*d.*

RADIANCE.—"Colour lilac blush; a fine trusser." 2*s.* 6*d.*

SNOW-FLAKE.—"Pure white; form good; also producing noble trusses." 2*s.* 6*d.*

The set of eight for 20*s.*

For other varieties R. S. begs to refer to his "CATALOGUE OF FLORISTS' FLOWERS," which is now ready, and may be had on application.

1, Hope-street, Edinburgh, April 6.

JOHN VICKERY, NURSERYMAN, FLORIST, &c., begs to draw the attention of the Public in general to his splendid Seedling FUCHSIA "QUEEN OF THE FAIRIES," which he can highly recommend as a great acquisition to that beautiful tribe, as its colours are pure; tube and sepals pure white, corolla bright carmine, habit very compact, and an abundant bloomer. It obtained the First Class Certificate at the Royal South London Floricultural Society at the last September Show. To be sent out on the 15th of April. Strong plants 7*s.* 6*d.* each. The usual allowance to the Trade where two or more are taken. A remittance is requested from unknown correspondents.—Grove-road Nursery, Brixton, Surrey.

IMPROVED FORTY-DAY MAIZE, 6*s.* per dozen Ears. One dozen Ears will grow 4000 Plants. With every other kind of Seeds in Cultivation at such prices, to meet the times.

J. G. WAITE, Seed Merchant, 181, High Holborn, London.

FOR SALE, 80 bushels of Green-top Yellow Bullock, and 40 ditto of Purple-top Swedish TURNIP SEED, the growth of 1849, transplanted and carefully selected. For price, &c., apply to Mr. BRYAN CLARKE, Farmer, Tuxford, Nottinghamshire.

AGRICULTURAL SEEDS.—The following delivered free to London, or any Station on the Bury line to Norwich, at the present prices, as annexed.

GRASS SEEDS.

The best selected varieties, mixed in proper proportions of such kinds as possess the most desirable qualities suited for PERMANENT PASTURES, and adapted to different descriptions of soils, per acre 24*s.* 0*d.*

Fine mixed dwarf varieties for lawns, per lb.	1 3
Ditto, per peck	5 0
RYE GRASS, True Italian per bushel	6 6
" Perennial	5 0

Best English Red and White Clovers, Trefoil, and all other Agricultural Seeds of the best stocks at the lowest market prices. PRICED CATALOGUES of AGRICULTURAL SEEDS sent prepaid on application; also prices to the trade.

Post-office orders payable to BASS and BROWN, or to STEPHEN BROWN. Remittances required from unknown correspondents.

BASS AND BROWN, SEED AND HORTICULTURAL ESTABLISHMENT, Sudbury, Suffolk.

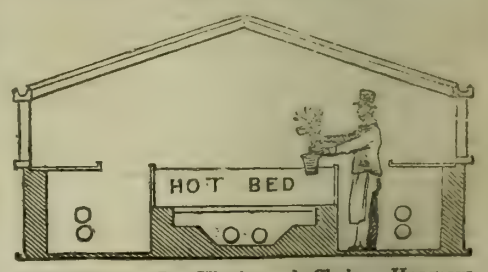
BEE HIVES.

GEORGE NEIGHBOUR AND SON respectfully announce that they have prepared for this season an extensive supply of their various IMPROVED BEE HIVES, which are offered to all who are desirous of cultivating that pleasing and profitable branch of rural economy—the Honey Bee. The collection consists of "Nutt's Collateral Hives," "The Single Box Hive," "The Amateur Bar Hive," "The Improved Cottage Hive," &c., from either of which the honey may be taken at any time without injury to the Bees, and may be worked with safety, humanity, and profit, by the most timid and unaccustomed to Bee manipulation. A descriptive paper, with drawings and prices, will be forwarded on the receipt of two postage stamps.—GEORGE NEIGHBOUR and SON, 127, High Holborn, London.

"Nutt on Bees" (6th edition), now published.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street.

CUCUMBER AND MELON BOXES AND LIGHTS.



One hundred 1, 2, and 3-light Boxes and Lights of all sizes ready for immediate use. Warranted best materials, packed and sent to all parts of the kingdom; 2-light Boxes and Lights from 1*l.* 4*s.* Garden Lights of every description, Conservatories, Green and Hot-houses, made and fixed in all parts of the kingdom. References given to the Nobility, Gentry, and the Trade, in most of the counties of England. JAS. WATTS, Hothouse Builder, Claremont-place, Old Kent-road, London.

HORTICULTURAL TOOLS.

GREEN AND CONSTABLE, 36, King William-street, five doors from London Bridge, have a large assortment of GARDEN TOOLS, containing all the recent inventions, and including Lyndon's Patent Cast Steel Spades, Shovels, and Garden Forks, Lord Vernon's Hoe, Jointed Hothouse Syringes, Transplanting Tools, Registered Garden Labels, Ladies' sets of Gardening implements, Pruning Sheare, Knives, &c. Agents for the Vitreous Porcelain Garden Bordering.—36, King William-st., five doors from London Bridge.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

BOILERS OF ALL SIZES TO BE SEEN IN OPERATION, WARRANTED THE BEST.

J. WEEKS AND Co., King's-road, Chelsea, HORTICULTURAL ARCHITECTS, HOTHOUSE BUILDERS, and HOT-WATER APPARATUS MANUFACTURERS, solicit an inspection of their various Works completed and in progress. Horticultural Buildings of every variety. BOILERS of all sizes to be seen in operation, and which they warrant to be the most effective and economical of any in use. The largest size Boiler is now effectually heating three extensive ranges of Forcing-houses, 230 feet by 22 feet, all Span Roofs and lofty, containing upwards of 50,000 cubical feet of air. Also various small and intermediate size Boilers, some of all sizes in operation. The consumption of fuel is very moderate, and the fires will continue from 10 to 15 hours without attendance. The extensive arrangements now in full operation on their premises, enables them to build to any extent, and at very moderate prices. Hothouses, Greenhouses, Conservatories, Forcing-pits, Frames, Glass Lights, &c. A very extensive collection of Stove and Greenhouse Plants, which are sold at very low prices. Plans, Estimates, and Catalogues forwarded on application.

J. WEEKS and Co., King's-road, Chelsea.

FLOWER SEEDS FREE BY POST. — One Hundred packets of the newest and best sorts for 18*s.*; Fifty for 10*s.*; Twenty-five for 6*s.* Selection can be made from RENDLE'S Descriptive Catalogue of Flower Seeds.

GERMAN SEEDS.—*We have a large stock of all the best varieties* (*See our Advertisement, page* 177, *March* 23, "Gardeners' Chronicle"), *including Stocks, Asters, Wallflowers, Balsams, Larkspurs, Hollyhocks, Zinnias, &c.*

For particulars apply to WILLIAM E. RENDLE and Co., Seed Merchants, Plymouth. Established 1786.

NEW GLOBE FUCHSIA, "KIMBERLEY'S INACCESSIBLE."—This splendid variety was raised from Williamsii, and is far superior, the blooms being twice the size of that variety; sepals very broad; tube rather short, of a bright glossy crimson; corolla rich deep velvety purple; habit very fine, and a free bloomer; foliage rich glossy green; will prove one of the greatest ornaments ever offered. Strong plants 10*s.* 6*d.* each, the 15th of April, may be obtained of C. KIMBERLEY, Florist, &c., Pinley, near Coventry, and of the following gentlemen, who have kindly ordered it: Messrs. WOOD and SON, Maresfield, Sussex; Mr. IVERY, Peckham, near London; Mr. GAINES, Surrey-lane, Battersea; and Messrs. WIDNALL and DAVIS, Grantchester, Cambridge.

SUPERB NEW VERBENA, ADAMS'S "MISS PAYNE."

The above beautiful variety was raised by Mr. W. Adams, Gardener to W. Hogg, Esq., Biggleswade, and will be found the best White Verbena of the season. To flowers of an extraordinary size it unites a delicious fragrance, which adds much to its attractions.

Extract from the *Gardeners' Chronicle*, Oct. 13, 1849. "W. A. A. Colour pale blush, fading to white; flowers very large, but narrow in the lobes; a good variety, on account of the size of its flowers, both individually and collectively."

Extract from a letter from Mr. J. Bundy, Gardener to — Trevor, Esq., Bromham Hall, Beds. "I beg to say I saw your seedling Verbena, and must say it was remarkably fine, much more so than any I had ever seen before, therefore you are at liberty to make what use of my name you may think proper."

Opinions, equally favourable, have also been expressed by Mr. Pullen, Gardener to the Hon. and Rev. H. C. Cust, Cockayne, Hatley, near Potton, Beds.; Mr. Pope, Gardener to Mrs. Harvey, Ickwell Green, Beds.; and many other gardeners, to whom reference is kindly permitted. Good Plants, post free, 5*s.* each; when two are ordered three will be sent.

London Agents: Messrs. HURST and M'MULLEN, 6, Leadenhall-street, and Messrs. HUGH LOW and Co., Clapton.

Address, SUSAN WOOD, Nurseries, Huntingdon.

P.S. Postage stamps received as payment.

KITLEY'S GOLIAH STRAWBERRY.

JAMES KITLEY, in again bringing his SEEDLING STRAWBERRY before the notice of the Public, takes this opportunity of thanking those Friends who so liberally purchased in the autumn, and it being now the best time for planting, begs to inform them that he has a fine stock of healthy plants, which have been transplanted. See extracts from the *Gardeners' Chronicle.*

From the *Gardeners' Chronicle.*—"STRAWBERRIES: *J. K.* Your Seedling Strawberry, 'Goliah,' judging from its size and appearance, is worthy of cultivation."

From the Gardeners and Farmers' Journal.—"STRAWBERRIES: *J. K., Lyncombe Vale.* We have great pleasure in bearing testimony to the exquisite flavour of your Seedling Strawberry, 'Goliah.' In our opinion it combines the piquant flavour of the Strawberry with the richness of the Pine, the delicious aroma of which it partakes in equal proportion with the taste. Apart from the queen of fruits, we certainly do not remember anything in this way that conveyed to our senses so delicious a treat as the noble fruit to be known to the world as 'Kitley's Goliah Strawberry.'"

Plants, 12*s.* per doz., or 4*l.* per 100. A liberal allowance to the Trade in plants, when 100 are taken.

Cash orders expected from unknown correspondents.

Lyncombe Vale Nursery, Bath, April 6.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND Co. beg to notice their mixtures for laying Land down to Permanent Grass are now ready. The general satisfaction they have given for many years past, and the present low prices of 32*s.* per acre, allowing 2 bushels and 12 lbs. to each acre, they trust will ensure a continuance of orders. Mixed Seeds for improving old Grass Land, 1*s.* 3*d.* per lb.; fine sorts for forming Lawns, 1*s.* 4*d.* per lb. Their Priced List for the season of Turnips, Mangold Wurzel, and other Farm Seeds, will be forwarded on application to 26, Down-street, Piccadilly, London.

SEEDS IN COLLECTIONS.

OF THE BEST WHICH CAN BE PROCURED.

BASS AND BROWN beg to offer the following CHOICE VEGETABLE SEEDS.

Complete Collections of the best and newest sorts, in proportionate quantities of each, suited for large or small gardens, at per collection, 1*l.*, 2*l.*, and 3*l.* A Collection for a small garden, of good sorts, at 10*s.* 6*d.* A List of the Collections furnished if required.

SELECT FLOWER SEEDS,

Free by post, with full directions for sowing, heights, colours, &c.

	s.	*d.*

Remittances with orders are requested from unknown correspondents. Goods carriage free to London, and with all orders of 2*l.* and upwards, articles presented extra. Post-office orders payable to BASS and BROWN or to STEPHEN BROWN.

Our Descriptive Priced Seed and Plant List will be forwarded, prepaid, on application, by forwarding four postage stamps, as copies having the Newspaper stamp are now all distributed.

SEED AND HORTICULTURAL ESTABLISHMENT, SUDBURY, SUFFOLK.

FERN SEEDS.

GEORGE BENNET begs to inform the lovers of Ferns that he has still a large quantity of NEW ZEALAND FERN SEEDS, and has much pleasure in announcing that they have vegetated. Price 2*s.* 6*d.* per packet. The names of the varieties are as follows: No. 1, Todia sp., variety australis; No. 2, Alsophylla medullaris, fine variety; No. 3, Cyathea dealbata; No. 4, mixed varieties of Hymenophyllum, Trichomanes, Adiantums, &c.; No. 5, mixed varieties of Alsophylla dealbata, or Silver Tree Fern; No. 6, Cyathea medullaris. A remittance must accompany the order either in postage stamps or Post-office order, made payable at Coventry, to GEORGE BENNET, Brandon, Warwickshire.

ROSEA STRIATA.—The Subscriber begs to inform the admirers of PELARGONIUMS that he has a few strong Plants of the above left at 10*s.* 6*d.* each, with an allowance to the Trade—with a few hundred of first-rate sorts to spare, at 5*l.* per 100 (strong plants) of Beck, Foster, Hoyle, and other raisers.—EDWARD PERKINS, Leamington, April 6.

EDWARD BECK, SLATE WORKS, ISLEWORTH. SLATE CISTERNS, &c.; COLE'S PATENT.

E. BECK informs Horticulturists and the Public generally that Mr. COLE has granted him the use of his Patent for the unexpired term, and he is now able to supply SLATE CISTERNS fastened without iron bolts or the usual oil cement, thereby doing away with the difficulty which has hitherto existed of forwarding such articles by rail or waggon, fixed and ready for use instead of in pieces, as heretofore.

E. B. will be happy to answer any inquiries as to the price of Cisterns, or any other Slate articles manufactured by him, such as Orange Tubs, Plant Boxes, Tanks, Shelves, Garden-path Edging, Hot-water Tank Covers, Flower Boxes for Balconies, Shelves fitted to hold water for Orchidaceous Houses, &c., all of which may be seen in use at Worton Cottage, Isleworth, on application to the Gardener, Sundays excepted.

Estimates given for Work as shown upon Drawings, and in specifications. A large stock of Slate Slabs of all sizes and thicknesses, kept on sale.

N.B.—Dairies fitted either with Shelves or Milk Pans, of very neat appearance.

The Gardeners' Chronicle.

THE last visit of Mr. FORTUNE to the port of Shanghae seems likely to be productive of no small benefit to gardens. We have already noticed the importance of the *Funereal Cypress*, there obtained by him, the perfect hardiness of which has now been conclusively proved by the late winter; and in another column will be found his own account of the *Japan Berberry*, one of the most beautiful of all evergreens, a figure of one of whose leaves has been given in "Paxton's Flower Garden." We can now announce the arrival of other plants scarcely inferior in interest, figures and descriptions of which will appear in the same work. Among those already living in Messrs. STANDISH's Nursery may be more especially noticed some new *evergreen Oaks*, a fine arborescent *Juniper*, several *Hollies* perfectly new in gardens, the true *yellow Camellia*, and the marvellously beautiful *Rhodoleia*, just figured by Sir W. HOOKER in the "Botanical Magazine." Of this last plant it is enough to say that, if drawings can be trusted, it is a rival to the finest of our Camellias and Roses. A more particular account of it will be given in "Paxton's Flower Garden."

MESSRS. BECK, HENDERSON and Co., the seedsmen in the Strand, have criticised, with no remarkable civility, the valuable attempts which our correspondent "R. T." has made, at our request, to reduce to something like order the polyonymous chaos of the seed-shops. They charge him with sundry inaccuracies, and tell us there are plenty more that could be pointed out; nevertheless, while indignant at his criticism, they in the main admit his accuracy, and vow that if they do sell trash it is to oblige their customers. They are astonished that the Augean stable, which they have for half a century been lending their aid to fill, should not be cleaned out with more dexterity, and they express by implication their contempt for the honest workman who, in sorting the rubbish that he finds there, has now and then mismatched, as they say, the worthless lumber.

It is quite possible that he has, although neither we nor the public will recognise the authority of interested parties. We have no doubt that errors have found and will again find their way into all attempts to identify things which have little or no fixity of character about them. Mistakes must necessarily be made in ascertaining what is meant by the name given in the trade to a particular sort of Pea; for the seedsmen themselves are not agreed about it. They either do not themselves know how to apply the name, or if they do know they consider it entirely unimportant, and substitute one thing for another. If any one doubts this let him try the experiment of purchasing a parcel of (say) "Nimble Taylor" Peas from 20 different seedsmen, and of sowing them side by side. He will then learn what sort of uniformity there is in the application of such a name. Or, as we have before said, let him collect from the trade all the Peas they sell under different names, and see what differences he will find among them. If he wishes to push his curiosity a little further, let him obtain from Messrs. VILMORIN, of Paris, a parcel of their finest Michaux précoce Peas, and sow them at the same time; the result will be more instructive than would be readily believed.

Everybody knows, although interested parties may deny it, that the quality of Early Peas is greatly influenced by the soil and climate in which the seed is saved. No seedsman of experience can be ignorant that if the same Pea is sown in the south of France, or in the warm sandy fields of the Suffolk coast, or in some parts of Kent, or on the cold heavy clays of Middlesex, the crop of seed will be entirely different as regards earliness; the French seed producing the earliest crop, and that from Middlesex the latest. But is the public, on this account, to be imposed upon by the invention of as many different names as there may have been fields in which the Peas were grown? An Early Frame Pea is an Early Frame Pea, whether it is raised in Narbonne or the Lothians, and no honest purpose is served by disguising it under a dozen aliases. There will be *temporary* differences in quality, which will last for a season, and have considerable practical value; but this does not by any means justify such distinctive names as are employed. All that can be sanctioned is some term of qualification, like Narbonne, Essex, Kent, Suffolk, to point out where the samples are from. In Mark Lane the Wheats from Essex, Kent, Lincoln, Norfolk, York, &c., are separately quoted; but what would be said of the corn-merchants if, instead of these terms, having a plain intelligible meaning which can mislead nobody, they employed the jargon of Nimble Taylor Wheat, double grained Wheat, single grained Wheat, thin-eared, thick-eared, and so on?

A race-horse in condition will beat the field; the same race-horse worse fed and unskilfully groomed will be distanced by the whole field. Plain people think that the horse is the same horse nevertheless; but there are dealers in seeds who would have us believe that the horses are quite different, and they call the horse Nimble when he is fast, and Charlton when he is slow.

To unstable qualities of this fleeting nature distinctive names ought never to be applied; names of qualification can alone be tolerated. Thus such shopkeepers' terms as "double blossomed," applied to Peas, are most objectionable; for they denote a permanent, and if permanent a valuable, quality; whereas nothing can be more uncertain or less permanent. Some samples produce a majority of double blossomed, and some samples a majority of single blossomed plants; while in others we find as many of one as of the other. If they are sold as different qualities of the same thing, and the samples are true, nobody suffers: but as soon as a peculiar fixed name is given to that which is in its nature fugitive and uncertain, confusion without end is introduced, and the public is imposed upon. Well may gardeners protest against such a state of things, and cry to us for aid. In the face of such a system no gardener knows what to do, or what to purchase, and, when his crop turns out the reverse of what he expected, he has no redress. It is in vain for him to say that the seeds he bought are untrue; the seller calls upon him to prove his case, and his proof necessarily fails, because no two seedsmen will agree as to what is what.

Mr. MASTERS' letter is just what might be expected from his high character; he admits the importance of our inquiry, and readily lends his assistance in promoting it. We recommend his observations to the attentive consideration of our readers; they will well repay perusal. He frankly admits that *the self-same kind is constantly put upon the public under a new name;* and he furnishes his experience and authority to the correction of the abuse—not in a carping tone, and with all the reluctance which it is prudent to show in the face of an unmistakeable determination of the public no longer to be trifled with—not throwing blame upon his customers because they will continue to order nonentities; but plainly telling the truth, as a man like him will always do. It is to the MASTERSES of the United Kingdom that the public must look, if the trammels of the "Trade" are to be shaken off; and not to those who evidently prefer to let things remain comfortably as they are, supplying 20 different kinds of seed out of the same bag, charging 20 different prices for their trouble, taking good care not to make their customers too knowing, and, above all things, detesting the impertinent curiosity of the public press.

We can assure those gentlemen that they much mistake their "own interest;" and that it is not impossible that their house may be set in order by their customers, unless they undertake the work themselves. With them lies the duty of establishing the identity and the quality of all the articles they sell; of making such facts honestly and fearlessly known to the public; and of refusing to deal in that which only ignorant men think of buying. The example has been set them well by several of those whom they presume to designate as "little people," and they

are not unlikely to find, unless they follow our advice, however unpalatable it may be, that the "little people" will eventually swallow up the "great ones."

It may be interesting to the growers of tropical fruits to learn the present condition of Sir GEORGE STAUNTON'S celebrated MANGO TREE. And we are happy to gratify their curiosity, by publishing the following memorandum, which we owe to Mr. SCOTT, gardener to the Right Hon. Gentleman. "The number of flowers on the large Mango Tree may be stated at near a quarter of a million. There are 108 heads or panicles of flowers. The number of flowers on each panicle exceeds, on an average, 2100: but only a small proportion of these are *perfect*, and capable, even under the most favourable circumstances, of producing fruit."

THE season at which SEEDS of all kinds are to be sown in heat having now arrived, and almost every gardener having bad or doubtful samples entrusted to his care, we venture to draw attention to an old subject, concerning which no recent information has been gained, and which is nevertheless a very important one.

It is now many years since Mr. OTTO, of Berlin, stated that he had employed oxalic acid in order to make old seeds germinate. The seeds are put into a bottle filled with oxalic acid, and remain there till the germination is observable, which generally takes place in from 24 to 48 hours, when the seeds are taken out, and sown in the usual manner. Another way is to wet a woollen cloth with oxalic acid, on which the seeds are put, and it is then folded up and kept in a stove; by this method small and hard seeds will germinate equally as well as in the bottle. Also very small seeds are sown in pots and placed in a hotbed; and oxalic acid, much diluted, is applied twice or thrice a day till they begin to grow. Particular care must be taken to remove the seeds out of the acid as soon as the least vegetation is observable. Mr. OTTO found that by this means seeds which were from 20 to 40 years old grew, while the same sort, sown in the usual manner, did not grow at all.

It is said that others have derived great advantage from this plan, to which our attention has been more particularly drawn in consequence of Mr. VAN HOUTTE, a most intelligent and skilful cultivator, having only a few months since spoken of it in terms of commendation.

Other agents have been also used, with apparent advantage, for the same purpose. A seed cannot germinate until the carbon with which it is loaded is to a considerable extent removed; the removal of this element is effected by converting it into carbonic acid, for which purpose a large supply of oxygen is required. Under ordinary circumstances, the oxygen is furnished by the decomposition of water by the vital forces of the seed; but, when those forces are languid, it has been proposed to supply oxygen by some other means. HUMBOLDT employed a dilute solution of chlorine, which has a powerful tendency to decompose water and set oxygen at liberty, and his report was extremely favourable.

In like manner, Mr. LYMBURN, of Kilmarnock, mixed newly slaked lime with old Spruce Fir seeds, and he asserts that, although under ordinary circumstances they would hardly grow at all in the second year, yet when even three years old, having been first damped and then mixed with newly slaked lime, they produced an average crop of healthy plants. This result is attributed to the fondness of lime for carbonic acid; and it has been supposed that the beneficial result, said to have been obtained, arose from the carbonic acid formed by the seeds, when germinating, having been abstracted by the lime as fast as it was extricated.

Now these are little experiments which amateurs can try better than gardeners; and to them we more especially commend them. Only we hope that those who shall engage in the proposed trials, will take care that the experiments are not left open to future cavil. To avoid which, it is indispensably necessary that each trial should be made against the same number of seeds, from the same parcel, sown in the same earth and treated alike in all respects, except in the administration of the proper dose of lime, or chlorine, or oxalic acid, to one of the two parts. Then indeed we shall know what the processes are worth, and not till then. If they have the value assigned to them it will be an important gain to our stock of practical knowledge; if they prove valueless others will be spared the necessity of repeating the experiments.

NOTES OF A TRAVELLER.—No. X.

AN ACCOUNT OF THE DISCOVERY OF A FINE NEW EVERGREEN SHRUB NAMED BERBERIS JAPONICA — My Chinese coolie and myself were busy collecting Tea seeds on a small hill, not far from the town of Tun-che, in the green Tea country of Hwuy-chow. While so engaged I accidentally caught a glimpse of a very fine specimen of the Funereal Cypress, described in my next letter. I was so charmed with this new tree that I determined on going to the spot where it was growing, to enjoy a nearer view. I desired my attendant to accompany me in case any ripe seeds might be found upon it. As we approached the village we discovered that the tree was inside a garden, which was surrounded by a high wall. Naturally supposing that there must be a gate somewhere, we walked round the walls until we came to a little cottage, which seemed to serve the purposes of a lodge. We passed in here with all the coolness of Chinamen, no one asking any questions, and soon found ourselves in the middle of a dilapidated old garden. A large house which had been the mansion in former days was, like the garden, in a ruinous condition. The Funereal Cypress grew in the middle of the place and was covered with ripe seeds, which increased the collection I had formerly made. Its height was about 50 feet, the branches grew horizontally from the trunk, then curved upwards, and were again pendulous at their points. The long branchlets hung straight down, and many of them nearly reached the ground.

Having taken a survey of the place, we were on our way out when an extraordinary plant, growing in a secluded corner, met my eye. When I got near to it I found that it was a very fine evergreen Berberis, belonging to the section of Mahonias, and having, of course, pinnated leaves. Each leaflet was nearly as large as the leaf of an English Holly, spiny, and of a fine, dark, shining green colour. The shrub was about 8 feet high, much branched, and far surpassed in beauty all the known species of Mahonia. It had but one fault—it was too large to move and bring away. I secured a leaf, however, and marked the spot where the plant grew, in order to get some cuttings of it when I was ready to leave that part of the country.

Travelling onward until I reached the far-famed Sung-lo mountain, where the green Tea plant is said to have been first found and cultivated,* I took up my quarters in a farm-house which belonged to a man named Wang, the father of one of my servants. Amidst other avocations I did not lose sight of my beautiful shrub, which I was most anxious to possess, and, if possible, introduce to Europe. I had frequently desired my servants to procure some young plants from the neighbouring gardens, as I could not believe the species so rare as only to be found in the old garden where I had first met with it. However, they either could not find it, or, what was more probable, they gave themselves no trouble about the matter. Knowing the potent influence of dollars, I called three or four of the family around me one morning, and showing them the leaf which I had preserved, promised a dollar to any one of them who would bring me a small plant of the same thing. One of them immediately went out, and to my surprise and pleasure returned in less than five minutes with a fresh leaf of the plant in question. "That will do," said I, "that is just the thing I want; bring me a young plant with good roots, and I shall give you the promised reward." They now held a consultation amongst themselves in a low tone, and at last said, the plant had some peculiar medical virtues, and that the possessor would not part with it. "Sell me this one," I replied, "and you will be able to buy a dozen with the money." "No," one of them replied; "my uncle, in whose garden it grows, does not want money, he is rich enough, but he requires a little of the plant now and then when he is unwell, and therefore he will not part with it." This was very provoking, but as the Chinese were firm in their refusal, there was nothing for it but "going upon another tack," as sailors say, and trying my luck in that way. This I determined to do. "Well, at all events," said I, "let me see the plant, don't be afraid, I shall not touch it." They refused even to do this for some time, but were induced to consent at last, and led the way down to a small cottage garden, nearly overgrown with weeds. Here the beautiful shrub was growing, apparently neglected, and left to "bloom unseen." I tried hard to induce the uncle to part with it, but could not succeed. It might be that he really valued its medical properties, or, what was just as likely, he perhaps supposed I might be induced to offer some extravagant sum. He told me that it had produced most marvellous effects upon patients who had received blows or concussions of a serious nature, and that it was also useful in cases of rheumatism. The roots are cut into small pieces and boiled, and the decoction is taken inwardly. If the eyes are weak, or have been injured by a blow, they are rubbed with a decoction made from the leaves.

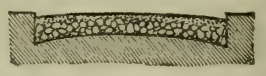
On the following day another relation of Wang's came to me in a secret manner, and informed that he knew where the same species was to be procured, and that he was willing to go and fetch some of it for me. I engaged his services at once, merely stipulating for young plants with good roots, as others would have been quite useless to me. These he promised to bring, and he kept his word. In the course of the day he returned with several good plants, which he sold to me, and which I afterwards succeeded in getting down in good order to Shanghae, to Mr. Beale's garden.

Sir Wm. Hooker informs me that this may be the plant which Thunberg calls Ilex japonica, and which is only known by a figure and description. I have not seen the figure, but the description is now before me, and does not agree with my plant in several important matters. I have therefore named this species Berberis Bealei,* and thus describe it: An evergreen shrub, 8—10 feet high. Leaves 12—18 inches long, pinnate (four pairs and an odd one), leaflets large, oblique a cordate at the base, odd one ovate and cordate, pointed and spiny, smooth, of a shining green, and very like the English Holly. Flowers in terminal spikes, spikes about 12 in number, each 6—9 inches long, yellow. Fruit of a glaucous blue. Flowers in winter, Dec.—March. From the district of Hwuy-chow, China. Chinese name *Shae-ta-kong-la*. *R. F.* [There is no doubt about this being Berberis japonica. The *learned* Professor Thunberg did not know the difference between a Holly and a Berberry.]

* See "Ball on the Cultivation and Manufacture of Tea."

GRAVEL WALKS.

IN the various communications which have yet appeared on this subject, one or two points—not without interest or importance—do not seem to have been discussed. The principal of these are, the appearance of the walks, as parts of a landscape composition, and the kind of gravel of which they are formed.



Although a walk is essentially intended for use and comfort, it will be admitted that it may exercise a considerable influence on a garden scene; and that, therefore, its usefulness is not alone to be considered. According as a walk is or is not artistically treated, the beauty and character of a garden may be either preserved or marred.

In the two different styles of landscape gardening—the old geometrical and the modern English—walks have, I conceive, to play a very different part. Of the formal style, good bold walks are necessary and prominent features, by which alone can be sufficiently indicated the lines of which that style is composed. To the English manner, on the other hand, the obtrusion of walks, with their serpentine lines, into a general view, would be a blemish rather than a merit; irregularity and indefiniteness, breadth and intricacy of lawn being the leading characteristics of this system.

Now it must be obvious, if these premises be conceded, that raised walks, much rounded in the centre, will be alike unfitted to harmonise with the general flatness and smoothness and dignity which form the very essence of the geometrical style, and with the demands of the English manner for the quietness and concealment of walks. In the latter case, it is true, the walk might be wholly planted out from the lawn by shrubs of various heights and characters; but this would involve carrying the walk close to the boundary of a place, or would otherwise greatly curtail the size of the lawn, and be destructive of anything like effective variety along its margin. Walks that are raised above the surface of the ground, and much rounded up in the middle, are, consequently, by no means artistic in a gardener, or capable of being nicely adapted to either of the prevailing styles of treatment. A broad and straight walk, in a formal garden, appears to call for a great degree of flatness (though it need not be absolutely level, or it will never be dry), to make it correspond with the extreme regularity and evenness of everything else in the garden; and a serpentine walk, amidst the flowing outlines of the more natural style, would seem to want keeping down more or less below the general level, that it may be as inconspicuous as possible.

If it be urged that these requirements of art are incompatible with convenience and dryness, I venture to allege that they need not be so, when the foundation of the walk is properly formed and drained, and the gravel used is of a sufficiently porous description. We have had several miles of walks in use here for five or six years, and I have formed quite as many more in different parts of the neighbourhood; and though the soil is mostly a stiff clay, and the surface of the middle of the walks is from 1 to 4 inches below the general level, being only raised about 2½ or 3 inches in the centre in a width of 10 feet, we never know what it is to have wet walks, unless for half an hour after a heavy storm, or when a series of sharp frosts and sudden thaws slightly disturbs the surface. And yet we have scarcely any gratings to take off the surface water.

The annexed section will show the manner in which I usually have walks made. It is to a scale of 10 feet to an inch, and represents a walk 10 feet wide, raised

3 inches in the centre, with 9 inches of broken stone as a foundation, and a coating of gravel 3 inches thick. The deeper cutting (8 or 9 inches below the rest), on either side is filled with rather larger stones, for drainage, and should communicate, in the lowest parts, with the general land drains. The plan is quite as well adapted for a private road as for a walk, and with a little larger material a foot in depth, as a foundation, would answer for a public road also. The side edgings of Grass or soil should be about half an inch above the gravel only, and quite flat for the width of from 9 to 18 inches; after which they may take any required level or direction. When there are high banks near the side of the walk, a small rubble drain in the flat edging between the bank and the walk, will intercept the soakage from the corner.

Walks thus made have been put from 4 to 6 inches below the general level without becoming at all damp. But then, the gravel here being chiefly obtained from

* Named in compliment to my friend Mr. Beale, of Shanghae, in whose garden many of my finest plants have been preserved.

the sea-shore, or the beds of rivers, is generally of a very loose and porous texture, and requires the addition of a fifth or sixth part of finely powdered stiff loam, in order to make it bind. Gravel of a more binding nature, however, obtained from Staffordshire and elsewhere, keeps equally dry on such a foundation. It is gravels that contain a large proportion of aluminous matter, or chalk, or lime-stone, that in general become so wet and dirty in rainy weather. And walks in districts where such kinds of gravel only can be procured will require to be made of the more solid parts of the gravel, leaving out the finer and more decidedly earthy portions. For it is in attention to the texture of gravels, and the rejection of the clayey and chalky parts, that a dry material for walks can alone be obtained.

We are fortunate here in readily procuring good sandstone as a bed for walks and roads. This, when broken to pieces of from 3 to 6 inches in diameter, has all the angularity and dryness which can be desired. In other places, however, I have used coarse coal-ashes and scoriæ, or an inferior kind of chalk which abounds in some districts, or limestone, with similar advantage. Around London, or where pebbly stones are got from the sea-shore, or the channels of rivers, these, or coarse gravel, can easily be broken to any required roughness and angularity; and nothing could be better than flint or strong gravel thus broken.

The proportion which the height of a walk in the centre should bear to that of the sides, is, as far as I have tested it, about one inch to every yard in width. *Edward Kemp, Birkenhead-park, March 27.*

DISEASES OF PLANTS.

(*Continued from page 197.*)

Genus XVI. Fractures.—I understand by this term a solution of continuity effected, not by a sharp instrument, but by some violent force, which either entirely or partly breaks the plant. Thus, the wind, lightning, the weight of snow, hailstones, the hand of man, a sharp blow, will break a tree or an herb, lacerating its fibres. I distinguish two species.

First species. Total Fracture.—When from any of the above causes a portion of a plant is completely separated from it, it becomes necessary to heal the branch that remains, in order to prevent the evil consequences of the fracture. This must be done by cutting down the wounded part, so as to reduce it to an amputation with a smooth surface, and applying the cement as above directed. The neglect of this operation is the cause of the loss of many trees, especially fruit trees. The lacerated portions become a harbour for insects, and a means of admitting wet into the heart of the tree; the majority of the trees which we see infested by ants, and eaten through by larvæ of other insects, owe the presence of these unwelcome guests to neglect after similar accidents. I have seen numerous examples in Chestnut groves of trees thus destroyed.

Second species. Partial Fracture.—Sometimes the fracture does not wholly separate the branch, but it is only separated to the centre, or a small portion of the bark only remains entire. In such cases the general practice is to depair of the whole and condemn the branch entirely; yet, in nine cases out of ten, the mischief may be successfully repaired. A tall Bignonia radicans, and a Justicia adhatoda of 2 inches in diameter, which the wind had broken half through in their main stems, and many others similarly injured and successfully healed, have encouraged me always to make the same attempt after such accidents. If the fracture is not very complicated, it will be the less difficult to join the parts together again, removing any fibres which most impede the union. If, however, the sound parts are very few, the operation is more difficult; but with patience, especially if it happens to be at the time when the sap is rising, the broken parts may generally be sufficiently united, provided a small portion of the bark at least has remained intact; nature will do the rest. The first point to be attended to is to see whether the branch can be so fixed, that when the wound is bound up, it may remain perfectly steady, and neither torn down by its own weight, nor agitated by winds. Then, after the parts have been carefully united, they should be bound round with Willow twigs split in half; or better, in the case of small branches, with worsted, or lastly with strips of bark; this last substance, however, is not so good, as by drying up it may bind the branch too tight. Sometimes it may be necessary to cover the part with moss and bind it strongly to a piece of wood, when it is not certain that a simple ligature will keep the parts well united. I have never found it necessary to add any clay or wax or glutinous substances, as some persons recommend.

SPINACH.

The varieties of Spinach are but few. Their seeds are either Smooth or Prickly. One of the varieties with smooth seeds is adapted for summer use; all the others, and the Prickly, afford a supply for winter.

A. Seeds smooth; *Graines lisses, ou sans piquants.*

1. *Summer Spinach*, aliàs Round Spinach, Spring Spinach, Thick-leaved Round Spinach, Épinard d'Hollande, ou Épinard rond. The name we have adopted amongst these denotes the period of use; and frequent sowings, which may be made between the rows of Peas or other crops, are necessary. The leaves are large, roundish, and thick.

2. *Flanders Spinach*, Épinard de Flandres, Épinard de Flandres à très larges feuilles. This is a winter Spinach; leaves large, hastate, from 6 to 8 inches in breadth.

3. *Lettuce-leaved Spinach*, aliàs Épinard d'Esquermes, ou à feuilles de Laitue. This is an excellent new variety, which has lately been distributed by the Horticultural Society. The leaves are somewhat rounder than those of the Flanders Spinach, of thick substance and dark green colour. It is perhaps not quite so hardy as the Flanders, but it usually stands the winter sufficiently well, and from its superior quality it deserves to occupy at least half the ground allotted for the winter crop of Spinach. A variety called *Épinard Gaudry*, if not identical, is very similar to the preceding.

B. Seeds Prickly; *Graines épineuses.—Prickly-seeded*, aliàs Winter Spinach, Bordeaux, Épinard commun. This is readily distinguished by the seeds being prickly. The leaves are smaller and thinner than those of the Flanders, and very much thinner than those of the Lettuce-leaved, consequently these varieties must be accounted preferable.

4. *New Zealand Spinach.* This, though a species of a different genus from that of the preceding varieties, is now generally included in the lists of Spinach. The great advantage it possesses is that of supplying fresh leaves, fit for use, through the whole summer, even in the driest weather, when the crops of Summer Spinach are useless. But it is only in such a case that it can be estimated as useful; for, under other circumstances, the varieties of the common Spinach are superior to it in quality. It must be raised in heat, in March, kept in small pots till the end of May, and then planted out 3 or 4 feet apart, for it spreads much. Of course, the richer the soil the more succulent the foliage. The seeds should be steeped for 24 hours before sowing. *R. T.*

VILLA AND SUBURBAN GARDENING.

In out-door gardening, watering and mulching are operations intimately connected. Where a mulching of half-decomposed litter is used, evaporation will be greatly retarded; but it is not in every case that mulching can be applied, more especially in ornamental gardening. In the kitchen garden mulching is often neglected, when it would be found of great service in protecting the roots of vegetables from drying winds and scorching sunshine. One good watering with mulching is at least equal to three waterings when no covering is used; besides, if the litter is of an enriching nature the water poured upon it will convey its good properties to the roots, and it will have the same effect as a dressing of liquid manure. In new plantations of fruit trees, whether of the larger or smaller fruits, covering the roots for some distance, say 3 feet from the stem, will prove more beneficial to the trees in promoting their growth than a daily supply of water would be.

In the flower garden and other ornamental ground, where mulching cannot be used, if high keeping is desired, it will be of importance to stir the ground where it can be done before water is administered. Some advise water to be given little at a time and often; others, on the contrary, insist upon giving a good soaking at once, and then discontinuing it for some time. The former method is said to represent the natural dews, and not to cool the earth so much; but I recommend the latter system, if it be rightly practised. In the first place, the water should not be pumped from a well, and used in a cold state; that would be contrary to Nature and opposed to all the best principles of cultivation. It should be exposed for some time to the action of the sun, or its temperature should be raised to 80° by artificial means; it will then have no injurious tendency. Water in this condition may be used until it reaches every fibre, and with the best results, especially if vegetation is progressing rapidly. It is clear that growth cannot proceed kindly unless the roots are all supplied with moisture at the same time, and for this reason let all your waterings be effectual. Continued soaking, however, must not be practised; time ought to be given for the plants to absorb the moisture thus applied, or the air to expel it, for unless air as well as water reaches the roots vegetation will not thrive, and our labour will be thrown away. The amateur must therefore exercise his own judgment and discretion in determining when plants are suffering from drought, and when the soil is in a condition to receive an artificial supply of moisture. Much will depend upon the natural temperature of the atmosphere; if the weather is hot, rapid growing vegetables may be watered plentifully with impunity. It should be done in the afternoon or evening. *Pharo.*

Home Correspondence.

Vegetable Seeds.—No one can deny that great confusion has long existed amongst these in consequence of a multiplicity of names having been given, in many instances, to the same sort; and the evil has been complicated by the application of the same name to different things. When I commenced with the series of lists which have appeared in the columns of this Paper, I did not think it possible that anyone could effectually clear up these matters by a first attempt; or that in this attempt the utmost perfection should be indisputably attained. I cannot therefore be astonished if some errors should be pointed out with the view of correcting them; but I trust they will prove few, and individually not very important as regards the usefulness of the lists in question. At p. 199, I am accused by Messrs. Beck, Henderson, and Co., of having confounded single blossomed with double blossomed Peas. The fact is, there is no really permanent distinction between them. Let any one get "single blossomed Peas," and he will probably have an Early Frame, or perhaps a Charlton, with several of the first blossoms single, the others double. With regard to Warner's Early Emperor being widely different from the Early Kent, I have found it to grow stronger, its habit of growth being intermediate between that of the Early Kent and Early Frame; the latter has doubtless been the origin of all these, and likewise Prince Albert. I question much whether they might not be all correctly enough designated as varieties of that old variety the Early Frame. The Scimetar, Late Dwarf, Tewsley Dwarf, the Spanish Dwarf, and Royal Dwarfs, are placed on the authority of a paper on the variety of Peas in the "Transactions of the Horticultural Society," second series, vol. i. If this paper contained errors, Messrs. Beck and Co. should have corrected them long since. The Early Hero is certainly not a very early Pea. I have stated its season, I believe, correctly, and it is no fault of mine if its season and name do not exactly correspond. At p. 53, I enumerated—8. *Early Dwarf*, aliàs Nain Hâtif, or L'évêque (Lévégue was a misprint), and mentioned that the Spanish Dwarf and Bishop's Dwarf, "which sorts resemble each other, are inferior to the Early Dwarf, and must now be considered as entirely superseded by—9. *Bishop's New Long-pod.*" I admit that it is possible, nay probable, that Mr. Bishop's name would be translated *L'Évêque* by the French; yet I know from experience that Bishop's Dwarf, as we now have it, is inferior to the Nain Hâtif received from Paris. In "*Le Bon Jardinier Almanach pour l'Année* 1850," the *Pois L'évêque* is stated to be the same as the *P. nain hâtif.* Treating of the latter, it is added, "*Il a été reproduit depuis quelques années comme un nouveauté (bien qu'il soit fort ancien), sous le nom de P. L'évêque.*" The Nain Hâtif is doubtless a very old variety. It is described in the "Bon Jardinier" for 1818; whereas Bishop's Dwarf, or Bishop's Early Dwarf, was only first made publicly known in 1825, by Mr. D. Bishop, near Perth, in Loudon's "Gardener's Magazine," vol. i. p. 126. Its history, description, and mode of treatment are there given. It was obtained by Mr. Bishop, a few years previous to 1825, from a large sowing of the Spanish Dwarf (I have placed both in the same category). The variety was saved from a single plant of that sowing. Now, I cannot see that I should be justified in making a sport of the Spanish Dwarf synonymous with a much older variety, the Nain Hâtif. As to the Toker Bean, it was received from an old established firm as the "*Green Windsor or Toker;*" and from other sources it proved the same as the Green Longpod. *R. T.*

Glass Pipes for the Conveyance of Water.—Seeing an enquiry in your Paper for glass pipes (which we believe were advertised in the *Chronicle* for months), we shall be obliged by your referring the party enquiring in your Number of the 16th ult., to us as manufacturers. We have laid them down in various places with perfect success; and with regard to the pressure they sustain, with our best joints they will bear from 200 to 300 lbs. to the inch, according to their diameters. *Coathupes and Co., Glass Works, Bristol.*—Messrs. Hetley and Co., 35, Soho-square, sent some last summer to Walcot-park, near Stamford, where they were laid down by the gardener and joined together by a plumber with cement, sent by Messrs. Hetley. They have answered perfectly in bringing water from a spring in the garden to the scullery window, a distance of more than 400 feet. There is a little fall the whole way; the pipes will not bear much pressure. *A Subscriber.*

Birds: Food of the Titmouse.—If Mr. Doubleday has succeeded by the aid of his telescope in observing what insect the titmouse (Parus cæruleus) feeds on when he pecks off the blossom buds of the Cherry tree, I shall feel much obliged if he will favour me with the name of it, as I feel much interest in the subject, and have entirely failed in discovering the presence of any larva or insect whatever about them, although I have repeatedly examined them with a pocket lens on the trees, and dissected them under a compound microscope. In two or three other instances I have found no difficulty in discovering the objects of his search, without the aid of any glass at all. Mr. Doubleday states that he only removes a bud or two in search of his food, but I have seen for the last 20 years the ground under Cherry trees covered with the blossom buds, and often watched him doing it, and it appears to me that no necessity exists for his pulling off these buds for this purpose, as there is plenty of space for a much more clumsy performer than he is, to pick out insects, if they were there. I am willing to admit that insects form the chief part of his food; still the loss of many a fine Pear and Apple (for he generally selects the best) are a sufficient proof that he has also a taste for dessert. Notwithstanding this, and his decimating the Cherry buds, of which there are always plenty to spare, I would by no means persecute, but rather encourage this sprightly and most useful race of birds, being well convinced, by close observation of their habits, that they do at least ten times more good than harm. *F. J. Graham, Cranford.*

Brown's Fumigator.—Within the last few days I have been enabled to give this invention a fair trial. The principles upon which it acts are admirable, causing a most complete, and hence economical combustion of the most essential portions of the tobacco, and emitting a dense column of smoke in a perfectly cool state, so that all fear of scorching is avoided. To those who think of obtaining a machine, I would recommend the larger sizes, being more efficient for the fumigating of

greenhouses and hothouses, or similar erections, the smaller being only adapted for frames. *Frank Masters, Exotic Nursery, Canterbury.* [We believe the praise thus given to Mr. Brown's invention to be perfectly well merited.]

Protecting Fruit Trees.—The following kinds of protection have been recommended: 1st, canvas; 2d, netting; 3d, Fir branches. The last (the Fir branches) is by far the best; if carefully put on, the air will circulate freely through them. Last year we had some Apricot trees in full bloom early in March, I covered them with Spruce branches, and by that means alone obtained a good crop, besides having many for tarts; this year the trees were covered with nets, and the top of the wall was loaded with Spruce branches, which projected more than 2 feet over the trees, yet all is useless, for we have had 12° of frost, but we had 8° last year when the fruit was setting, and yet we saved a good crop. One morning early last week, when the quicksilver was standing at 20° Fahr., I examined the trees, everything appeared right, with the exception of the petals, which looked a little brown. When the sun made its appearace, however, the mischief became apparent, 9 out of every 10 blossoms were spoiled. Had there been 15° of frost, and the trees been carefully covered with branches, so as to keep the stamens and pistils dry, and to prevent the sun from taking effect on them, the fruit would have been safe. I will venture to say that if all had been entrusted to the Fir branches, I should have had plenty of fruit. *Bedale.* [We quite agree with you that there is nothing like Spruce Fir branches. But where are small folks to get them? If they trespass on their neighbours' plantations, they carry their horticultural zeal somewhat beyond what the law permits. In country places there may be no difficulty, but near towns there is a good deal.]

Garden Walks.—I stated at p. 198, col. *b*, that the foundation or bottoming should be made with any description of stone or brick rubbish, to which mortar was attached; the latter being a preventive of worms. I will now offer a few remarks on gravelling. It is almost useless to recommend any particular description of gravel, for necessity generally compels people to make use of what their locality affords; but it is worth while to observe that the kind of gravel which binds firmest in dry summer weather clings most to the feet in wet weather, while that which has a tendency to become loose in dry weather is driest and cleanest in wet. This invariably holds good, and the reason is obvious. We all know that the material we call gravel is a mixture of stones and finer matter. Now, when this fine matter has a sharp gritty character, it requires very little judgment to foretel that it will allow water to percolate freely through it, while every shower of rain will settle or solidify it; on the contrary, if the fine matter be of a loamy adhesive nature, it is equally certain that it will bind firm and hard when dry, while its property of retaining water, or rather preventing its percolation, makes it sure to be dirty when wet; but certain modifications may neutralise both these evils. A judicious mixture of the two kinds of gravel will make a tolerably good walk at all seasons; or even the loamy gravel may be made pretty clean in wet weather, by having plenty of stone in it—I mean by adding some more small stones before laying it on, otherwise sift some of the fine matter out, so that no more is left in than is sufficient to bind the stones together. A very useful and good walk may be made in that way; and as the first heavy rain after making is sure to wash a great portion of the finer material downwards, the surface of the walk will then present the appearance of a pavement in miniature, and in walking over it the foot will rest on the stones only; such a walk is generally clean except after frost. It is needless to add, that the smaller the stoney portion of such walks is, the more agreeable they are to walk upon. The principal thing, however, is to lay the gravel on pretty thickly, to roll it well, and whether large or small stones are at the top, it does not signify, provided the walk be smooth. When the gravel is of a sharp or gritty nature, something like very coarse sand, you may rest assured that in spite of daily rollings it will become loose in dry weather, while after rain it will be smooth and pleasant. If you have no means of neutralising it by mixing it with some more adhesive kind, you must sift it much finer than I recommended for the other sort, and let no stones larger than a boy's marble be near the top, because the wear and tear of the walk will be sure to raise them to the surface, and anything larger than that size would look bad, independent of being unpleasant to walk upon. I have been the more explicit on this matter, because I think there is often a wrong impression entertained respecting the properties of gravel. Many people seem to think that the firmest binding material must necessarily be the best in all weathers, but such is not the case. Although the above remarks apply to pit or drift gravel, yet they hold equally good when other substances are employed. I have seen a very nice walk made of a peculiar kind of factory ashes; and the chippings, or what are called the cuttings, of the lead mines, make beautiful walks. I am told there is a kind of spar gravel suitable for walks in some of the midland counties, but I have never seen it. The chippings of blue stone, used for building purposes, make a good firm walk, but they are liable to get mixed with dirt, and near the sea coast fine walks are formed of decayed cockle shells, whose clean white appearance makes them general favourites for that purpose. *S. N. V.* [Certainly you are *not* the person answered last week.]

Bees.—In his observations upon "Y.'s" account of feeding bees at night, "A Peebles Bee-Keeper," leaves it to be inferred that he advises the shutting bees in when feeding. Knowing that this, whether by day or night, is a very dangerous practice, I beg to caution your apiarian readers against its use. Whenever bees are fed, the stir and bustle always raises the temperature of the hive very considerably. A large proportion of the bees, as if only made aware that food is to be had for the fetching, rush out of the hive, and much danger would be incurred if they were prevented doing so. Feed just before dusk, when the bees, if abroad, are about to retire for the night. Those fed will then have time to make their tumultuous rush out of doors, and return ere it is dark; while other bees will not be made aware of their neighbours having been fed, and all will be cleared up before morning. *R. Golding, Author of the "Shilling Bee-Book."*

Winter Salads.—The "Corn-salad" commonly used in the north of France under the name of Salade de Blè, is, according to Loudon, the Valerianella olitoria. Sow it in August, in shallow drills, 6 inches apart. A bed 20 feet by 4 feet will supply a moderate family well all through the winter. The Corn-salad with roasted Onions and baked not boiled Beet, mixed with three parts of oil to one of vinegar, is as nice a salad as one can wish for. The amateur should cut it off, not pull it up when wanted, as it sends up fresh heads, and will last from November till the end of April. *W. H., Horsham.*

Mowing Machine v. *Scythe.*—Both should be used for lawns. In wet weather, on moist soils, it is almost impossible to get the machine to work well, whilst in droughts it is nearly as difficult to make the scythe cut the Grass. In dry weather the machine acts most beautifully, cutting so close and even, and with such trifling labour, that every one who has a chain of lawn to be kept in order will find it profitable to purchase one. I use Budding's. *Sigma.*

The Weather.—As it may be interesting to compare the temperature during the last few days in different places, I annex an extract from a register carefully kept at this town, north aspect.

E. Copland, Chelmsford, Essex, April 3.

Societies.

HORTICULTURAL, *April* 2.—E. BRANDE, Esq., in the chair. Messrs. Veitch, of Exeter, exhibited an extraordinary Melastomaceous plant, belonging to the beautiful genus Medinilla. It measured 4 feet high and as much through, and from the ends of the branches, which were clothed with large rich green leaves, hung down noble panicles of rosy pink flowers. The main peduncle and secondary branches of these panicles were also rosy pink, and they were furnished near their base with large pink bracts, which gave them an amount of gaiety they would not otherwise have possessed. It was stated to be a plant of easy management, and is altogether one of the handsomest additions our stoves have received for some time. A large Silver Medal was awarded it.—Mr. Plumbly, gr. to E. J. Dimsdale, Esq., received a Banksian Medal for four large specimen Heaths, consisting of Willmoreana, transparens, triumphans, and penicillata.—Messrs. Jackson, of Kingston, showed a nice light-coloured seedling Camellia, named Countess of Ellesmere; and Mr. Ambrose, of Battersea, a variety of Gledstane's Azalea, called Magnifica.—Mr. Henderson, of the Wellington-road Nursery, had several small plants in their cutting pots of Cantua bicolor, which were sent to show that it will bloom in a very small state, and along with them a light-coloured continental Gloxinia, called Frederick Leming.—Messrs. Rollisson, of Tooting, produced the pretty yellow-flowered Alpine Epimedium pinnatum, and a double-flowered dark purple Auricula called Primula auricula nigra plena. Also a well flowered plant of the Rhubarb-scented Dendrobium macrophyllum, a good specimen of Oncidium sphacelatum, and an example of Mr. Lowe's Cypripedium (C. Lowei), of which the accompanying woodcut is a representation. It is difficult to imagine anything more beautiful in its way than this Bornean Lady's Slipper. The lip is a purplish green, and smooth as if French polished; the sepals are green, with a purple tinge near their base; the petals are quite 3 inches long, spreading, and then curving gracefully inwards and upwards, narrow near the base, pale greenish yellow, blotched with deep brown, and rose-coloured at the ends, which are twice as broad as the other parts. It is said to be a plant of easy cultivation, and is a great acquisition. A Banksian Medal was awarded for these.—Mr. Glendinning, of the Chiswick Nursery, received a Certificate of Merit for a long-tubed, bright red coloured seedling Heath, apparently a cross between E. Hartnelli and E. aristata.—Various Orchids were exhibited. Messrs. Loddiges sent a pink-spotted Trichopilia from Costa Rica, for which a Certificate of Merit was awarded.—Mr. Williams, gr. to C. B. Warner, Esq., produced small examples of Oncidium tetrapetalum, Saccolabium denticulatum, Batemannia Colleyi, Cœlogyne cristata, and the long-tailed Cypripedium (C. caudatum). A Certificate of Merit was awarded for the two last plants

A fine branching cut spike of Ansellia africana was exhibited from Chatsworth. This Ansellia was stated to have been in blossom in the middle of January last, and to have continued in flower up to the present time.—Small bunches of Black Hamburgh Grapes, but well coloured and covered with bloom, were produced by Mr. Mitchell, of Kemp-town, Brighton, to whom a Certificate of Merit was awarded; and Mr. Higgs, gr. to J. Barchard, Esq., sent good examples of forced Keens' Seedling Strawberries.—Mr. Halliman, of Kensington, showed some glass "fruit protectors." They were shaped like common striking glasses, but were furnished with a moulding or rim round the mouth, in order to detain a piece of wire with which they were fastened to the wall, the fruit being previously placed inside the glass—Another invention was produced in the shape of Brown's fumigator, a representation of which may be seen in our advertising columns.

The tobacco is placed in the receptacle at top in the same manner as in an ordinary smoking-pipe. A draught of air is obtained for its combustion by the revolutions of a fan or wind wheel in the cylinder underneath, which has the effect of drawing the smoke in at the upper part and driving it out at the spout. In its transmission through the machine the smoke is cooled, being driven by the fan against the cold sides of the cylinder, and it is rendered thereby incapable of scorching the plants. The ejection tube or spout can be turned up or down, at the option of the operator. Houses or frames may be fumigated from the outside by passing the nozzle of the spout through a small hole in the door, or other aperture. Experience is wanted to test the real value of this, but at present it appears as if it would be extremely useful.—From the Garden of the Society came Henfreya scandens, two Cape Heaths, a red Azalea, three Oncids, Blandy's variety of Dendrobium nobile, the orange-flowered Epidendrum aurantiacum, Dielytra spectabilis, a beautiful Chinese Fumewort, which is expected to prove hardy, Boronia tetrandra, a species in the way of B. pinnata, and sold in the nurseries under the name of B. microphylla, two Acacias, Nuttallia cerasiformis, a green-flowered Californian shrub, of no beauty, five Cinerarias, Eutaxia myrtifolia and the sweet scented Rhynchospermum jasminoides.

April 3.—MEETING AT WORTON COTTAGE for the display and examination of seedling florist flowers and other productions.—A nice little collection of seedlings was placed upon the tables. Conspicuous amongst them were two noble trusses of seedling Rhododendrons, which, by the kind permission of the Duchess Dowager of Northumberland, were supplied by Mr. Iveson from the gardens at Syon. One of them was a pyramidal truss of 26 flowers, in character much like Cliveanum, but of a lighter ground colour, with darker spots and much less distributed than in that variety—very handsome and very fragrant. The other presented a fine head of flowers formed by five trusses massed together, of a rich crimson colour, and was a gorgeous object. Mr. Thomson, of Iver, sent several seedling Pansies—one, Penelope, was a flower of good size, white ground, broad belting of rich purple, top petals of the same shade, similar in style to Almazor, but superior to that variety in many respects. Mr. Turner, of Slough, exhibited his Mr. Beck, a seedling having a deep yellow ground, broad maroon belting, top petals of same shade, full size, edge exceedingly smooth, and good substance. Several other promising seedlings were shown with the above in Mr. Turner's stand of 24 varieties, amongst which we noticed, among older sorts, Ophir (Widnall),

remarkably fine, also Disraeli (Hunt), Supreme (Youell), Duke of Norfolk (Bell), Constellation (Thomson), Miss Edwards (Turner), Queen of England (Fellowes), Climax (Bell), and Model of Perfection (Chater).—Mr. Edwards, of Wace-cottage, Holloway, also supplied a stand of 24 varieties, equally fine in size and condition, which was extraordinary, considering the unfavourable weather we have so long had. Amongst them were Mrs. Beck, and Addison (Turner), Ellen (Hunt), Juventia (Hooper), and other favourite sorts.—Seedling Epacrises came from Mr. Story; one marked 2-49, a very fine blooming variety, of a peculiar deep crimson colour, was much admired; another, named Alba, was equally prolific in bloom, but inferior in several points to Hyacinthæflora candidissima, of which beautiful variety a branch was exhibited. Eclipse, a coloured figure of which will be found in the "Florist and Garden Miscellany," Vol. 1849, maintained its character; and another, 4-50, of a pale pink colour, is a free bloomer and delicately pretty.—Seedling Chinese Primulas were received from the Rev. A. Mathews; one, named "Superba," is a fine, rich, dark crimson variety; the others are of a curiously delicate mottled lilac colour—a pretty addition to the sorts in general cultivation.—Mr. Biddiscomb, gr. to C. Farrell, Esq., sent a very beautiful azure blue seedling Cineraria, named "Ultra-marine," and a rosy-purple variety—"Corinne," both of which we must see again. Two other raisers sent seedlings, but nothing worthy of particular remark, as they were inferior to the finest varieties in cultivation, a collection of which was on the table for the purpose of comparison. D. sent a pretty little seedling Cyclamen persicum, but it possessed no particular merit. Amongst miscellaneous plants were Gesnera bulbosa lateritia, bearing several spikes of light salmon-coloured flowers with purple spot on the throat; also Anguloa Clowesii, having several flowers of a bright yellow. An interesting feature of this plant is the singular manner in which the small labellum of the flower moves backwards and forwards, as on a hinge, with the motion which may be given it; these were supplied from Syon Gardens.—Haythorn's garden net, Turner's scissors, and Broom's fumigating apparatus were sent for inspection; the latter instrument was put in operation to fumigate a span-roofed house, 26 feet long by 14 feet wide; the pipe was introduced through a small hole made in the door, and in a few moments it was filled with tobacco smoke, most easily and most effectually, to the great satisfaction of the observers. The instrument used was of the largest size. We may mention, in conclusion, that the place in which the seedlings, &c., are placed for examination is a span-roofed erection, about 24 feet long by 10 feet wide, fitted with every arrangement for seeing them to the greatest advantage.

Linnean, *April 2.* — The President in the Chair.—Part of a paper was read by J. Miers, Esq., on the Natural order Triuridaceæ. After alluding to a paper by Captain Champion, on two new Ceylon plants related to Sciaphila of Blume in the "Calcutta Journal of Natural History," the author proceeded to describe the species of Sciaphila. He also described the genera Hyalisma and Soredium, the latter being the name proposed by the author for the plant called by Mr. Gardner Peltophyllum. The species of these genera have been found in both the Old and New World. The remainder of the paper will be read at the next meeting of the Society.

Garden Memoranda.

Mrs. Lawrence's, Ealing-park.—Generally speaking the plants here appear to be in a thriving condition. In the specimen house we observed some huge examples of Pimelea spectabilis covered with bloom buds. Some of these plants have not been repotted since they were last exhibited; nothing has been done to them beyond removing the decayed flowers, watering them when they wanted it, and top-dressing them with leaf soil. Polygala acuminata, 5 feet high, and as much through, was equally well furnished with flower buds, as were also Eriostemon buxifolium, E. neriifolium, E. myoporoides, Bossiæa disticha, plumosa, Adenandra fragrans, a pretty pink flowered kind, and many others. Beautiful bushes of Chorozema macrophyllum were in full blossom, as were also some nice specimens of Boronia pinnata. The New Holland house contained a large and fine Epacris grandiflora, and smaller plants of the beautiful Epacris miniata, and some other kinds. Boronia anemonæflora was in full blossom, as were also small plants of the pretty yellow spring-flowering Mirbelia grandiflora, Eriostemon intermedium, the best of all the Eriostemons, and the pale-green flowered Illicium religiosum. The large yellow flowered Gompholobium barbigerum was covered with flower-buds and promised to make a fine display. This is one of the handsomest species of the genus. We noticed here some admirably grown plants of Boronia serrulata, some 18 inches high, and as much through, thick and bushy, and supporting themselves almost without the aid of sticks. The seldom seen Chorozema ovatum was flourishing here in company with some beautiful Leschenaultias, which measured 2 feet through and almost as much high, though only shifted out of an 8 inch pot two years ago. Several of the finest specimen plants are already in the "retarding house" (a lean-to erection, having a north-west aspect), in order to keep them back for the exhibition at Chiswick on the 18th of May next. Among these one or two bushes of Chorozema Lawrenceanum, one of the best Chorozemas of its class, were in full bloom. Some large Epacrises, Pimeleas, Podolobiums, Azaleas, &c., also promised to do good service. In an intermediate house, which was filled with young stock, were nicely managed plants of Chorozema Dicksoni, Pimeleas, Boronias, red and blue Leschenaultias, &c. The comparatively new Ixora javanica was producing fine heads of rich orange flowers in a small stove, and the white trumpet flowered Portlandia grandiflora was also in blossom under similar circumstances. The Azalea-house was filled with nice specimens of that showy genus. The plants were in excellent health, and covered with flower-buds. The Heaths in the Heath-house generally looked well, and among them Willmoreana and nitida were in full blossom. The latter is a pretty, small, round, white-flowered variety, which should be in every collection. In the large stove on either side of the doorway were two beautiful plants of Begonia manicata in full flower; and, in front, a large white Indian Azalea. These were backed up by Francisceas, the brilliant Inga pulcherrima, than which, when well-flowered, nothing can look handsomer; the red-berried Ardisia serrulata, and other plants. Passing through the stove we enter the Orchid-house, which is divided into three parts by means of glass partitions, the centre being the "Amherstia house." The elegant stove tree Amherstia nobilis, which Mrs. Lawrence was the first to flower in this country, fills one end of this division. It blossomed last year about this time, and it is now in flower again. One spike has been cut, and two more are coming forward. The flowers are individually large, as will be seen by the annexed woodcut, rosy pink, and scentless, with the vexillum (*a*)

and two wings (*b*), tipped with yellow. They are borne in loose pendulous bunches beneath the profuse and elegant foliage. Behind it were Palms and plants of that kind, and the back wall of this house is covered with Ferns, the lively green colour of whose fronds, contrasted with that of the other plants, had a fine effect. In front of the Amherstia is a small piece of water containing aquatic plants, rockwork, and gold fish, and it is ornamented about the edge with a low ledge of rockwork covered with Ferns. On the shelves in this division of the house were some nice Ferns in pots. Among Orchids we observed noble specimens of Aerides, Stanhopeas, Cattleyas, Sobralia macrantha, and many other sorts. Some were in flower, but among them was nothing remarkable, except the long-tailed Lady's Slipper, which was still in blossom. We may mention, for the information of those who buy newly imported Orchids, that as soon as they are received here they are fastened to boards of charred cork and hung up against the wall of the house; the plants themselves receive no water for a time, but the surface of the cork to which they are attached is kept slightly damp. Under this treatment they soon recover from the effects of their journey. Two new avenues, about 28 feet broad, have been formed on the lawn since we last visited this establishment. One is planted with Araucaria imbricata 25 feet apart, to be intermixed with Cypresses and Junipers; and the other is formed of Hollies, Pinuses, Irish Yews, and Arbor-vitæ, &c. These avenues intersect each other at about right angles, the object in view being to convert the lawn, as far as practicable, into a Pinetum for select Conifers.

Miscellaneous.

On Drying Specimens of Flowers.—As the season for collecting plants is approaching, may I be permitted to give the particulars of the process I have adopted in drying specimens for the Hortus Siccus, especially the more delicate and succulent ones, for which I have found it peculiarly adapted, as it combines the greatest equality of pressure with despatch in drying. My method is as follows:—The apparatus required is very simple, consisting of a few canvass or linen bags, of such size that, when laid flat, they will rather more than cover a sheet of demy paper, a quantity of clean sand, an old saucepan, or other convenient vessel, to heat it in, and a few quires of blotting-paper. Having provided these, first put a sufficient quantity of sand in the saucepan, over the fire, and, while this is heating, take a quire of blotting-paper, on which arrange the plants, covering them with two or three sheets of blotting-paper. When the sand is sufficiently heated, and uniformly so (which may be promoted by stirring it with a stick), pour into one of the bags enough to fill it to one-third. The mouth of the bag being closed, by tying or folding back, it is then to be laid carefully over the plants arranged between the paper, and the sand contained in it to be spread out by the hand, and pressed with a board, so as to form a flat uniform surface. This process may be repeated, several layers of paper, plants, and sand-bags being laid on one another. If this is done, no extra weight will be required—the smallest and most delicate plants being placed in the uppermost layers; but if the subject be large and thick, a board and weight will be generally necessary. Unless they are very thick and succulent, in which case they may require a second application of hot sand, the plants will generally be found quite dry within twenty-four hours, and often much sooner. This is one advantage; as, by this rapid desiccation, the colour is preserved in the greatest perfection—*i. e.*, if the temperature be well regulated. The second, and perhaps of more importance as regards the botanical value of the specimen, is, that the sand, by adapting itself to the inequalities of the object under pressure, prevents any crushing of the stems, receptacles, &c.; while the parts of the leaves in juxtaposition with a hard, thick stem, which, by the ordinary method, escape any pressure, and consequently shrivel up, are all equally flattened. *W. S. Coleman, in Pharmaceutical Journal.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Heaths and other hard-wooded greenhouse plants should be potted as they require it. Generally speaking the most suitable time is immediately after they have done flowering, the energies of the plants being directed to the formation of a new growth; but the operation may be performed with propriety at any season when the roots are making progress, without being induced thereto by unnatural excitement. Before potting, take care that the old ball is sufficiently moist; for if it is potted in a dry state, it will be impossible afterwards to moisten it properly, without souring and saturating the new soil. The Epacris family is now so numerous, so beautiful, and so valuable for winter flowering, that for country establishments they outrival Heaths. Let them have all possible attention in repotting, and let them be kept rather close and moist, until they have commenced a free growth. At this season we give these plants a slight forcing; and they amply repay us for this more liberal treatment, by a splendid growth and abundance of early flowers. As soon as the flowering is over, the future shape of the plants should be adjusted, by removing a portion of the old flowering stems; and, that their energy may be devoted solely to the growth of the plant, seeds should never be allowed to come to maturity, unless they are very valuable. Let climbers both in pots and borders have due attention with regard to training, and retain no more shoots than the allotted space will afford room for. A succession of Achimenes, intended to flower late in the autumn, should now be placed in heat, and treated according to the directions given in former Calendars. Some of those of former successions may be potted for hanging vases, for which the A. longiflora and cupreata are particularly adapted. Pans or broad shallow pots are preferable for their general cultivation, and, as they require an abundant supply of moisture when they are in flower, let the drainage be very perfect, that they may be freely watered without stagnating the soil.

Conservatory.—Besides the permanent plants in this structure, many choice plants in pots will be required to keep a succession of gay flowers throughout the summer. Amongst the finest for this purpose are Brugmansias, Erythrina Crista-galli, Thunbergias, Achimenes, Ipomœas, with Heaths and Geraniums. Let these have all possible attention, and bring them forward in several lots, so that one set may succeed another. Pay particular attention to the Liliums now in pits, by giving them a liberal supply of water, and by neatly staking them. A top dressing of turfy peat, sand, and well decomposed cow-manure will be of great benefit to them; and they will be very useful for conservatory

and drawing-room decoration late in the autumn. Let Fuchsias, which are so useful for summer and autumn flowering in the conservatory, be repotted, as they require it, in rich compost; watering them occasionally with liquid manure. Nearly all the varieties have a natural tendency to form conical bushes, and by a very little attention they may be guided into this appropriate form; one strong shoot should be selected to form a leader, and should be trained perfectly upright; the remaining shoots being regulated by stopping any which are growing more luxuriantly than is consistent with the proper shape of the plant. VIOLETS.—These are everybody's flowers, and therefore well worth a little attention to produce them in first-rate excellence. A frame of light rich compost, consisting of loam and leaf-mould under the shade of a north wall, should be prepared for their summer quarters; as in such a situation they are more easily preserved from the ravages of the red spider, which will certainly attack them if they are exposed to scorching sunshine. In this frame the offsets from the old beds should be planted about 4 inches asunder, and the sashes placed over them till they have begun to form new roots. The best varieties are the Neapolitan and the Tree Violet.

FORCING DEPARTMENT.

PINERIES.—Keep up a high day temperature to fruit which are now swelling, and admit air freely, so that a circulation may be produced to resemble the sea breeze of their native isles. If the latter be not attended to, the plants will grow weakly, and have an unhealthy drawn-up appearance; and, with regard to fruiting plants, the crowns will increase in size, instead of the fruit itself, which will be watery and deficient in flavour. Take advantage of every fine afternoon to syringe the pits, and close them for two or three hours before sunset. Remove all gills and useless suckers, that the whole energy of the plant may be occupied in perfecting the fruit. VINERIES.—Successional Vines which are just starting may be indulged with a good heat, and particularly Muscats which were ripened late last year, as the wood of such is not generally so well matured as that of the earlier forced Vines; and unless they are encouraged by a temperature rather higher than usual, until their blossoms are fairly set, the shows for fruit, however strong they may be to all appearance, not unfrequently prove abortive. A somewhat higher temperature is not only admissible but beneficial, through the whole routine of starting and forcing Vines at this season, than would be safe or prudent two months earlier, accompanied of course by a proportionably liberal circulation of fresh air to prevent the scorching which is so much complained of. Attend punctually to the stopping and training of the shoots, and thinning of the berries on the Vines, in the earlier stages; maintain a moist atmosphere by evaporation where the berries are swelling, particularly in fine clear weather, but this must be moderated as soon as they begin to change colour, and air must be more freely given. PEACHES.—Let all very vigorous growths be stopped as soon as they have made six or eight leaves, to divert the flow of sap into the weaker growths; this is a much better plan than allowing them to make long Willow-like shoots, to be removed by the knife at the end of the season. Avoid a high night temperature, or the fruit, though ripened considerably earlier, will be obtained at a sacrifice of size and flavour.

FLOWER GARDEN AND SHRUBBERIES.

BEDDING PLANTS.—Lose no time in potting off, or pricking out into frames or boxes, young cuttings as soon as they are sufficiently rooted, and seedlings as soon as they will bear handling. As the potted off plants become established with new roots, they should be gradually inured to the open air. The hardier kinds if in pots may be set upon a bed of coal ashes, or plunged in the open air, and protected at night by hoops and mats. If plunged in old tan, ashes, or some other light material, much of the labour of watering will be saved, and the plants will be in a better state when planting out season arrives. But, as we mentioned in a former Calendar, the most economical plan is to plant them out in frames, and, at the proper season, to remove them to the beds with balls. Patches of some of the more showy of the hardy annuals should now be sown in vacant places, which usually exist in the herbacous beds and in the edges of clumps and borders in the Shrubbery. Among the many kinds excellently adapted for this purpose we may mention the following:—Double Poppies of various colours, Lupins, Sunflowers, African and French Marigolds, Godetias, Erysimum, Clarkia, Gilia, Collinsia, Silene, Eschscholtzia, Nemophila, Nolana, Kaulfussia, &c., not forgetting the old fashioned favourite Mignonette. A sufficient quantity of cuttings and seedlings of half-hardy climbers should now be potted for planting out in May; with such plants as Cobœas, Maurandyas, Lophospermums, Calampelis, Loasas, Tropæolum canariense, &c., many bare places on the walls and trellises may be covered and made ornamental, which would otherwise be unsightly blemishes on the general appearance of the place.

FLORISTS' FLOWERS.

DAHLIAS.—Continue to put in cuttings as they get long enough: they will now strike root readily. Pot off those which are already rooted, and place them in a close frame for a few days. When they have "rallied," the frame may be opened by tilting the lights, and from this period every care must be taken that they are not drawn. Healthy stiff plants are always in requisition, being planted out with greater safety, and are less susceptible of frost and wind than those which have been more tenderly dealt with. AURICULAS.—Critical is now the period of the existence of these beautiful flowers. The slightest neglect, in the way of covering, would be attended with serious results. Water freely in fine weather; give all the air possible. Before the buds expand, showers of gentle rain will be highly beneficial. Look over the trusses, and, with a sharp-pointed pair of scissors, cut away all imperfect and superfluous buds. The same advice may be taken in regard to Polyanthuses. CARNATIONS.—Pot off without delay, and, for the first fortnight, give them all the protection possible from cutting winds.

KITCHEN GARDEN.

Continue to make periodical sowings of the different culinary vegetables, of which a successional supply is required. Spinach should be sown once in a fortnight; and Peas, Beans, and Turnips, once in three weeks; sowings of all Salads should be made with strict regularity; and proper attention should be paid to protecting all kinds of seeds from the ravages of birds and insects. If the crops of Onions, Leeks, Parsnips, Beet, Salsafy, Scorzonera, and Skirret, are not yet sown, it should be no longer delayed; and the main crop of Carrots should be sown this month if the ground is good. A sowing of tall Kidney Beans may now be made in early localities; the early sowing of this useful vegetable not unfrequently gets cut off by late spring frosts; but when this happens the ground should be left undisturbed, as that part of the plant beneath the surface of the ground generally throws up shoots, from which a crop will be produced nearly as soon as it would have been if the leaders had remained uninjured. In sowing Peas, it is the most workmanlike method to put the stakes to them at once. The barren appearance of the ground is thus removed, and no more trampling on it is necessary for a long time; besides which, they afford a slight shelter to the young plants on their first appearance above ground. Transplanting of autumn-sown Cabbages and Cauliflowers should be finished, and the spring-sown ones encouraged. FORCING VEGETABLES: FRENCH BEANS.—Let these have an abundant supply of water at the roots, and use the syringe freely amongst the foliage; no description of plant is more liable to be infested by the red spider; and if other species of plants are grown in the same house or pit, it is scarcely possible to prevent the spread of the disease. When the structure in which they are growing is heated by other contrivances than flues or hot-water pipes, a wash of lime and sulphur should be applied to the walls in the inside, especially upon those parts upon which the sun can shine; the fumes arising therefrom are very efficacious in destroying the red spider.

State of the Weather near London, for the week ending April 4, 1850, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

BEES: *Peebles Bee-keeper.* If you will refer again to "Y.'s" remarks you will find that it is not thought advisable to feed bees unless there is convenience for doing so at the top of the hive. The feeder is covered with a piece of glass, and then by the straw cover, as when used over a glass or cap, by which means no scent of the artificial food gets abroad to attract stranger bees, and those alone intended to be fed have all the advantage. The placing of food abroad must not be considered as only feeding one's own stocks, but as a general feeding of all the stocks belonging to one's neighbours within a circle of at least half a mile. A most praiseworthy act, but, to be carried out with a chance of being of any benefit to any one hive, rather costly. "Y." certainly "says nothing about closing the door of the hive," because it is an appendage to their domicile they will not brook on this side of the Tweed. English bred bees must and will have free egress and ingress to their castle at all times and seasons, and the attentive English bee-master merely opens or contracts the entrance to the hive according to the season, or to assist them in defending their stores from plunderers, and has no fear that his industrious and well regulated large little family will ever, under any circumstance, neglect the duty at the time appointed to them but with loss of life, and that they will wait their proper turn in partaking of the food offered them. If you are "a gardener, and grow Asparagus and Seakale, manuring the same by sprinkling salt over the beds in the spring," your bees will soon give you ocular demonstration of their desire for it; but if you do not so manure your Asparagus, and will do as directed by "Y.," you will soon find your pans of brine thronged by them. For "cup," twice at page 200, col. *b*, read "cap." *Y.*

BOOKS: *Novice.* Any bookseller will answer your inquiries. We cannot reply to mere trade questions. Paxton's Dictionary does *not* give the pronunciation of names, and it would only mislead you, as all such schemes do, if it pretended to it. It gives the *accents*, which is all that you need; and is a catalogue. Use carbonate of ammonia once a week, and always in cloudy or damp weather, if you can.—*P O J.* Dr. Lindley's "School Botany."

CAMELLIAS: *P O J.* Your Camellias which have just done flowering should be kept a little warmer than usual till they have made their wood and set their flower buds. A moist top heat of 60° will suit them while they are growing; they need no bottom heat. Whether they require repotting or not can only be determined by inspection; but if you do not repot them, a little *weak* guano water given them now and then might prove of service. ‡

GLASS: *R.* Rolled rough plate-glass is coming into general use for conservatory roofs, much exposed to the sun, as a preventive of burning. Its excellence has now become a matter of certainty.

GLAZE FOR CALICO: *R C.* Three pints old pale linseed oil, 1 oz. sugar of lead, and 4 oz. white resin. The sugar of lead must be ground with a small quantity of the oil, and added to the remainder, incorporated with the resin by means of gentle heat. Lay it on the calico with a brush. One coat annually is sufficient.‡

LINARIAS: *A H.* It is possible, but not probable, that your seedlings may push again. All depends upon the vigour of the cotyledons and their power to generate fresh buds in their axils. Cupressus macrocarpa is more hardy than an Ash tree.

MAGNOLIAS: *J S.* The best of the varieties of Magnolia are those with a brown down on the under side. The broader the leaves the handsomer are the sorts. They are all equally hardy, or if there be a difference the downy ones are the most so.

MARKET PLANTS: *W H P.* You are very late for the market. At present you may force Seakale, Kidney Beans, Rhubarb, and take a crop of Grapes, but the produce will not fetch much, now that the warm weather of spring has come on. All your preparations for forcing should have been made in January. If your house is adapted to the purpose, you may perhaps add Cucumbers and Melons.

NAMES OF PLANTS: *Reader.* 1, Athyrium axillare; 2, Lastrea affinis; 3, Lastrea affinis; 4 (?), Asplenium viride; 6, Lastrea patens; 7, Asplenium ebeneum; 9, Lastrea Fœnisecii. *S.—Erzeroum.* 600, Tussilago Farfara; 626, Elæagnus orientalis; 633, Oporanthus luteus; 642, Rhododendron caucasicum; 644, Rhod. ponticum; 678, Cyclamen cöum; 683, Veronica Chamædrys; 693, Cornus sanguinea; 686, Vinca major; 716, Anagallis arvensis; 727, Chelidonium majus; 735, Potentilla fruticosa; 764, Datura stramonium; 437, Castilleja; 260, Butomus umbellatus; 237, Cicer arietinum; 601, Equisetum arvense; 602, Oporanthus (?); 603, Pedicularis; 632, Spiræa filipendula; 646, Pinguicula vulgaris; 680, Leucoium æstivum; 687, Staphylea pinnata; 694, Periploca græca; 698, Viburnum Opulus; 752, Plumbago europæa; 760, Cleome ornithopodioides; 769, Atraphaxis spinosa.—*Enquirer.* 1, Hippeastrum aulicum; 2, H. vittatum; 3, Phaius grandifolius; 4, Phaius, unknown to us, and apparently new; can you supply a good specimen, with the history of the plant? 5, not recognised. Six good Begonias are coccinea, fuchsoides, manicata, parviflora, nitida, and ramentacea.—*A Regular.* It is Phormium tenax and *not* hardy. You are not to blame for the plant having died. It will no doubt stand mild winters but not hard ones. Edwardsia grandiflora.—*Y.* We presume it is a bit of Lachnæa tetragona.—*J T.* Seems to be nothing more than Malva pusilla—crushed to pieces.

OIL SEEDS: *J W M.* Til is the Guizotia oleifera, Sesame is Sesamum indicum; of Chinchilla we have never heard. The two first are very important oil-plants. We prefer the Beechwood Melon.

ORCHIDS: *T D H.* As *general* rules to persons abroad sending home these things, the following are the more important:—1. Collect them just as they are going to rest. 2. Pack them in chests with thick sides, well closed up, and if Usnea is to be had strew it among them; if not, any sort of *dry* leaves or shavings may be used. 3. Send them home as quickly as possible; they should not be more than three months on their passage. 4. Above all things take care that they are *not put into the hold*, nor, if in a steam-boat, anywhere within the reach of the heat of the furnace and boilers.

PICOTEES, &c.: *J W.* Next week.‡

POTATOES: *W Street.* We will try the Potatoes, and after the crop has been raised give you our opinion of them.

RAISING POTATOES FROM SEED: *Sub.* See pp. 118, 176, and 239, vol. for 1847. Sow now on a slight hotbed. When up air freely on fine days, and water sparingly. Transplant as soon as all danger of frost is over.‡

RUSSIA MATS: *Protector.* There are conveniences in Russia mats which are not afforded by other kinds of covering. What is wanted is that they should be two or three times as thick. For *mere protection*, frames thatched with straw, or *paillasses* such as French gardeners use, or frames covered on both sides with thick felt or asphalte, are preferable. Any of these may be made at home.

SASH-LINES: *R A H.* The wire lines do not answer. Chains are sometimes employed; but upon the whole the patent sash-line is the best and cheapest, especially if previously steeped in a tan-pit. In an ordinary forcing house a bottom heat of 50° is ample.

SEEDS: *L B S.* If we received the question we certainly answered it. We answer *all* questions. In the North of India every kind of European seed is welcome, provided it is of very fine quality. Seeds of *fine* vegetables, *fine* fruit trees, *fine* varieties of common flowers, Fuchsias, and plants from America that ripen seeds in England. Send them in packets, loose in a canvas bag, suspended in some passenger's cabin. On no account put them into tin. You must start your Hyacinths in dampness and light, not in water or wetness, nor must you feed them until their growth has been fairly established. Then water them with water containing a *minute* quantity of carbonate of ammonia and saltpetre. Hollies, Camellias, dwarf Conifers, Yews, evergreen Oaks, Ivy, Laurustinus, Laurels, and all such things.

STRAWBERRIES: *N C.* The plants seem to have died from the opposite of too much wet. They have been potted in poor light sandy stuff, incapable of retaining sufficient moisture for any length of time—"never staying five minutes" you say. You should pot in well-enriched friable loam.‖

VENO BENO: *Emily.* This material is probably the ground leaves of the common Rhubarb, taken out of market gardens when they are of no other use than to be conveyed to the dunghill.

VINERY AND COWHOUSE: *Llandilo.* Why not call it the Grape Cowhouse or the Garden Cowhouse?

VIOLETS: *Lancashire.* The Neapolitan is the best for forcing. The Russian is most suitable for planting out of doors. They succeed in any light rich soil.‡

YEW HEDGES: *Lopez.* In trimming them, manage so that the top is only half the breadth of the bottom. The Snowdrops *may* be too deep, but it is more probable that their leaves were destroyed last year before they had withered.

WEEPING WILLOW: *W B.* Pruning has not hurt your Willow. It is more likely that the roots are injured. At the same time such appearances are very common in this tree after hard winters. The *causes* can only be judged of by inspection.

MISC: *Sub.* Pigeon dung is a powerful manure, and should be used with caution. If it is given to Carnations, Picotees, &c., it must be in water. Apply it now and then in June, to assist them in throwing up their blooming shoots; but it must not be strong. The *Gardeners' Chronicle* cannot be supplied *without* the Newspaper. We know nothing of the party you mention; you had better, perhaps, apply to him again.‡

FLORISTS' FLOWERS.

POLYANTHUSES: *H H.* All crushed and withered up when received. They should have been sent either in damp paper or moss, and in a stronger box.*

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

EDENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed charged, from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.

HOT WATER APPARATUS AND HORTICULTURAL BUILDING.

WHILL begs respectfully to announce that his improved "FLUE BOILER" may now be had in sizes to suit every description of Apparatus, from that of 100 feet to 2000 feet of 4-inch pipe. Improved STEAM BOILERS, from one-horse power and upwards, adapted either for stationary or portable engines, and guaranteed to be most effective.

Every description of Horticultural Building constructed upon the best principle. Buildings of any kind heated by hot water.

*** A liberal Discount to the Trade.

W. HILL, Horticultural Works, Greenwich.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers; Office, 70, Strand, London.

Works, Sumner-street, Southwark-bridge-road.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

CROGGON'S PATENT ASPHALTE ROOFING FELT has been extensively used and pronounced efficient, and particularly applicable for warm climates.

1st. It is a non-conductor.

2d. It is portable, being packed in rolls, and not liable to damage in carriage.

3d. It effects a saving of half the timber usually required.

4th. It can be easily applied by any unpractised person.

5th. From its lightness, weighing only about 42 lbs. to the square of 100 feet, the cost of carriage is small.

Price One Penny per Square Foot.

CROGGON and Co.'s. PATENT FELTED SHEATHING for COVERING SHIPS' BOTTOMS, &c., and NON-CONDUCTING FELT for STEAM BOILERS, PIPES, &c., preventing the radiation of Heat, and saving 25 per cent. of Fuel.

Samples, testimonials, and full instructions, on application to CROGGON and Co., 2, Dowgate-hill, London.

FLEXIBLE INDIA-RUBBER HOSE PIPES.

JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING. These Pipes are well adapted for watering Gardens, conveying Liquid Manure, for Breweries, Gas Fittings, Chemical and all purposes where a perfectly sound WATERPROOF and FLEXIBLE PIPE is required. Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently flexible in all temperatures, and are therefore particularly suitable for Fire-Engines; and from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes. Being extremely portable, stowing closely without danger of injury, resisting the influence of climate, insects, and vermin, frequently so injurious to such articles on board ship, and retaining their virtues though long out of use, render them particularly adapted for exportation.

N.B.—VULCANISED INDIA-RUBBER GARDEN HOSE, fitted with Roses, Jets, and Branches, complete, with Union Joints, ready to attach to Water Cisterns.

All letters or Orders addressed to J. L. H. at the Manufactory and Warehouse, Goswell-mews, Goswell-road, London, will meet with immediate attention.

IMPORTANT TO AGRICULTURISTS.—COLLECTION AND DISTRIBUTION OF MANURES.

STRATTON'S AGRICULTURAL REPOSITORY, BRISTOL.

STRATTON, HUGHES, AND CO., have now ready their PATENT TUMBLER CART for the collection of Night-soil and other offensive matters; also their Iron Mill, to be worked by horse-power, water-power, or steam, for mixing and incorporating Nightsoil with Charcoal and other deodorisers. The Tumbler Cart has an iron body with a close cover; can be fitted if required as a Watering-cart, with a Valve and Delivery Pipe for distributing water or liquid manure, and also with an Apparatus for distributing dry manures in any given quantities per acre.

STRATTON, HUGHES, and Co.'s Tumbler Carts are used for scavenging purposes in Manchester, Bristol, Worcester, Harwich, Rochford, Cardiff, &c., and they are now building them for Chester, Oxford, Huddersfield, &c., besides many for Agricultural Colleges and private individuals. STRATTON, HUGHES, and Co.'s new illustrated Catalogue of Carts, Waggons, and Agricultural Implements will be forwarded to any address on receipt of 1*s.* 6*d.* in postage stamps.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

Corn and Grass Manure, per ton	£10 0 0
Clover Manure, do.	11 0 0
Turnip Manure, do.	7 0 0
Superphosphate of Lime	7 0 0
Sulphuric Acid and Coprolites	5 0 0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

LAWES'S PATENT MANURE.

WILLIAM E. RENDLE AND CO., Plymouth, are Mr. Lawes's Wholesale Agents for the Sale of his MANURES, and can supply them at Mr. Lawes's prices, delivered at his Factory, Deptford Creek.—Apply to WILLIAM E. RENDLE and Co., Union-road, Plymouth.

POTTER'S GUANO.—This effective MANURE, now greatly Improved, is confidently recommended as a Dressing for all Spring Crops. It is equal to Peruvian Guano, and 25 per cent. cheaper. Also SUPERPHOSPHATE of LIME, GYPSUM, and SULPHATE of AMMONIA, all of guaranteed quality, and Cheaper than at any other establishment in town or country.

Factory, 28. CLAPHAM ROAD PLACE, LONDON.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.

London, March 9.

CORN MANURE.

BLASHFIELD'S PATENT COPROS.—A new Manure for Corn and other Crops, containing Ammonia, Phosphate of Lime, Potash, Soda, Magnesia, Silicate of Potash, &c. Price, delivered alongside a vessel, or any Wharf in London, 8*l.* per ton. It is sold in a finely-ground dried powder, by the Patentee, at No. 3, New London-street, Mark-lane, London.

Superphosphate of Lime, Gypsum, Sulphate of Ammonia, Sulphate, and Nitrate of Soda.

CORN MANURE FOR WHEAT, BARLEY, OATS, BEANS, &c., &c.

THE LONDON MANURE COMPANY most confidently recommend the above, as they are daily receiving very satisfactory accounts from parties who used it with great success last season. It will be found fully equal to and much cheaper than Peruvian Guano, and is not so liable to produce so large a growth of straw. Price Seven Guineas per ton, 3 cwt. per acre. They also beg to offer their Concentrated Urate, Superphosphate Lime, Nitrate of Soda, Sulphate and Phosphate of Ammonia, Fishery and other Salt, Gypsum, Sulphuric Acid, and genuine Peruvian Guano. To insure this free from adulteration, all purchasers can receive it direct from the Warehouses of the Importer.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.

Country Dealers and Agents supplied.

The Agricultural Gazette.

SATURDAY, APRIL 6, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, April 10—Agricultural Society of England.
THURSDAY, — 11—Agricultural Imp. Society of Ireland.
WEDNESDAY, — 17—Agricultural Society of England.
THURSDAY, — 18—Agricultural Imp. Society of Ireland.

A PROFESSIONAL MAN will do the thing more cheaply than an amateur, whatever the thing may be; both because of the more economical methods which his experience has taught him, and because of the more perfect result to which his educated skill will lead him. An extensive operation may be executed more cheaply than one of limited extent, because, independently of the cost per unit of measure, which is in the two cases the same, there is a certain expenditure of time or superintendence, or machinery, which is relatively far greater in the smaller than in the larger instance.

On these two grounds, no doubt, the principle of Mr. C. LEWIS's bill for the better management of HIGHWAYS may be amply vindicated. To place the highways of each Union under the superintendence of an experienced officer, appointed by the guardians of the poor, is likely to be a great improvement, whether as regards cost or efficiency, upon the system which places the highways of each parish annually under the superintendence of a new man—of one, indeed, who frequently knows nothing of road management whatever. The subject is of material importance to the farmer, for he pays directly large sums every year as his share of the expenditure incurred, and, indirectly, still larger sums as his share of the injury sustained under the present miserable result of it. Messrs. STRATTON and Mr. CROSSKILL have laboured, perhaps successfully, to send out carts which, at a minimum expenditure, whether of force or of cash, shall carry a maximum of load; but whether the farmer be supplied with these or not, bad roads in all cases enforce short loads and occasion heavy repairs. Another point of equal if not greater importance in any general system of ROAD REFORM, is that which concerns the method of collecting the requisite funds. For the Grass land farmer, because he pays as large a rental, to be called upon to pay as large a contribution for the maintenance of the parish roads as the arable farmer who employs three times the number of horses, seems manifestly unjust. And as regards turnpike roads, where an *ad valorem* taxation is more accurately attained, the system of collection adopted labours under the imputation of being the most expensive possible. Mr. PAGAN, of Fifeshire, has had the merit of drawing attention to this subject, and of suggesting a direct tax upon horses for the maintenance of all roads, as in every respect superior to the imperfect and wasteful method now followed. We called attention, some time ago, to the facts on which he rests his case. The subject caused at the time of its promulgation considerable excitement in Scotland, and though now comparatively in obeyance, it still deserves serious attention. And having lately obtained the road statistics of a considerable district in Gloucestershire, which bear out many of Mr. PAGAN's proposals, we shall endeavour next week to bring the subject fully before our readers.

WE learn from the *Bucks Advertiser* that the farmers attending Hertford market lately held a meeting for the purpose of reducing the payments made to tradesmen for work performed by them. And it was resolved that, "As the value of agricultural produce has fallen so low, that farmers in general must adopt a system of wise and vigilant economy, extending to every branch of expenditure unavoidably incurred, and that accordingly the tradesmen in this neighbourhood be requested to reduce their charges in the following ratio:

Blacksmith to ...	6*d.* per shoe.
,, ...	3*d.* removes.
,, ...	6*d.* coulters.
(All ordinary work 15 per cent.)	
Collar-maker reduced by ...	15 per cent.
Wheelwright ...	20 per cent.
Carpenter, reduced to ...	3*s.* per day.
Bricklayer ,, ...	3*s.* per day.
Ditto labourer ,, ...	1*s.* 8*d.* per day.
Hurdle-maker ,, ...	3*s.* 6*d.* per doz.
Thatcher ,, ...	9*d.* per square foot.

"Resolved,—In order to carry out the above resolution, an association be formed in this district, including the parishes of Ware, &c. Resolved,—That the tenant farmers in the neighbourhood be invited to become members of the association. That the members determine not to employ any tradesman whose prices do not conform with the above scale. That the landowners be requested to give their assistance in furtherance of the object of this association."

Now, unquestionably, where employment of the kinds named is sufficient in quantity to maintain a number of the employed, the competition among these will soon of itself give the employer the advantage of any reduction in their expenses; yet he is quite right to insist upon the reduction being immediately submitted to, and if the demand be reasonable, the threat of employing other hands will at once successfully enforce it. And this being right in individual cases, the subject seems perfectly proper for entertainment by an association. Whether the precise reductions insisted upon be those to which the natural process of competition would ultimately lead, and below which no amount of arbitrary enforcement can in the long run be influential, we do not know; but the mere fact of an association being formed to ensure that the whole effect of reduced prices be not borne by the farmers' shoulders will, of itself, tend to distribute the burden. And we refer to the matter here, because the principle guiding the resolutions which have been arrived at by the farmers of Hertfordshire, and by others who have met with the same object in view, at St. Peter's in the Isle of Thanet, and elsewhere, seems deserving of general adoption.

WE refer once more to the circulars lately issued on the subject of AGRICULTURAL LABOUR, for the purpose of asking the assistance of any who, though not personally applied to, may yet be willing to furnish information on the subject. The following are the questions which the circular asked:

I. As regards DAY WORK: What are the—
  1. Present wages of able-bodied men per week.
  2. Their wages during harvest month.
  3. Perquisites, as beer, &c., in addition to (1).
  4. Wages of female labourers.

II. As regards PIECE WORK: As specimens under this head the following instances are chosen. What is paid for,
  1. Mowing Clover per acre.
  2. Mowing Meadow Grass per acre.
  3. Reaping and tying Wheat per acre.
  4. Threshing and cleaning Wheat per bushel.
  5. Digging drains; say 3½ feet deep, 14 inches wide at top, and 3 inches wide at bottom. Clay subsoil, free from stones.

Of course any further information bearing upon the condition of the labourer, including the particulars of House-rent, Garden, Allotment, Schools, &c., would be most acceptable: but the main purpose of the inquiry is to ascertain the wages in different parts of the country, in order to see how the condition of the labourer is affected by the different circumstances amid which he is placed. If any one will kindly furnish answers to these questions, specifying the locality of which his answers are true, and adding his own name and address, we shall be greatly obliged.

TO INTENDING EMIGRANTS.

A PERSON who intends emigrating ought to consider well what his prospects are likely to be in the country of his birth, and in the district to which he is to move, and be guided by a balance of their advantages and

disadvantages. The influence which wealth has attained in Britain merits the consideration of all young men without capital. Personal exertion is often considered degrading, and visited with the contumely of former associates. In the remoter parts of America wealth is not idolised. The industrious youth may therefore follow any occupation without being looked down upon or sustain loss of rank, and may occasionally anticipate raising himself. The plain style of buildings and household furnishings of such places are favourable to young people, and in almost every particular their situation may be said to be the reverse of what it is in Britain. A young man without capital and of good character is almost sure to gain but cannot lose rank by emigrating to America, and will rarely retain his rank by remaining in Britain. Farming in most parts of the world ranks low in the scale of professional remuneration, and in America, as elsewhere, I cannot hold out an immediate or ultimate prospect of great wealth, as the low price of produce and high labour renders this improbable. Animals of every description are not to be compared even with the second and third class breeds of England, and no great improvement can be effected with them until proper winter food and shelter are supplied. The want of Grass and root crops is one of the greatest privations of first settlement. In the old cultivated districts manure is sometimes applied to land; gypsum is frequently used successfully to Clover and Indian Corn. The robbing system has long been followed, and its effects are everywhere apparent. I do not think that lime is often tried. It is better to restore the most exhausted than clear forest land of the same quality. Nature never becomes exhausted, and the farmer has only to do his part to obtain her bounty. It has often been said by writers on emigration that manufacturers and artisans of all kinds make better Canadian farmers than agriculturists do. This seems to me part of the deception which has been played off on the people of Great Britain. Knowledge is power in all things, and however prejudiced agriculturists may be, their acquaintance with the time and mode of sowing, harvesting, and many et ceteras, must give them advantages over other classes. I can conceive few situations more trying than a person without capital totally unacquainted with farming placed in the midst of a forest to live by his own exertions. The man without capital ought to consider well before engaging with forest land, however cheap and advantageous the terms may appear. Almost all who do so can scarcely avoid being ruined. The soil on the eastern side of the Alleghanies on the Atlantic is generally of an inferior description, with the exception of lands on the banks of rivers; the cleared lands having been long cropped under the robbing system, and far from being productive. The prices of farms with their tenements varies from 5*l.* to 30*l.* sterling per acre. Labour can at all times be had, and every description of produce finds a ready market. Manures are chiefly employed in growing vegetables; market gardening, early fruits and vegetables, is the most profitable department of farming, and the growing of Grass ranks next.

Land which has been impoverished by a long succession of crops under this robbing system, will not yield much grain without a plentiful supply of manure, which the rate of labour may frequently prevent being applied without incurring loss. Suppose an acre of Wheat to yield, with a moderate application of manure, 24 bushels of Wheat per acre, which is worth one dollar or 4*s.* 2*d.* per bushel, the cost of producing the crop, including twice ploughing, harrowing, seed, sowing, harvesting, and carrying home, threshing, dressing, and marketing, will amount to 2*l.* 18*s.* 4*d.*, leaving only 10 dollars, or 2*l.* 2*s.* 6*d.*, to meet the interest of capital employed in the purchase and cultivation of the land, taxes, professional profit, and the purchase and application of manure. If the purchase-money of the land and capital invested in cultivation amount to 60 dollars, that is, 12*l.* 15*s.* per acre, the interest may be taken at 16*s.* 8*d.*, leaving only 1*l.* 5*s.* 6*d.* sterling for taxes and manure. The cost of manure may be estimated—gypsum 4*d.* per bushel, but the expense of its carriage and application are so high as often to forbid its use. On the above assumed data, there will only remain about 18*s.* sterling per acre to meet the carriage and spreading of the manure. The expense of labour is strikingly exhibited in contrast with the value of the crop—the wages of a labourer may be stated at 3*s.* 1*d.* per day, and the value of an acre of Wheat would employ a man about 32 days. The difficulty of transporting certain kinds of Grass produce from a distance, such as hay and fresh dairy produce, keeps up the price of these commodities.

It is possible to purchase exhausted sandy soil, Cotton and Tobacco lands, in Virginia, near to Petersburgh and to good markets, at the price of 1*l.* per acre; but the difficulty will be something like this: money is worth 10 per cent., and it is doubtful whether an investment in Virginia lands can be made profitable; the most prudent course will be to calculate every expense in bringing the acre of land into cultivation.

	£	s	d
Acre, freehold, bought at	£1	0	0
Log hut per acre, cost	0	2	0
The land and its buildings	£1	2	0
1*l.* at 10 per cent. interest per annum	0	2	0
To be redeemed in 7½ years do.	0	3	3½
Life assurance (collateral security)	0	0	9

Returns, perhaps 30 bushels, at 2*s.*	3	0	0
	£0	0	3½

Your little capital of 250*l.* must realise 10 per cent., and your labour ought to be paid at least 50*l.* per annum—here will be a charge on a certain sized farm—75*l.* per annum. What system of farming will admit of a charge equal to 33 per cent.? Let us look to the market value of produce, and the price of labour. Wheat, 3*s.* 6*d.*; flour, 286 lbs., 17*s.* 6*d.*, equal to 5 bushels of Wheat; Maize, 1*s.* 10*d.*; Barley, 1*s.* 10*d.*; Oats, 1*s.*; hay, 6*d.* per stone; Buckwheat, 1*s.* 10*d.*; Rye, 1*s.* 10*d.*; Parsnips, 4*d.* per bushel; Carrots, 5*d.* per cwt. [?]; Beans, 2*s.* per bushel; Turnips, 1*s.*; Beets, 2*s.* per cwt.; Mangold Wurzel, 2*s.* per cwt.; Cabbages, 1*l.* per ton; Pumpkins, 10*s.* per ton; Prickley Comfrey, Millet, Artichokes, Chicory, Potatoes, 1*s.* 3*d.* Root of Plenty: Banana yields the greatest proportion of aliment with the least culture—the amount of nutritive substance yielded by it is to that of Wheat as 133 to 1, and to that of Potatoes 44 to 1. Ground Nuts, famous feed for cattle; Clover, Italian Rye-grass, Timothy Blue Grass, Herds Grass, Bermuda Grass, Ruta Baga, Kohl Rabi, Peas, Tares. Beef, veal, mutton, pork, average 2½*d.* per lb.; bacon and ham, 3*d.*; fowls and ducks, 1*s.* each; chickens and pigeons, 4*d.* each; geese, 2*s.*; turkey, 3*s.*; eggs, 6*d.* per dozen; milk, 3*d.* per quart; butter, 6*d.* per lb.; carts, 8*l.*; ploughs, 3*l.*; double harness, 4*l.*; log chains, 6*d.* per lb.; scythe and snath, 6*s.*; rakes, 10*d.*; pitchforks, 3*s.*; shovels and spades, 4*s.*; axes, 6*s.*; hoes, 3*s.*; and as iron work is very dear, all other farming utensils are considerably dearer than in England. Persons employed on a farm get board, lodging, and their washing, and about 3*s.* per day; gardeners, 4*s.* per day; cutting hay, per acre, 6*s.*; threshing with the flail—Barley, 2*d.*; Oats, 2*d.*; Rye, 8*d.*; Wheat, 6*d.* per bushel; workmen assisting at farm work get 50*s.* per month with maintenance. Landlords in Virginia will furnish stock and implements to cultivate the soil on receiving half of the produce when sold. There is a considerable loss of time, and a great expense, in sending produce to market, and English farmers in America must make up their minds to pay double wages to good servants, and to receive for crops at least 33 per cent. less than the London prices. It is a difficult task to purchase good land, near to a good market, at such a price as will admit of skilful cultivation, money being borrowed at 10 per cent. for the term of seven and a half years. Property secured by fire and life assurance and other collateral security. Farm horse, 20*l.*; cow, 3*l.*; calf, 10*s.*; hog, 12*s.*; sheep, 6*s.*; beef, mutton, veal, pork, bacon, ham, lard, butter, cheese, eggs, milk, poultry, and all manner of produce, 50 per cent. less than in the London market. The average of crops are, Wheat 20 bushels, Oats 30, Indian corn 30 per acre. Wages are so high, say 3*s.* to 4*s.* a day, that a farmer must not lavish capital on fanciful improvements, or employ much labour on finical operations. The farmer must calculate the value of every day's labour. Farming cannot be pursued on a large scale with a prospect of success, as a great many of the workmen are idle and unsteady, and there is a difficulty of superintending the operation and forming a proper division of labour with unskilful and untractable workmen. There is, however, an excellent field for prudent skill and industry near to all manufacturing towns, approached by railroad, canal, and river. Science seems scarcely to have been thought of in American farming, and a cautious application of it in draining and other improvements, in particular situations, would be remunerating. The small farms, fairly cultivated, pay the best. The value of farm produce and land in different sections of the country will be affected in opposite ways by the opening of the communication between the east and the west. By lessening the expense of transport, a greater produce will flow from the west to the east, and there will be less difference in price, either by produce falling in the east or rising in the west. If prices fall in the east, the value of land will fall there, and if prices rise in the west the value of land will increase there. Facilitating the intercourse between the countries will extend the market for western produce and operate like an influx of inhabitants, and the natural effects will be a rise in the value of produce and land in that quarter.

We will now draw another comparison between these opposite localities. In the west, land is bought for 10*s.* an acre, and the produce we will say is Indian corn, valued on the farm at 50*s.*, being 1*s.* per bushel. In the east, land is bought at 1*l.*, and we will have as a crop 25 bushels of Indian corn, at 2*s.* per bushel, near to market; but the land requires manure and better cultivation, and a large outlay, agriculture being little known as a science in any part of America, and but imperfectly understood as an art; the same diversity of opinion and modes of management prevails as in Britain, with greater difficulty of becoming acquainted with them. The following particulars relate to the neighbourhood of the city of New York.

Grass crops are mown for hay five or six years in succession, without being top-dressed or manured in any way; the aftermath, which is seldom abundant, being depastured. Five pounds of red Clover and half a peck of Timothy seeds, Phleum pratense, are sown on an acre, and also occasionally small quantities of Herd-grass and Red-top, two kinds of Poa. I believe the red Clover lives longer than it commonly does in the cultivated fields of Britain, having seen many plants after five successive crops of hay. The Grass on being ploughed is followed in the 1st year by Indian Corn, without manure—by Potatoes, with manure, in the second year—and if early they are followed by Buckwheat. Barley is taken in the third year; and in the fourth, Oats accompanied with Grass seeds. Potatoes are grown in drills, as in Britain, and sometimes in hills 3 or 4 feet distant, formed by the surface being marked into squares by the plough; a whole Potato or three cuttings are placed above manure, and both covered over with the spade. The fruit crop is often injured by spring frosts (April), and Wheat by mildew (rust), it is liable to be killed in winter by heaving, the Hessian fly, and army worm. The best crops are spring Wheat, Buckwheat, Rye, Oats, Barley, Turnips, Peas, Grass, and garden vegetables. Cattle and sheep are fed on Indian Corn, Ruta Baga, Hay, Grains, crushed Oats, and Barley. The prices of farm horses are, 15*l.*; oxen, 5*l.*; cows, 5*l.*; calves, 1*l.*; hogs, 12*s.*; sheep, 6*s.* to 12*s.*; turkeys, 3*s.*; geese, 2*s.*; ducks, 1*s.*; fowls, 1*s.*; chickens, 6*d.*; pigeons, 4*d.*; rabbits, 6*d.*; eggs, 6*d.* a dozen; milk, 3*d.*; cheese, 3*d.*; butter, 6*d.*; hams, 4*d.*; bacon, 4*d.*; beef, 2*d.*; pork, 2*d.*; veal, 2*d.*; mutton, 2*d.*; flour, 186 lbs., 17*s.* 6*d.*; lard, 3*d.*; candles, 3*d.*; tea, 2*s.*; coffee, 10*d.*; beer, 1*s.* per gallon; spirits and wines, 50 per cent. less English price; house rent full 25 per cent dearer; labourers, 3*s.* to 4*s.* per day; hire of plough and two horses, to work an acre of land, 10*s.*; house servants, 2*l.* to 3*l.* per month; gardeners, 4*s.* per day; garden seeds generally very bad; American iron ploughs, 4*l.* to 6*l.*; wagons, 10*l.*; double harness, 4*l.*; log chains, 6*d.* per lb.; scythe and snath, 8*s.*; rakes, 10*d.*; brooms, 10*d.*; pitchforks, 3*s.*; shovels and spades, 5*s.* to 6*s.*; axes, 8*s.*; hoes, 3*s.*; Wheat, 3*s.* 6*d.*; Indian Corn, 2*s.*; Buckwheat, Barley, Rye, 1*s.* 6*d.* to 2*s.*; hay, 4*l.* per ton. Swede Turnips are sown in August and stored before winter. Geese are plucked three times a year, live goose feathers being a general article of commerce. Farm labourers away from New York (150 miles), get 50*s.* a month, with bed and board, including washing; and a deduction is made for sickness or voluntary absence. A married man is allowed double wages to board and lodge himself apart from the family, and pays the landlord 5*l.* per annum for cottage and garden. The hours of labour are from sunrise to sunset, without any specified time for meals, to which they are commonly summoned by sound of horn. Hired men do not consider themselves bound for any length of time, and occasionally absent themselves for a day or two, without giving notice of their intention. Hired spade men get 3*s.* a day, without board, all the year round. Threshing machines are common, but not good; and when the flail is used, Barley and Oats cost 1½*d.*; Rye, 3½*d.*; Wheat, 6½*d.* per bushel, and then require to be fed. From the high price of human labour, compared with the price of food, Indian Corn is often trodden out by oxen. Craddlers generally mow round the field when the crop admits of doing so. Hay costs in cutting from 5*s.* to 6*s.* an acre; sometimes labourers can be found who will craddle an acre of Rye at a charge of 3*s.* per acre. In the neighbourhood of Philadelphia, land of fine quality, and in high condition, may be had from 20*l.* to 25*l.* with the tenements, per acre. Produce of all descriptions is high, and the straw of a Wheat crop sold at 6*l.* per acre. Wheat is often mildewed. Mr. A. grows excellent Swede Turnips after his Wheat crop, and this is the only succession of crops he gets in one year; he ploughs in green vegetable matter, such as Clover aftermath, French Beans, Lupins, and Indian Corn, for manure to other crops. Horses and cattle are soiled with green food in summer. Sheep are generally a mixture of Leicester and Cotswold breeds, the pure blood of the former not being found to answer; the flock was miserably low in condition, and the ewes were followed by large and not fat-looking lambs. Smaller and more hardy breeds of cattle and sheep are found to answer best (Devons). Pastures suffer from want of drainage and top dressing. Hay is the best paying article of farm produce, which induces the farmer to mow their Grass lands when first sown down, year after year, so long as the herbage can be collected with the scythe, after which it is converted into pasturage. Mr. Buel's farm consists of inferior sand, and extremely wet, though capable of being drained. Notwithstanding these disadvantages, some good crops were seen, more especially Indian Corn and Swede Turnips, the latter sown after a hay crop, with bone manure. Another farmer on clay lands sows Clover among Wheat, which affords good pasturage during autumn, and is fed off in the following spring; the land is ploughed in the end of June, and after an imperfect fallowing, sown with Wheat in autumn. The Dutch farmers also sow Clover with the Wheat crop, which in spring is ploughed down for manure without being fed off. This shows how much Nature does for the farmer, one year providing manure, and the next a Wheat crop. Skill might improve the system followed; but the period of introducing improved agriculture into the United States (1840) has not arrived. (Read "A Tour through North America," by Patrick Sherriff, farmer, Mungoswells, East Lothian, published by Simpkin, Marshall, and Co., London.) This gentleman was ap-

pointed by a party of East Lothian farmers, to visit and report on the Canadas and the United States; and his younger brother having expressed a wish to try his fortune as an American farmer, Mr. Sherriff resolved to explore the country for thousands of miles, for the purpose of enabling him to give an opinion on the step which his brother contemplated. Dutch farmers in the state of New York apply 50 heaped Winchester bushels of lime to an acre; gypsum costs 7*d.* per bushel, and is only used for Clover and Indian Corn; people carry it in baskets, and put a pinch on each hill, or cluster of plants, half a bushel is sufficient for an acre. Labourers are found their victuals and paid 4*s.* a day for cutting an acre of Wheat with the craddle scythe, and two bonders follow the craddler at 2*s.* 10*d.* each. Sheep, a mixture of Saxon and merino blood, are kept in courts during winter, fed on hay, and lamb between the 20th of April and the 20th of May. The lambs, starvelings when compared with those of England; the price of ewes, when lambs are weaned, is 12*s.*, and that of two years old wedders, 8*s.* to 10*s.* Fleeces weigh 3½ lbs., worth 2*s.* per lb. *T. W.*

ON THE VARIETIES OF THE OAT.

The Oat may emphatically be called the staple agricultural product of Scotland—a country admittedly the best fitted for its growth, and hence the importance of it comparatively with the other cereals. No soil in this country is found either too rich or too poor, too hot or too cold for it; within the range of the altitude for the cereals, the most tenacious clays, meagre gravels, or other light lands, moss or bog, when sufficiently drained, will all produce fair crops of one variety or another, if the tillage be properly attended to, and the seed judiciously sown and covered. In the gradations from rich to poor soils, in upland and lowland districts, a corresponding change of variety is, doubtless, rendered necessary; but a long series of experiments, conducted by shrewd men in every district of Scotland, has so nicely adjusted the distribution of these varieties, according to the nature of the soil and other circumstances, that, except in the way of improvement, little remains to be effected. It will be therefore my object—1st, to enumerate the districts of Scotland, and the varieties of Oats cultivated therein; and, 2d, to consider, with regard to these districts, how far these varieties may be profitably changed, or other kinds introduced. I may, in the first place, mention that the varieties of Oats at present known are about 60. Some confusion exists in the identity of many of them, from the close approximation to each other in external appearance, as also from the use of synonyms. Of this number, judging from the experience there has been of them, about one-half may be readily dispensed with in this country, being of trifling importance even as forage plants. About 30 distinct varieties are, however, grown in Scotland, but about a dozen only are in general cultivation. The remainder of these 30, comprising many valuable kinds, are at present confined to small localities. The following list includes the 12 varieties alluded to:—Potato, Hopetoun, Sandy, Early Angus, Late Angus, Grey Angus, Blainslie, Berlie, Dun, Friesland, Black Tartarian, and Barbachlaw. These are so well known that any descriptive account of them is quite unnecessary. I have classed them in the order of their general cultivation throughout Scotland; the same arrangement applying nearly to the order of their economical value, as well as their fitness for soil and situation, in regard to shelter, ranging from the best to the worst. To render the distinction of varieties somewhat more intelligible, I have proposed a synoptical table, on reference to which these varieties will be found classed according to their adaptation: 1st. To the best soils and sheltered situations; 2d. To intermediate soils and situations; 3d. To high altitudes and exposed situations:

Synoptical Table of the varieties of Oats cultivated in Scotland, classed according to their adaptation.

1st. To the best soils and sheltered situations.

1. Potato.

Hopetoun	Early Angus
Flemish	Cupar Grange.

2d. To the intermediate soils and situations.

2. Sandy.

Dyock	Drummond
Berlie	Dun
Red Mackbiehill	Sheriff
Blainslie	Cumberland Early
Grey Angus	Cleland
Late Angus	Siberian
Poland	Georgian
Friesland	Blue Major
Lancashire Witches	Church's.
Tam Finlay	

3d. To high altitudes and exposed situations.

Kildrummie	Barbachlaw
Strathallan	Black Murkle
Black Tartarian	Bristle Pointed.
Old Black	

In enumerating the different districts, and the varieties cultivated therein, I shall commence with Orkney and Zetland. In these isles, in the better and more sheltered districts, the Sandy, Angus, and Hopetoun are successfully cultivated. In a few sheltered localities of the mainland of Orkney, Potato Oats are grown. In what may be termed secondary localities, the Black Murkle Oat (Avena fatua, or wild Oat), and the Black Tartarian (Avena orientalis), are grown, while in the upland and most exposed districts, the common Bristle-poiuted Oat (Avena strigosa), the Danthronia strigosa of modern botanists is cultivated, from a conviction that no other kind will thrive in so exposed a locality. This sort, I may incidentally mention, is cultivated in some parts of France as forage. It is quite distinct from the Avena brevis, or Short Oat of that country, although there is a close resemblance in the grain, and it is considered by some to have been the original cultivated Oat of Scotland.

Caithness.—In this county, a district peculiarly fitted for the growth of the Oat, the whole of the sorts previously enumerated are grown, and, with the exception of the late Angus, Berlie, Friesland, and Barbachlaw, are well-known throughout the whole country. The variety called Black Murkle, the common wild Oat (Avena fatua), highly improved, is cultivated in many secondary localities. It is readily distinguished from all other dark coloured cultivated Oats, by the presence of a tuft of hair at the base of the grain, which is the principal characteristic of the species. Various trials have been, and are still occasionally made, of other kinds. The Potato, Hopetoun, Sandy and Dun, however continue the favourites.

Sutherland.—This may be considered more a Barley district, the Oat being comparatively of minor consideration. The Potato, Hopetoun, and Sandy are the principal varieties; while the Angus and Dun are cultivated to a limited extent only.

Ross, Cromarty, and Inverness.—These three counties may be divided into upper and lower districts. In the former we find the Wild Oat, the Black Tartarian, and the Barbachlaw (under the name of the Common White Oat), occupying the poorer soils, the Early Angus and the Sandy the intermediate; while in the lower district, the Angus, Sandy, Hopetoun, and Potato, are generally grown. The Black Tartarian is also grown to a considerable extent even in the lower district, especially on improved peat soils.

Argyle.—The whole of the 12 kinds previously named are cultivated here, but the Potato to a more limited extent than in the neighbouring counties—the Friesland, and varieties under the names of Poland and Flemish, taking its place. The Flemish is a hardy, free-growing sort, with long straw; grain fully equal to the Friesland, and ripens somewhat earlier. The Poland in grain resembles an inferior sample of Potato, and in other respects is similar to it. In these northern counties the White Siberian Oat, brought from Russia about a dozen years ago, has been introduced, but does not appear to have made much progress in the estimation of the farmers. It belongs to the class known under the name of Georgian, remarkable for its earliness, ripening fully a fortnight sooner than the Potato. Its weight of grain is frequently 46 lbs. per bushel, although the skin is as thick as the Old Georgian. As a proof of its earliness, in comparison with the Potato, I may mention, that, many years ago, my friend, Mr. George Watson, at Liberton Mains, who first grew it for me here, had it sown at the same time as Potato Oats, and he nearly lost the whole, from the grain having fallen out before the Potato had lost their green colour.

Nairn, Banff, and Moray.—The common Wild Oat was formerly cultivated in the higher districts of these counties; but the progressive development of the resources of the soil, and the introduction of improved varieties, has led gradually to its relinquishment, and now all the 12 varieties are grown; but the Potato, Hopetoun, Sandy, Angus, and Berlie, form the staple. In some districts the variety known under the name of Kildrummie is a favourite; it is an early, long-strawed excellent sort for high districts.

Aberdeen.—This county, from its extent, presents a great variety of soil and exposure, and consequent diversity of circumstance relative to the adaptation of varieties; and we find the whole of the kinds originally enumerated in very general cultivation. The Sandy generally takes the lead, and is known in some localities of the county under the name of the Rhynie Oat, having been originally discovered in 1824, on a farm in that parish.

Kincardine and Forfar.—Here we find the Hopetoun, Sandy, and Angus, in general cultivation, while a considerable breadth is occupied by the Potato. In some districts, and especially about Brechin, a variety known as the Dyock, and in some places as Davidson's Oat, is much esteemed, being considered earlier, and even more prolific than the Sandy. It is, however, more liable to shake, and should be cut before being fully ripe. A very excellent variety, both for meal and straw, known by the name of the Cupar Grange Oat, is cultivated in some of the best localities in these counties. It has large grain, generally well filled, moderately thin skin; but late in ripening.

Perthshire, Stirling, Clackmannan, Kinross, Fife, Dumbarton, and Bute.—This extensive district of country presents a wide field for the favourable growth of all the known varieties; and we consequently find that not only are the 12 enumerated kinds generally cultivated, but many others, though confined, perhaps, to limited localities, are also grown. Of these additional kinds, I shall mention two much estmeemed, viz., the Drummond Oat and the Strathallan Oat; the former well adapted for strong clay soils, the grain of a reddish colour, and ripening about a week later than the Potato; the latter extensively cultivated in the higher parts of Strathearn and west of Perthshire, where it is also known under the name of the Irish Oat, but supposed to be a corruption of earish, of earlyish, or from its early ripening property. It is even calculated to withstand rough, windy, and wet weather, but its culture is only advisable in exposed and late situations. The Black Tartarian is profitably grown in some of the higher districts. The Naked Oat (Avena nuda), formerly cultivated to a limited extent, appears now to be altogether abandoned.

Ayrshire.—The Hopetoun, Sandy, and Angus, take the lead in this county, although the rest of the 12 enumerated varieties are also grown. In some localities a variety, known under the name of the Tam Finlay Oat, is much esteemed by cultivators. It was formerly known as the old Poland Oat, is hardy, ripens about a week later than the Potato, and yields particularly well in straw, and also in meal, in proportion to its weight. Is apparently well adapted to several localities in this country; but it is a circumstance worth noticing, that although tried in other parts of the kingdom in similar soils, the yield has not equalled that obtained in Ayrshire.

Lanark and Renfrew.—All the enumerated varieties are grown, but the Blainslie fully to a greater extent than in the neighbouring counties; and in some localities a variety, under the name of the Cleland Oat, is deservedly appreciated, from its hardy and prolific nature, and being one of the earliest sorts in existence.

Lothians.—In the lower districts we find the Potato and the Hopetoun most generally cultivated, while the Sandy is extending, to the exclusion of sorts for which the locality was found by experience not to be so well adapted. All the other enumerated kinds are grown in fair proportion, while, in the late and colder districts we find occasionally, with the Friesland, Black Tartarian, and Barbachlaw, the old common black Oat, a distinct variety of the Avena sativa, with spreading panicles; a very prolific, early sort, not easily shaken by wind. In some parts of East Lothian an early variety, resembling the Hopetoun in the red spot in the bosom, and known under the name of the Sheriff Oat, is also met with. In the neighbourhood of Edinburgh, the leading sorts are Potato, Hopetoun, Sandy, Angus, Berlie, and Blainslie; and although the other varieties may be productive in other localities, they have not been found more profitable by the farmers who have grown them for us. Besides, most of the varieties cultivated throughout Scotland, we have also had occasionally grown in this neighbourhood the following, viz.: the Danish, a hardy yellowish Oat; the Early Essex, an early prolific long grained sort; the Black Riga or Archangel; the Georgian, the white Tartarian, the Early Tuscany, the Winter Dun, and the French Potato. They have not been found, however, by the farmer so profitable as the sorts in general cultivation; and when we have them grown in this neighbourhood for seed, we have always been obliged to pay for them at the rate of the market price of Potato Oats.

Berwick and Roxburgh.—The Potato and the Hopetoun are the varieties in general cultivation, the remainder of the enumerated kinds being grown to a limited extent. An early prolific variety, under the name of the Red Kent, is grown successfully in some parts; and in Lauderdale the Blue Major, a variety allied to the old Georgian, is occasionally met with. The Cumberland Early, one of the earliest varieties in existence, and the Lancashire Witches, also an early sort, and superior both in straw and grain, are cultivated towards the border.

Selkirk and Peebles.—The Sandy is now extensively grown in these counties; but the Hopetoun and Angus are also pretty general. A hardy, prolific variety, known under the name of the Red Macbie Hill Oat, used to be much esteemed, and continues a favourite in some districts.

Dumfries, Kircudbright, and Wigton.—Besides the enumerated varieties, the first six more especially, there is one occasionally met with under the name of Church's or Churick's Oat. It is a large-grained, thick-skinned sort, evidently allied to, if not the same, as the Georgian, and quite distinct from the variety described under the name of Church's, in the Society's Transactions, published in 1816. I have now enumerated all the varieties grown in the different districts of this country; and, in the cursory remarks I made upon their characteristic qualities, and adaptability to soil and situation, I am glad to find they agree with the observations of the gentlemen who have preceded me; and borne out also, to some extent, by Mr. John Mitchell, Wester Alves, and Mr. James Melvin, Bonnington, two experienced farmers, whose experiments on the comparative earliness, productiveness, and profit in grain and straw of different cultivated varieties of Oats, are published in the last number but one of the Society's Transactions. This, I think, exhausts the first part of the subject. There are, doubtless, other varieties grown than those I have mentioned, but their cultivation is simply experimental, and limited to those scientific farmers, the result of whose experiments I may be permitted to say, all are anxious to avail themselves of, but which few care about instituting for themselves. I now come to the second head, viz., to consider how far the varieties presently cultivated in the several localities, may be profitably changed or supplemented. I have before stated that the soil and climate of Scotland is peculiarly adapted to the production of Oats in perfection; consequently, until we arrive at excellence, the field is open to improvement, and our progress must be in the ratio of our success in establishing those varieties in which are combined the most profitable qualities compatible with fitness for the given localities. Now, in order to arrive at this, we have first to consider the capability of the situation for the production of the most profitable combination of qualities, a correct knowledge of which can only be obtained by much care, attention, and frequently repeated trials. These qualities may be thus enumerated: Quantity and quality of grain, quality and bulk of straw, early ripening, power of resistance to wind and water, &c., adaptation

to the exposure and altitude of different soils, and freedom from disease.

Having possessed ourselves of this knowledge, we have next to ascertain whether there is a variety known combining the requisite qualities in the desired degree. If such a variety is not to be found, we must proceed to obtain one, either by the improvement of an old variety, or, by cross-impregnation, to generate a new one.

This course must be followed in order to reach the point in view—a result certainly within our power, although only to be arrived at after a second course of carefully conducted experiments. The quantity and quality of grain, even of the Potato Oat, may be advanced nearer perfection, by selecting the largest grains from the panicle, as the progenitor of an improved variety. Early ripening will be induced by selecting the earliest ripened grain from each panicle, and preserving it for seed. Quality and bulk of straw, hardiness and adaptation to locality, are also affected by selection; and the desired degree of any quality, which may not be obtained by this mode, cannot fail ultimately to be produced by hybridising those varieties approaching nearest to what is aimed at. This procedure will involve a long course of experiments extending necessarily over many years—experiments not confined to a single locality, but systematically carried out upon every description of soil and situation; indeed, to insure certain success upon every farm.

We must, therefore, in the meantime (while these experiments are in progress), make the most judicious application of the knowledge we at present possess, by selecting for particular localities those varieties already known to us, and are most likely from their properties to approach perfection. For example, in situations where the Black Murkle and Barbachlaw Oats are now grown, there is every probability that the Kildrummie, Strathallan, Cumberland Early, and Cleland would thrive; and even our Ayrshire Friend, Tam Finlay, might probably be profitably supplemented by the Cupar Grange or the Berlie, and in most localities a progressive improvement would certainly be made by a more judicious selection of the present varieties.

Agriculture is confessedly but yet in its infancy. Its exaltation to the class of sciences is comparatively recent. We should all, therefore, cheerfully lend a helping hand in solving the great problem which science has propounded—and by experiment alone can this be done. Experiments, as Von Thaer tells us, are not easy; still they are in the power of every thinking man. He who accomplishes but one, of however limited application, and takes care to report it faithfully, advances the science and consequently the practice of agriculture, and acquires thereby a right to the gratitude of his fellows, and of those who come after. *Mr. Lawson, at the late Monthly Meeting of the Highland Society.*

Home Correspondence.

Potato Disease.—Being a grower of nearly 150 acres of Potatoes myself, and having the partial superintendence and power of closely observing 200 acres more, I have had ample opportunity of testing the different plans propounded as cures for the disease; but, alas! all have proved unavailing. The "excess of top plan" produced by stimulants, and the "no top at all system" of Mr. Lomba were equally accompanied by disease. The only conclusion I have arrived at with anything like certainty is this—that early planting and preventing the access of moisture to the tuber until fully grown alone secure anything approaching to freedom from disease. In no instance have I known late planted crops free from an unusually large proportion of unsound tubers. So convinced am I of the fact that the first great step to a sound crop is early planting, that I had 100 acres planted a month back, and I have now 50 acres more in the ground. I would therefore advise all who would secure every chance of a sound crop, to get to work directly. In this one respect of early planting, the results of my experiments were invariable—the crops being worse and worse, just in proportion to the lateness of planting—the last piece finished in the end of April last year was not worth digging up. With respect to the after management of the crop, I find that too early moulding up the plants, before the tubers are sufficiently developed, much retards their growth, and tends to produce a second formation of tubers, which never attain their full size, nor do they ripen so early as the first developed ones. This was fully tested on a series of beds, planted on the Irish "lazy-bed" system, besides other similar experiments on a larger scale. By this lazy-bed system I conceived I should secure a greater dryness and warmth of soil for the roots to work in, the set being placed upon the surface of the land, and covered by the soil thrown out of the alleys between each bed; these alleys also acting as perfect drains to the beds. I commenced by planting large whole Potatoes, weighing from 1½ lbs. to 2lbs. each, gradually decreasing the size till the sets of the last bed were no larger than sparrow's eggs. The result showed, that beyond a certain point the ordinary rule did not obtain with Potatoes as with other seed—that the finer selected seed gave proportionably improved produce. For the produce of the largest sets degenerated most strikingly—down to a certain point about midway between the largest and smallest sets—the produce from the sets about the size of a hen's egg being by far the finest Potatoes. Whereas from this middle point, downwards to the smallest sized set, the produce, both in size of tubers and bulk of crop, was "small by degrees and beautifully less," till the lowest in the scale was but a caricature of a Potato crop in every way. The greatest yield was found to be in the two following instances: 1st. From whole sets the size of a hen's egg, not moulded up until the tubers were as large as the original set—when a slight moulding up was given—and another more deeply when the Potatoes were fully grown. This bed was found to be much superior to those on each side of it, one of which was not moulded up at all; and the other was moulded up when the shaws were 6 inches high, and again at 10 inches, and lastly at their full growth. The second instance of superiority was shown in the bed planted with sets weighing half a pound each, and put in rather over 12 inches deep. The produce of this bed was very fine in size, and showed fewer diseased tubers than any others. The whole of the beds had some few diseased tubers, but the crop altogether was singularly free from disease, as compared with the main crop on the farm. This I attribute much to the extreme dryness produced by the beds being raised above the surface of the soil, like Asparagus beds. The only striking and decided variation from the main result of the experiments, was in one instance in which I adopted the plan of laying down the shaws when the Potatoes were nearly ripe. It was, I believe, first suggested by Mr. Martin, of Muirhead, Liff, near Dundee, who propounded the idea in one of the Scotch papers, where I first saw it. I afterwards corresponded with Mr. Martin, and obtained from him some very intelligent and useful hints on the general management of the Potato. This plan of laying down the shaws has been so fully described before, that I need say no more of it now, except that it consists in laying down, with the plough or otherwise, the stems, all in one direction, and covering them up with earth nearly to the very tips. Those I treated in this way, carefully and thoroughly, certainly did not produce one single diseased tuber, the only instance in which this was the case. I therefore intend putting into practice this treatment much more extensively during the present season. All I will now urge on the Potato grower is to plant directly; use whole middle-sized sets; place the manure over the whole of the land, instead of immediately in contact with the set; and plant part of the crop, by way of experiment, at least 8 inches deep. I am inclined to believe that the last month of splendid weather has decided the fate of the coming Potato crop, if planted with due regard to all the above precautions, for the land is now so dry and warm that the plants will grow strongly and rapidly, and the crop attain, in all probability, to more than usually early maturity. *J. Fryer, jun., Isle of Ely.*

Steam Threshing Machine.—As Mr. Richard Nicklin, in a late number of the *Gazette*, gives the particulars of his threshing machine, with calculated velocities of the drum and rollers, so outrageously far from the truth, it may not be amiss to set him to rights on the subject. He states the drum to be 3 feet 3 inches in diameter, and to have made 290 revolutions per minute; and from thence deduces the velocity of the beaters to be more than 35,000 feet in the same time; and the rollers, 5 inches diameter, with 71 turns, to move at the rate of 1115 feet per minute; of these, and the calculation of the present rate of speed of the drum at 440 revolutions, the whole results are entirely wrong; in fact, Mr. Nicklin seems to have mistaken inches for feet, as his numbers are about 12 times more than the truth. I calculate the real velocities to be 3.25 feet $\times$ 3.1416 $\times$ 290 = 2960.9 feet, as the velocity of the beaters in the first statement; and that of the rollers 5 inches diameter, making 71 revolutions, at 5 inches $\times$ 3.1416 $\times$ 71 = 1115.26 inches = 92.93 feet. The present speed of the drum, at 440 revolutions, will be 3.25 feet $\times$ 3.1416 $\times$ 440 = 4492.48 feet, and that of the rollers at 110 revolutions at nearly 144 feet. I should not trouble you with these corrections; but from the tenor of Mr. Nicklin's communication, he seems to think his statement correct, although a moment's consideration would serve to convince that such velocities as 30,000 to 50,000 feet per minute are perfectly unattainable in threshing machines. As Mr. Nicklin's rollers require so great an expenditure of power to drive them (probably one-sixth of the whole), he will find it worth his while to discard them altogether; but, in this case, the feed should be near the summit of the drum, and he will find the machine thresh equally clean. I think the cleanness of the work depends chiefly on the velocity of the beaters, and the position of the breast. Mr. Nicklin's machine, making 440 revolutions per minute, will be effectual, and it is undesirable to go much faster, as too great speed renders the machine liable to break and damage the grain. *Lusor.* [The whole error arises from the word feet having been accidentally used in place of inches.]

Storing Turnips.—In my letter on this subject in your Paper of March 9, I find I have omitted to state the expense of the operation of preserving a crop by ploughing in. At the time when my experiment was made labour was very much higher than it is now; but even then, I reckoned the total cost of securing a crop at only 5*s.* an acre. Now, of course it would be much less; say, at most, 4*s.* an acre: and what is this compared with the advantage of the system? Pray may I ask what particular object you have in changing my friend *Blaikie*'s name to *Blackie*? An acquaintance of some 35 years ought surely to be some warranty for the correctness of the name of a friend. *Samuel Taylor.*

Roots per acre.—The words of the Farmer's Almanack are, "plant out Cabbages on land dressed and ridged as for Swedes, putting the plants 3 feet apart." Now the usual distance of ridges for Swedes is 2 feet; an acre, therefore, thus planted, would contain 33 rows, each having 220 plants, or 7360 Cabbages *i. e.* about 7400. Consequently the almanack is not in error. *Sigma.*

Cattle Insurance Company.—Your correspondent "M. Y." asks if all the members of the Farmers and Graziers' Cattle Insurance Company are liable to the demand made upon them of 30*s.* to make up the alleged insufficiency of their funds to pay the losses. I think certainly not; for there is a clause in all their policies which says, "But the premiums of the Association shall alone be answerable for such payment (*i. e.* losses), and no director nor any party effecting an insurance in the said association, the premiums thereon having been duly paid, shall be individually responsible for the payment of a contribution towards such losses, or be liable to any demand against the association, on any pretence whatever, beyond the premiums of the association." When on a similar demand being made upon me I drew the attention of the manager to this clause, his reply was that this demand was not to be considered as a contribution, but as the premium upon the insurance, which, in the first instance, had been taken too low. This is very poor reasoning; but admitting it to be correct, it follows that each member should have been called upon for a *pro rata* contribution, according to his original premium, whether 10 or 50 per cent., instead of demanding 30*s.* from the insurer of a cow and a like sum from the insurer of a large herd. But if, as you say, there are large insurers who have not been so called upon, then I can only characterise the proceeding as unjust and dishonest. I drew the attention of his Grace the Duke of Richmond to this matter some months since, and have no doubt that he has, as a patron of the Society, looked into it, and that a more just course will in future be pursued; but I much fear the Society is destroyed by the system adopted, which is much to be regretted, as it was calculated to be of great general utility, if honestly and fairly worked. *W. H. L.* [Our remark had reference to the Agriculturist Mutual Company for the Insurance of Cattle, &c.]

Acidity in Beer.—It is the common practice to tun the beer the next day after brewing, and let it ferment in the cask in which it is kept. Now, although a large quantity of yeast is forced out, a very great quantity remains in the cask, notwithstanding its being filled up; this yeast settles at the bottom of the cask, and gives the beer an unpleasant bitter taste; besides, it makes it thick and unwholesome. Now, yeast being a fermenting principle, it only requires a slight rise in the temperature to bring it into action; and if within the influence of atmospheric changes, is certain to be roused to activity, sending up small bubbles of air, and at last turns the whole to vinegar; and beer with such an active agent in it as yeast must be unwholesome; when taken into the human stomach it is placed at once in a temperature favourable to its action, thus accounting for flatulence and acidity. Now, instead of tunning the beer the next day after brewing, it should be allowed to remain in a large tub or vat until the fermentation is complete, when all the yeast that rises to the surface should be skimmed off, but the greater part will settle at the bottom, the tub or vat being raised a foot above the ground, to allow the beer to be drawn carefully off, without disturbing the sediment; it should then be put into the cask, with a few new Hops, which will gradually yield the bitter principle as it is required. The beer cannot be tunned too fine and free from yeast. It may be bunged down in a day or two after tunning. I may observe that the highest medical testimony is given in favour of the ales brewed expressly for hot climates; these also owe their superior anti-acid and wholesome qualities to their complete fermentation, and consequent freedom from anything calculated to excite a second fermentation. *B.*

Hybrid between Pheasant and Domestic Fowl.—Lately many articles have appeared in your Paper on this subject, many of which I have read. From my observation, I should say such an occurence (if it ever happened at all), is extremely rare. In the first place the progeny of such cross would be very remarkable looking creatures, partaking equally of each species, not having the head or tail of either, but resembling one as much as the other; so it is with the hybrid between the capercail and black grouse, so in the hybrid between the pheasant and black grouse (two of which are in the Newcastle Museum), so in the hybrid between the pintail and common wild ducks, so in the hybrid between the wigeon and pintail duck, all of which have occurred in a wild state in England. I should remark that all the hybrids of the gallinaceous birds I have seen are males. Many persons ridiculously suppose that what are commonly called pheasant hens, and which have black tipped feathers on the breast, resembling those on the breast of a cock pheasant, have a cross of the pheasant in them; now this supposition is absurd, because the cock bird only would resemble the cock pheasant, and the hen birds would resemble the hen pheasant, which has no such marks. The improbability of such hybrids ever being produced is demonstrated by hybrids not occurring frequently under the most favourable circumstances, where both bantams and common fowls stray where they please into woods and plantations full of pheasants. Probably if either a cock pheasant and domestic hen, or a domestic cock and hen pheasant are confined together, eggs would be layed, which if they could be hatched would produce hybrids, but any further than merely trying such an experiment for curiosity sake, cannot answer any good purpose; for even if such hybrids were brought to maturity, it is highly improba-

ble that they would be capable of reproducing, and if they were so we should run the chance of losing the original species of pheasant altogether, and get a clumsy mongrel in its place. It really does seem a pity to waste either time or expense in trying to make hybrids. Improve breeds of animals of the same species as much as possible, but why try to do what Nature does not approve, the mixing of species. Luckily Nature has defined certain bounds, beyond which all man's projections and imaginations cannot exceed. *C., Newcastle.*

Garden Farm.—As the son of a clergyman interested in farming, but as yet not very deeply versed either in its science or practice, I venture to offer a few suggestions to "A Country Curate" (an enquiring correspondent in a late Number), as to the cultivation of his garden farm. It may appear presumptuous that one confessedly a learner should make such an attempt, especially as your correspondent has already the advantage of a companionship with "Paxton," and is I imagine, after all, not so much of a novice himself, as his letter at first sight might lead one to suppose. If my communication is not so "full" as he expects, I trust at all events he will give me credit for "promptness" in according with his request. We will suppose the quantity of land to amount to 3 roods or 120 poles, and to be cropped as in the following table, and I calculate the money value to be, as also therein stated. My estimate both as to quantities and price are moderate, as I wished rather to keep within the range of probabilities than possibilities. I think there will be no question as to these results being obtained any season, and of course there will be several successions, such as Stone Turnips after Peas, &c., which increases the value.

Poles.	Crops.	Estimated yield.	Market value.
20	Beans	4 bushels	£0 14 0
10	Peas	2 „	0 7 0
20	Barley	5 „	0 15 0
20	Potatoes	30 „	3 0 0
10	Cabbages	30 cwt.	0 15 0
20	Carrots	2 tons	2 10 0
20	Mangold Wurzel	2 „	0 15 0
			£8 16 0

The important question then is, how to consume the produce most profitably at home, as the markets near home appear to be well supplied. Several plans might be suggested, but bearing in view the cottager (and his allotment) who will be looking on, I propose to invest money only in pigs. (I shall add a small sum for poultry, which I suppose to be supplied in part from the produce of the farm.) I recommend, then, that about July, according to the market, 6 store pigs are purchased, at from 20*s.* to 30*s.* each, say the average 25*s.*; these will be supplied with the thinnings and leaves of the vegetable crops, with a little whole corn (Peas), till the beginning of October, when the Potatoes, Carrots, and Mangold Wurzel will be lifted, the corn having been previously housed; the animals at this period will be put upon a more forcing diet, say steamed roots and meal, and by Christmas my calculation of their value is as follows:

6 pigs, 8 score each, 7*s.* 6*d.*	£18	0 0
Cost price 7*l.* 10*s.* 0*d.*	8	10 0
Seeds, &c. 1 0 0		
	£9	10 0
Market value of produce	8	16 0
	£0	14 0

Besides most valuable manure for succeeding crops, with 10*s.* worth of tail corn for poultry. *T. P. H.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Monthly Council was held at the Society's House in Hanover-square, on Wednesday last, the 3d of April: present, the Marquis of Downshire, President, in the Chair; Colonel Austen, Mr. Raymond Barker, Mr. Blanshard, Mr. Bramston, M.P., Mr. Brandreth, Mr. French Burke, Colonel Challoner, Mr. Garrett, Mr. Brandreth Gibbs, Mr. Fisher Hobbs, Mr. Jonas, Mr. Milward, Mr. Pusey, M.P., Professor Sewell, Mr. Shaw, of London, Mr. Simpson, Mr. Jonas Webb, and Mr. Wibraham.

The following new members were elected:

Franklin, Thomas, Poltimore, Exeter
Praed, Wm. Mackworth, Delamore, Ivy-bridge, Devon
Hallett, Frederick Francis, Sussex-square, Brighton
Hole, William, The Park, Chudleigh, Devon
Middleton, Charles, Branthill, Holkham, Norfolk
Oliver, James, Hulton Park, Lancaster
Blackburn, Rev. Thomas, Clothall Rectory, Baldock, Herts
Du Châtelet, M. Le Roux, Reux, near Arras, Normandy
Dixon, J. Thomas, Dunterley, Bellingham, Northumberland
Girardot, Rev. J. Chancourt, Car-Colston Vicarage, Bingham, Notts

Finances.—Colonel Challoner, Chairman of the Finance Committee, presented to the Council the Report of the Committee on the accounts of the Society, from which it appeared that, at the end of the previous month, the current cash-balance in the hands of the Society's Bankers was 2285*l.* He explained that this general balance included 1260*l.* on the Exeter subscription account, and 110*l.* as the amount of life compositions to be invested, leaving 915*l.* as the balance available for current purposes. The Report stated that agreeably with the order of Council, proceedings were about to commence in the County Courts for the recovery of the arrears of subscription remaining still unpaid, and the Committee hoped to be able to report at the next meeting of the Council the full particulars connected with the legal decisions about to be obtained in each of the courts of law where the first actions were about to be brought. Colonel Challoner then entered into a detailed statement of the financial condition of the Society, and concluded by congratulating the Council on the healthy and flourishing condition of the Society: all debts had been paid, a large current cash-balance was in hand, and a considerable addition had been made to the invested capital in the public funds. — The Report of the Committee was adopted and confirmed.

Exeter Meeting.—Mr. Raymond Barker (in the absence of Lord Portman) presented the Report of the General Exeter Committee, in which was detailed the progress made in the preparations for the ensuing Country Meeting of the Society, to be held in that city in the middle of July next, in reference to the plan and erection of the Show-yards and Dining Pavilion, the transit of implements and live stock by railway, the inspection and explanation of the water-meadows in Devonshire, the exhibition of South Hams cattle for the prizes of the South Devon Association, and the insertion of the name of Mr. John Gould, of Poltimore, in the list of the General Exeter Committee to fill the vacancy occasioned by the decease of Mr. Stafford Northcote.—This report was adopted and confirmed by the Council.

Country Meeting Districts.—On the motion of Mr. Raymond Barker, seconded by Col. Challoner, the Council rescinded their resolution of May 5, 1847, by which the South-Eastern counties of England constituted the district for the Country Meeting in 1851; and then proceeded to decide that the county of Middlesex should comprise the metropolitan district for that year; the counties of Kent, Surrey, and Sussex the south-eastern district for 1852; the whole of South Wales, with the addition of the counties of Monmouth, Gloucester, Hereford, and Worcester, the South Wales district for 1853; and the counties of Leicester, Lincoln, Nottingham, and Rutland, the East Midland district for 1854.

Inspection Committee.—On the motion of Colonel Challoner, seconded by Mr. Brandreth, the following Committee was appointed "to inspect any site or sites of ground proposed for the Show-yard in 1851, and to report to the Council their suitableness or otherwise for the purposes of the Society, namely, the Stewards of the Cattle and Implement Departments, with the members of the Yard Committees, and the addition of Lord Portman, Mr. Pusey, M.P., Mr. Raymond Barker, Mr. Fisher Hobbs, and Mr. Shaw of London.

The Council then adjourned to their weekly meeting on Wednesday next, the 10th of April. On the following Wednesday, April 17, at 12 o'clock, Prof. Way, Consulting Chemist to the Society, will deliver a Lecture to the members, in the House of the Society, "On the Chemical Principles of Cheese and Butter making."

Farm Memoranda.

The Farm of Sir John Conroy, about four miles to the south-east of Reading, is managed in such an admirable manner, that we shall devote a brief space to its description.

It consists of various soils, but principally fair stock land, not very deep in staple, some of which lies on a retentive substratum of clay, and some on an open gravel. Four years ago (for Sir John is a farmer of only four years' standing) the whole of the arable farm, comprising about 320 acres, exclusive of the park surrounding the mansion, was divided into numerous small fields by high wooded banks, every one of which has been removed, the soil in them being scattered over the adjoining land, while a sufficient number of the best trees were left to give variety and charm to the landscape. Every acre of the land was then drained with inch pipes, laid 4 feet deep, the drains being 15 feet apart in the stiffer lands, and 30 feet apart in those which were of a drier character. Further experience leads Sir John to think that a greater distance would have sufficed on the latter, much of which is of that nature which most farmers would consider a waste of money to drain at all, and probably nothing could better convince them of the incorrectness of such an opinion than a peep into what Sir John calls "the bigot's hole," a square box, in which, at a depth of between 4 and 5 feet, two main pipes are to be seen constantly pouring the drainage of 40 acres of this description of soil. Immediately following the drainers the whole farm was trenched by forks to a depth of 22 inches, the surface being carefully retained uppermost by being thrown forward to cover the previously trenched portion of subsoil. The cost of both operations, drainage and trenching, was nearly 12*l.* an acre, so that if a great improvement has been effected it must not be overlooked that it has been done by a large outlay of capital. Farm roads were at the same time made, which serve the double purpose of accommodating the different fields, and separating the one from the other. Commodious farm buildings were also erected. The land is managed strictly on the four-course system, every modern improvement which is applicable to this system, and has been previously proved to be profitable, being adopted. The Swedes, of which we saw an excellent crop, are manured with yard dung of the richest kind, and 4 cwt. of superphosphate to the acre. A portion is drawn for consumption in the stalls, and the rest are eaten on the ground by sheep, that part which is still to be eaten having been laid in heaps and covered with a little earth, to shield them from the changes of weather, and to prevent them from exhausting themselves and injuring the ground by running to seed. The sheep are a southdown ewe stock, crossed with a short-woolled Leicester, the produce being a half-bred lamb which grows and fattens very rapidly. At the end of the fold, next the untouched Turnips, spaces are left through which only the lambs can pass in and out, and here boxes are placed containing an unlimited supply of bruised Beans, Peas, and oilcake, of which they partake liberally, besides nibbling at the green Turnip-tops, and at the Turnips themselves as their mouths get strong. They are ready for the London market by Good Friday, and as soon after that as possible, the ewes being immediately afterwards put on the best feeding, to hurry them on for the market with the utmost despatch, the great object being to turn the capital over in the shortest possible time in which a profit can be secured. A new stock is again purchased at the first favourable opportunity after the old has been disposed of. As the Turnips are consumed the land is ploughed and sown with Barley, drilled in rows 6 inches apart, by Garrett's drill, two bushels of seed having been last year used to the acre, though, considering the high condition of the land, and its perfect drainage, that quantity is thought too much, 1½ bushel is to be tried this season. The produce last year was seven quarters an acre. The Barley is followed by Clover and seeds, part of which is fed and part mown. After the second crop is fed or mown the ground is ploughed (Howard's Bedford two-horse plough being in all cases used and much approved), and then rolled by Crosskill's clod-crusher. The ground is then harrowed, and one bushel of Wheat per acre drilled in in rows 22½ inches apart, and nothing can exceed the regularity and beauty of the plant at this moment. But those who may wish to imitate Sir John in the economical use of seed must not forget the important adjuncts of that system already described, the perfect drainage and disintegration of surface and subsoil, the subsequent manuring of the Turnip crop, the corn and cake fed sheep, and the final consolidation of the furrows, by all of which, as far as possible, security is taken that nearly every grain sown shall vegetate. As soon as necessary in spring the crop is hoed by Garrett's horse-hoe, two of which are used on this farm, and by them 20 acres a day can be got over. Sir John thinks very highly of this implement, not more from the speed and economy than from the efficiency with which it does its work. The Wheat crop last year averaged 6 quarters an acre of very superior quality, and it has hitherto varied with Sir John from 4 to 5 and 6 quarters an acre. Previous to his taking the farm in hand, the produce seldom exceeded 2 to 2½ quarters an acre. Adjoining the farm buildings is the farm garden, a plot of six acres, where vegetables, such as Cabbages, Mangold Wurzel, Potatoes, &c., are cultivated, chiefly by manual labour, for the consumption of the house-fed stock and pigs. Near this is a pump, communicating with the liquid manure tank, from which, by a hose attached to the pump, the surrounding land, to the extent of 20 acres, can be watered. The hose has been in use for the last two years without being much worn out. It is manufactured by Paterson, of Manchester, and costs 5*d.* a foot. The rick-yard next demands notice, as a new space, as large as the original yard, has been cleared in order to afford room for the increasing bulk of the crops. Resting on the outer wall of the rick-yard is a light thatched sheep-shed, with well littered yards, into which the ewes are brought for shelter to drop their lambs, and where they remain for a few days till the lambs are strong enough to follow them to the Turnip-fold. When the whole of the ewes have lambed the hurdles enclosing the yard are removed, the solid dung is carted out, and the land beneath is then dug and planted with Potatoes, for which it is sufficiently manured by the liquid which has penetrated it. The shed, of course, remains for use in the same way in subsequent years. Next the rick-yard is the barn, the whole machinery of which is driven by a 10-horse steam-engine, the cost of working which is 2*d.* an hour for labour and 10*d.* for coals, or 1*s.* an hour altogether. A covered gallery extends along the back of the barn, through the length of which the driving-shaft of the engine passes, with pulleys and belts at intervals for attaching the power to the several machines as they are wanted. In this gallery Sir John proposed to erect steaming chests, should he adopt the plan of giving his stock cooked food. The threshing machine is an inferior one, but it is fitted with an excellent shaker, by Garrett, the double motion of which at once separates the grain from the straw, and causes it to fall lengthways from the machine. It is then passed to a straw-cutter, by which it is cut as required, either into 4-inch lengths for litter, in which state all the litter of the farm is used, or into half-inch lengths for food, a hopper from each side of the machine carrying the respective kinds into separate compartments of the building beneath. A corn and cake bruiser and Turnip-cutter are all attached, when requisite, to the shaft of the steam-engine. Immediately opposite to the barn door is a high open shed, in which straw is stored dry. One side of the square is the implement shed, in which every implement not in use is kept under cover; and it is proper to mention here that Sir J. Conroy has disposed of all his waggons and adopted Crosskill's one-horse carts, having fully persuaded himself, after trial of both, that there is no comparison in point of economy of labour between the two, this being a level part of the country, with good roads through the farm. The more intricate machines are kept under lock, the house being provided with shelves, on which the different parts of the machines not required for the particular work in hand are carefully arranged. Adjoining this is a carpenter's shop, and at another part of the buildings a smithy. The farm stable has at one end of it a harness-room, well lighted, where all the cart and plough harness is kept, and which is cleaned every Saturday afternoon. Water is supplied by pipes to the stable and harness-room, and indeed to every part of the farm buildings. The fattening oxen are kept in loose boxes, under cover, with a passage before them for the convenience of the feeder. Each box is supplied with water, all soft water, which Sir John rightly considers of much importance to the thriving condition of his stock. The centre compartment of the building is occupied as a store for preparing the food, cutting Turnips, mixing meal, cake, &c. — the "kitchen," as it is termed. The next yard is the great feature of the in-door management—the pig establishment—upon which great attention is bestowed. It should have been mentioned before that the only things sold off this farm are live stock and Wheat, everything else, including the Barley, being consumed on it. Of course, when a fine malting sample of Barley is produced it is sold, and an equivalent quantity of feeding Barley bought to replace it. Besides this, Sir John buys a large quantity of cheap grain and oilcake for his stock. He endeavours to fatten, every year, as many hogs as he has acres, and has therefore always on the farm between 300 and 400, 80 of which are in the fattening pens to be finished. The only food they receive is Barley-meal and water, a "kitchen" being conveniently placed for each pig-yard, with a trough sunk in the ground into which the requisite quantity of meal is put among water, in the evening, for the morning's feed, and the trough again filled in the morning for the evening's meal. Each pig is calculated to consume about 10 bushels of Barley in the course of feeding, that is, from its birth till it is sent off fat. The 80 fattening pigs are kept in three yards, with a shed, all well littered with cut straw. There are many other interesting points of detail which we have not space to enumerate. The houses are all spouted to carry off rain-water, and every particle of liquid as it escapes from the feeding-houses is secured in drains and carried to the tank. An eating-room, with benches and a table, is provided for the people to eat their mid-day meal, in which there is a fire for cooking, and a wash-hand basin in the corner, with water laid on, which is regularly used at night after work is over. The same orderly precision which regulates all the departments of the farm is pre-eminently displayed in the management of the farm servants. These are engaged by the week, the present rate of wages being 10*s.* They are paid every Saturday in small silver, so that they may have no necessity to go for change to the public-house. A serious fault is never passed over (about which rule, however, we desire to express no opinion); no high words or abusive language is permitted to be used to any person engaged on the farm; but, should any misconduct occur, or any serious neglect of duty, the offender receives with his pay on Saturday a notice that his further services are dispensed with. All extra time is paid for, and every man made to feel that, while the exact performance of his duty is required, he is at the same time treated with perfect fairness. We can testify to the intelligent appearance of the men, and the cheerful *esprit* with which they seemed to be animated. Such is the style of farming adopted by a gentleman bred in the camp and the Court—a farmer of four years' practice, but of many years' observation; who, notwithstanding all the outlay he has made, finds the business remunerative. We have been thus minute in our description, in the hope that other country gentlemen, now compelled by necessity to look strictly to their own business, may be tempted to take a lesson from Sir John Conroy, and to learn from him how much healthful excitement is to be obtained by personal attention to the business of farming. *Times.*

Miscellaneous.

Landlord and Tenant.—This man came to the country 13 years ago, with not more than 100*l.* of

capital. His landlord lent him 300*l.*, and with this he contrived to stock and carry on a farm of 300 acres. He was very skilful in the management of sheep-stock, and introduced the best rams from England, with which he improved his own stock, and then sold their produce at high prices in the surrounding country. So well did this succeed, that in a few years he repaid his landlord the borrowed money, besides, at the same time, greatly increasing the numbers and quality of his farm-stock. The frightful increase of rates, with diminished prices of produce, alarmed him: he found the capital which he had accumulated by skill and industry slipping away; he could not get what he considered an adequate abatement of rent from his landlord, though the increase in his rates amounted to nearly a second rent; so, availing himself of the power of surrender, which is fortunately a clause introduced into most Irish leases, he determined to sell all off, and quit the country for New Zealand. After paying all his debt, he has retired with a capital of 1000*l.*, and his farm is abandoned to the landlord, who is now anxious to get a solvent tenant at a lower rent than, I am assured, this man would have gladly paid, and remained in the country. But how much does this single example teach! First, that the soil yields a grateful return to industry and skill; second, that these are marred by the impolicy of placing the pressure of the rates exclusively on the tenant (which is unhappily the law in Ireland), thereby driving out of the country a prosperous, skilful farmer, whose example was of the utmost benefit in a district where these qualities are so deficient, but who felt himself compelled to remove his capital from the danger in which it stood of being absorbed in the general poverty of the country; and third, the short-sighted policy of the landlord (too common, I lament to say, and mainly to be attributed to a want of that knowledge of the proper business of a landlord, to which I have already had occasion to refer), in refusing to share the difficulties of the times with his tenant, because he was a solvent man,—and the natural consequence of this in disgusting the tenant, who then abandoned the farm, for which its owner cannot now get a solvent tenant at the greatly reduced rent he is at length willing to accept for it. *The Plantation Scheme, by Mr. Caird.*

Notices to Correspondents.

To Correspondents: The answers to some of the inquiries received are unavoidably postponed for a week.

Churn: *C J W.* We use one of Attwood's, of Lewes. It answers very well. The "Anthony" churn just introduced from America has a high character.

Compost: *A.* The gas lime is not proper for immediate application to the land. You might water your dry manure with ammoniacal liquor, and turn it over, and let it remain for 3 weeks before applying it. That would do. But your lime contains very little ammonia, if any. It is useful, because by exposure to the air it ultimately becomes, in a great measure, gypsum; and it should be exposed to the air long before it is used.

Cow: *Sigma.* If you can manage to water the plot after every cutting with dilute liquid manure, nothing will pay better than Italian Rye-grass as cow food. For winter food, Mangold Wurzel is far better than Swedes, which latter are, we believe, not so good as Carrots.

Farm Dung: *J C S.* You might throw very dilute acid over the heap, from a bucket, in winter. A gallon of acid to every ton of dung would not be enough, according to the ordinary composition of farm manure; but it would be enough to determine the feasibility of the practice. You should dilute it with 12 or 14 gallons of water, and see that the whole is wetted. But to cover up the heaps with clayey and vegetable mould is the cheapest method of detaining the products of decomposition.

Garden Farm: *C J W* says, I would recommend "A Poor Curate" to sow it forthwith with Parsnips and Carrots, digging in a good dressing of soot and salt, say 15 bushels of soot and 4 of salt, or perhaps he would prefer to dig it a second time. Let him distribute the dressing over the rough dug ground, as it has laid, he says, all the winter; then level finely, and sow the seed in drills. With the stock of food, say 15 tons (or 10 more probably, if shaded by any Apple trees, &c.), I propose he should fatten pigs in the winter, by which time I shall be happy to afford him further information, if spared.

Grasses: *A B C.* Sow per acre, along with 1 bushel of Barley per acre, as soon as possible, if your land is in good tilth, Aira cæspitosa *lutescens*, 2 lbs.; Alopecurus pratensis, 2; Anthoxanthum odoratum, ½; Avena flavescens, 1; Festuca duriuscula, 3; F. pratensis, 2; F. heterophylla, 2; F. rubra, 1; Lolium italicum, 3; L. perenne, 5; Phleum pratensis, 1½; Poa nemoralis, 4; P. trivialis, 2; Lotus corniculatus, ½; L. major, ½; Trifolium pratense *perenne*, 3; T. repens, 5; total, 37½ lbs.

Green Crops: *Rusticus.* By the use of abundant manuring, liquid and other, you can grow per acre, on a fertile loam, 40 or 50 tons of the Drumhead Cabbage—30 or 40 tons of Mangold Wurzel—3 or 4 cuttings of Italian Rye-grass, each weighing 8 or 9 tons—10 or 12 tons of Rye, followed by 20 to 24 tons of Swedes, the Mangold Wurzel, or Cabbage—10 or 12 tons of Winter Vetches, followed by either of these crops. Any of them would do for dairy food. For many of them you could get direct sale; but properly consumed on the farm, their consumption would furnish the means of a constantly increasing fertility. We should like to see a small beef-factory established on some small farm, where cattle food alone should be grown, and cattle food bought, the manure being applied all in the liquid form by pipe. Such a scheme, we believe, might be profitably carried out.

Guano: *Irish Subscriber.* Dr. Ure's analysis of a first-rate Bolivian guano, and of "Chincha guano" from Peru, respectively give the following results:

	Bolivian.	Peruvian.
Per centage of ammonia	15.244	16.25
Phosphate of lime, magnesia	26.5	22 5
Water	6.5	10

Professor Johnston gives the following account of guanos:

Variety.	Water, p. cent. from	Organic Matter, from	Phosphates, from
Bolivian	5 to 7	56 to 64	25 to 29
Peruvian	7 — 10	56 — 66	16 — 23
Chilian	10 — 13	50 — 56	22 — 30
Ichaboe	18 — 26	36 — 44	21 — 29
Saldanha Bay	17 — 34	14 — 22	45 — 56
Patagonian	14 — 40	16 — 38	17 — 40

Irrigation: *Inquirer.* If the water can be directed over it, so as everywhere to keep moving, no doubt the pasture will benefit.

Labourers: *A Saul.* Thank you: but the letter would be more properly confined to the *Mark Lane Express* than made the subject of discussion here.

Large Poultry: *A Z.* The largest geese (of the domestic sort) are the Toulouse geese. The largest hens are certain Malays imported from Shanghae, also certain fowls likewise from Shanghae, which we have named Shanghae fowls. [See the second edition of Dixon's Poultry.] Some of these appeared at the Birmingham Show, under the name of American fowls. The largest Turkeys are the oldest: a bird must live four or five years to attain his full size: but the genuine Norfolk Turkeys never acquire weights equal to those of either the Cambridge or American breed of the same age.

Maize: *C A.* Sow towards the end of May, in rows 26 inches apart, and the seeds being about 2 or 3 inches apart in the rows. It will be a bulky crop of green food in July.

Mangold Wurzel: *J E M.* Choose the yellow globe seed. Apply as much farm-yard dung as you can spare, up to 20 cubic yards per acre, and put it in the drills, and before splitting the drills, sow 2 cwt. of guano mixed with 2 cwt. of salt per acre, broadcast, over the ground. You may sow in the middle of this month. Dibble 15 inches apart, the rows being 26 inches wide. Do not cover the seed more than half an inch. You will need 6 or 7 lbs. per acre.

Ornamental Poultry, &c.: *A Subscriber.* A full Index is given with the second edition of "Ornamental and Domestic Poultry," but there are difficulties in the way of preparing one for the first.—If the volatile salts have to pass through a damp coating of clayey material, the same rule will no doubt hold true of them as obtains in the process of filtration. But we agree with you that this might usefully have been made the subject of specific experiment during Mr. Way's most interesting and successful investigation.

Ornamental Poultry, by the Rev. E. S. Dixon, is now reprinting, with additions, and will shortly be published, price 5*s.* 6*d.*, cloth. May be had of all booksellers, and at the Office of this Paper.

Prices: *W R.* You will see something about American prices in this Number.

Rearing Lambs: *A X Y.* Having some lambs to bring up by hand—we give them new milk from the cows (warm); can any one inform us if there is any better method, or what is the best method to adopt to fatten them, so as they would be in good condition, in three months' time, fit for the butcher? Would anything mixed in the milk, in the way of flour assist in the process? [Try Oatmeal and water along with a less quantity of milk.]

Rural Chemistry, by R. Solly, price 4*s.* 6*d.*, second edition, revised and enlarged, may be had of all booksellers, and at the Office of this Paper.

Sainfoin: *Cornwall.* Sow it towards the end of April, at the rate of 3 bushels per acre, just as Vetches are sown. It will do very well to sow along with Barley, in rows 6 inches apart, crossing the Barley drills. It should be sown on a calcareous, rocky, or chalky soil. Giant Sainfoin is sown just in the same way. Both sorts will occupy the ground for five years, and should be treated during that time as you would treat Grass land, dressing it well at least every other year with farm manure or guano.

Steam Power: *A Subscriber.* Can you give information as to the best mode of applying steam power on a moderate scale, say 3 or 4-horse power, to the purposes of threshing, winnowing, grinding, sawing, Flax scutching, and any other purposes for which there are portable machines, which can, when required, be successively brought into relation with the moving power, the waste steam to be applied to the cooking of the food of cattle, also to steeping Flax upon the new system. [The subject seems one on which our correspondent should consult an engineer. Perhaps, however, some of our correspondents may have experience on the subject which they may be willing to communicate.]

Yeast: *H G.* We never knew of its being used as a manure. Perhaps some may have tried it.

*** Communications reaching town after Wednesday, cannot be answered untill the following week.

Markets.

SMITHFIELD, Monday, April 1.

The supply of Beasts is very large and the demand is small, owing to the change of weather and this being Easter week. Many remain unsold, and a reduction of fully 2d. per 8 lbs. is submitted to, to effect sales. The number of Sheep is also large; a few choice Downs are pretty readily sold at rather less money, but many cannot be sold at any price. Lamb is selling lower than on Friday. Calves are not plentiful, but trade is no better. From Holland and Germany there are 277 Beasts, 610 Sheep, and 44 Calves; from Scotland, 400 Beasts; from Norfolk and Suffolk, 2200; and 150 from the midland counties.

Per st. of 8 lbs.	s	d	s	d
Best Scots, Herefords, &c.	3	4 to 3	6	
Best Short-horns	3	0 — 3	2	
2d quality Beasts	2	6 — 2	10	
Best Downs and Half-breds	4	0 — 4	2	
Ditto Shorn				

Per st. of 8 lbs.	s	d	s	d
Best Long-wools	3	6 to 3	8	
Ditto Shorn				
Ewes & 2d quality	2	10 — 3	2	
Ditto Shorn				
Lambs		5	4 — 6	0
Calves		3	6 — 4	4
Pigs		3	0 — 4	0

Beasts, 3513; Sheep and Lambs, 19,960; Calves, 95; Pigs, 190.

Friday, April 5.

Although the supply of Beasts is not very large, it far exceeds the demand, and on the average prices are lower. The number of Sheep is only moderate, but they cannot all be sold, notwithstanding lower rates are submitted to. It is difficult to make 6s. of the choicest Lambs. Trade is very dull for Calves, and only a few make anything over 4s. From Germany and Holland there are 21 Beasts, 30 Sheep, and 97 Calves; from Scotland 200 Beasts; and 132 Milch Cows from the home counties.

Per st. of 8 lbs.	s	d	s	d
Best Scots, Herefords, &c.	3	4 to 3	6	
Best Short-horns	2	10 — 3	2	
2d quality Beasts	2	4 — 2	8	
Best Downs and Half-breds	4	0 — 4	2	
Ditto Shorn				

Per st. of 8 lbs.	s	d	s	d
Best Long-wools	3	6 to 3	8	
Ditto Shorn				
Ewes & 2d quality	2	10 — 3	2	
Ditto Shorn				
Lambs		5	0 — 6	0
Calves		3	4 — 4	0
Pigs		3	0 — 4	0

Beasts, 811; Sheep and Lambs, 5130; Calves, 203; Pigs, 135.

POTATOES.—Southwark, April 1.

The Committee report that the market is well supplied both coastwise and Continental. Trade is very heavy, which has compelled salesmen to store more than is desirable at this time of year. The following are the present prices:—York Regents, 70s. to 190s. per ton; Wisbeach do., 70s. to 80s.; Scotch do., 60s. to 70s.; Scotch cups, 50s. to 65s.; Scotch whites, 40s. to 45s.; French whites, 55s. to 70s.; Belgian do., 40s. to 55s.; Rhenish do., 40s. to 55s.; Dutch, 40s. to 45s.

HAY.—Per Load of 36 Trusses.

Smithfield, April 4.

Prime Meadow Hay	66s to 72s	Clover	60s to 84s
Inferior ditto	50 63	New Clover	— —
Rowen	— —	Straw	23 27
New Hay	— —		J. Cooper.

Trade very dull.

Cumberland Market, April 4.

Prime Meadow Hay	68s to 74s	Inferior	60s to 70s
Inferior ditto	50 63	New Clover	— —
New Hay	— —	Straw	25 30
Old Clover	75 84		Joshua Baker.

Whitechapel, April 4.

Fine Old Hay	60s to 66s	New Clover	—s to —s
Inferior ditto	50 55	Inferior ditto	60 70
New Hay	— —	Straw	20 26
Old Clover	75 84		

COVENT GARDEN, April 6.

Vegetables are well supplied, but many kinds of Fruit are still scarce. A few Strawberries have made their appearance. Hothouse Grapes are not very plentiful. Pine-apples are scarce and inferior in quality. Walnuts and Chestnuts are abundant; and Oranges and Lemons sufficient for the demand. Amongst Vegetables, Turnips and Carrots are good, and there is some very good Broccoli in the market. Potatoes are unaltered since our last account. Lettuces and other salading are sufficient for the demand, and so are Mushrooms. French Beans, Asparagus, Seakale, and Rhubarb are becoming very plentiful. Cut Flowers consist of Heaths, Pelargoniums, Bignonia venusta, Primulas, Camellias, Cinerarias, Azaleas, Lily of the Valley, Epacrises, Acacias, Lilacs, and Roses.

FRUITS.

Pine-apples, per lb., 6s to 10s	Almonds, per peck, 6s
Grapes, Portugal, p. lb., 9d to 1s	— sweet, per lb., 2s to 3s
Pears, per doz., 6s to 10s	Walnuts, p. 100, 1s 6d to 2s
Apples, kitchen, p. bsh., 4s to 6s	— p. bush., 16s to 24s
Lemons, per doz., 1s to 2s	Nuts, Bar., p. bush., 20s to 22s
— per 100, 6s to 12s	— Brazil, p. bsh., 12s to 16s
Oranges, per doz., 9d to 1s 6d	Kent Cobs, 90s to 100s p. 100 lbs
— per 100, 5s to 12s	

VEGETABLES.

French Beans, p. 100, 1s 6d to 3s	Onions, p. bushel, 3s 6d to 4s 6d
Seakale, per punnet, 1s to 3s	— Spanish, p. doz., 1s 6d to 4s
Asparagus, p. bund., 2s to 7s	Shallots, per lb., 4d to 8d
Rhubarb, p. bundle, 6d to 1s	Garlic, per lb., 4d to 8d
Cabbages, per doz., 1s to 1s 6d	Lettuce, Cab., p. sc., 4d to 9d
Cauliflowers, p. doz., 1s to 4s	Endive, per score, 1s 6d to 3s
Broccoli, p. doz. bundl., 8s to 10s	Mushrooms, p. pot., 9d to 1s
Greens, per doz., 3s to 4s	Small Salads, per punnet, 2d to 3d
Sorrel, p. hf. sieve, 1s to 1s 6d	Fennel, per bunch, 2d to 3d
Potatoes, per ton, 60s to 120s	Savory, per bunch, 2d to 3d
— per cwt., 3s to 7s	Thyme, per bunch, 2d to 3d
— per bush., 2s 6d to 3s 6d	Parsley, p. doz. bun., 2s to 3s
Turnips, p. doz. bun., 1s 6d to 2s 6d	— Roots, p. bdle., 9d to 1s
Red Beet, per doz., 9d to 1s	Marjoram, per bunch, 2d
Horse Radish, p. bdl., 1s to 4s	Mint, green, per bunch, 9d to 1s
Cucumbers, each, 1s 6d to 4s	Watercress, p. doz. bunches, 6d to 9d
Leeks, per bunch, 1d to 1½d	Corn Salad, p. hf. sieve, 9d to 1s
Celery, p. bundle, 8d to 1s 6d	
Carrots, per bun., 4d to 6d	
Spinach p. sieve, 2s to 3s	

HOPS.—Friday, April 5.

Messrs. Pattenden and Smith report that there is no alteration since Monday. Fine yearlings are in good demand.

MARK LANE.

Monday, April 1.—The supply of Wheat from Essex, Kent, and Suffolk, this morning, was very small, which enabled the factors to dispose of it on the terms of this day se'nnight; foreign met a dull retail inquiry at our quotations.—Fine English and foreign Barley maintain their late value, but other qualities are difficult of disposal.—Beans and Peas are unaltered in value.—Oats are a free sale, but stale and inferior descriptions are the turn cheaper.

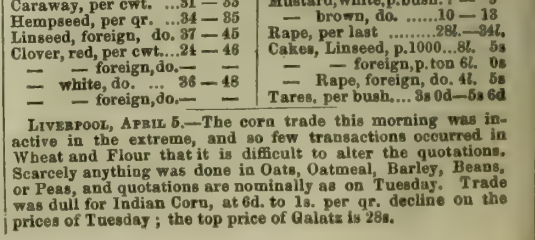
Foreign						



Friday, April 5.—With the exception of foreign Oats, of which the arrivals have been good, the supplies of grain this week are small. The market this morning was moderately attended, and fine foreign Wheat attracted some attention; nevertheless sales were quite of a retail character, and at no improvement in price; English is unaltered in value, as are also Barley, Beans, and Peas.—Oats are in fair demand, but our quotations are not exceeded.—For Indian Corn there has been an increased inquiry, and 28s. 6d. obtained for Galatz afloat.—The Flour trade continues much depressed, and the turn of prices in favour of the buyer.

Liverpool, April 5.—The corn trade this morning was inactive in the extreme, and so few transactions occurred in Wheat and Flour that it is difficult to alter the quotations. Scarcely anything was done in Oats, Oatmeal, Barley, Beans, or Peas, and quotations are nominally as on Tuesday. Trade was dull for Indian Corn, at 6d. to 1s. per qr. decline on the prices of Tuesday; the top price of Galatz is 28s.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew-lane, on WEDNESDAY, April 10th, and THURSDAY 12th, 1850, a First Class collection of Carnations, Picotees, and Auriculas; also Climbing and other Roses; choice Dahlias, Verbenas, Fuchsias, Pinks, Pæonies, &c. May be viewed the morning of sale. Catalogues had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

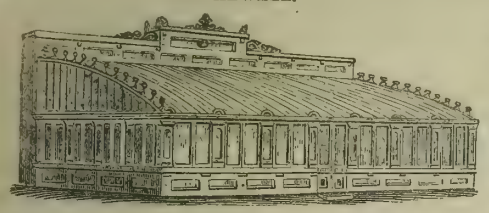
EAST INDIAN ORCHIDS.

MR. J. C. STEVENS begs to announce that he received by the last overland mail a select parcel of ORCHIDS, in fine condition, collected in the central provinces of Ceylon, and comprising many rare varieties of Vandas, Dendrobiums, Cœlogynes, Renantheras, &c.; they will be sold by Auction at his Great Room, 38, King-street, Covent Garden, on FRIDAY, the 12th inst., at 1 o'clock precisely.—Catalogues will be forwarded in due course.

TO MARKET GARDENERS.

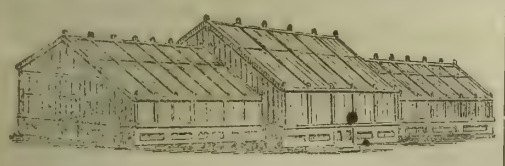
TO BE LET, on Lease, with immediate possession, a desirable MARKET GARDEN, situate at Turnham Green, near the high road, containing upwards of 16 acres, with good House and Offices. To a tenant of undoubted responsibility the extensive and valuable stock of Trees, Shrubs, and Bushes will be included in the letting and scheduled in the Lease.—Apply to Mr. W. S. PATERSON, Solicitor, 7, Bouverie-street, Fleet-street, London.

PATENT WOOL NETTING FOR COVERING TREES, EARLY FRUITS, and FLOWERS.—No article so effectually preserves Fruit-trees from Frost, Cold Winds, Blight, and Insects, as WOOL NETTING.—Agents, Duncan Hairs, 109, St. Martin's-lane; Minier, Nash, and Nash, 60, Strand; Hurst and M'Mullen, 6, Leadenhall-street; Charlwood, 14, Tavistock-row, Covent-garden; Kernan, Great Russell-street, Covent-garden; and Clark, King-street, Covent-garden, London.



PATENT SPADES, DAISY RAKES, SCYTHES, Draining, and other Garden Tools. Mole Traps, 6s. per dozen. Carpenters and Smiths' Tools, &c. Ladies' Garden Tools, 7s. 9d. a set. Sword-scrapers for Gardens, 1s. 2d. each. Patent Fumigation, for destroying insects on plants, in greenhouses, &c.: at Messrs. J. H. BOOBBYER and Co.'s (late STURCH and BOOBBYER), Ironmongery, Brass-foundry, Nail and Tool Warehouse, 14, Stanhope-street, Clare-market, London. Established nearly 200 years for the sale of goods from the best Manufactories at the lowest prices. Goods forwarded to any part on the receipt of remittance.

GARDEN ENGINES, SYRINGES &c.—CAUTION.—The well-known reputation of READ'S Engines, Machines, and Syringes, has led to the nefarious practice of placing Cards in Shop Windows, with the words "READ'S PATENT" over Syringes of the very commonest description. R. READ begs to Caution the Public against being deceived by such false representations, as many of these Instruments, upon trial, will be found defective and useless.—READ'S Syringes may be known by the Royal Arms, and the words "READ'S PATENT." Manufactured only at 35, Regent Circus, Piccadilly, London.



HALLIMAN'S FRUIT PROTECTOR, Registered March 22d, 1850, was offered, for the first time, March 2d, 1850; was patronised by Richard Holland, Esq., 42, Grosvenor-square, London; and was shown in private at Buckingham Palace, 13th March, 1850, and returned with a satisfactory written reply. It has been named the Fruit Preserver, and pronounced to be an article of great utility by a great number of first-rate Noblemen's Gardeners. The interest of the money laid out will not amount to more than ¼d. per Peach, Grapes 1d. per bunch, per year. O. H. will be thankful to receive any order, and will complete it as soon as it is in the Sole Inventor's power. — C. HALLIMAN, 1, Queen's-place, Norland-square, Kensington, Middlesex.

HYDRAULIC ENGINES, WATER RAMS, &c., on Improved Principles; Engines worked by Steam or Hydraulic power, to raise from 1 gallon to 1000 per minute to a height of 500 feet, and from a depth of 900 feet. Douche, Vapour, Hot-air, and all other kinds of Baths. Buildings, Conservatories, &c., heated by Steam, Air, or Water. Boring, Sinking, and Collecting of Water, &c. Towns supplied. Direct to JOHN LEGG, Cheltenham.

DESIGNED, ERECTED, AND HEATED BY J. THOMSON, FOR J. SHUTTLEWORTH, ESQ., NEAR BAKEWELL.

HOTHOUSE DESIGNING, BUILDING, AND HEATING.—Every description of Horticultural Structure designed, Erected, and Heated by Hot Water, common Flues, and other modes, on the most economical and improved modern principles. Testimonials and references from Noblemen and Gentlemen who have kindly patronised, for more than 15 years past, J. THOMSON and Co.'s Modern and Simple Mode of Constructing, Building, Warming, and Ventilating Garden Structures.

J. THOMSON having had full 25 years' experience as a practical Horticulturist, Landscape Gardener, and Garden Architect, in her Majesty's Royal Gardens at Windsor, Kew, and other places, most respectfully solicits the favours and patronage of Noblemen and Gentlemen about to form new, or to alter and embellish their present Parks, Gardens, &c.

Plans and Estimates for remodelling Parks and Gardens, or for Building and Heating Hothouses, and other Garden improvements, furnished on application to J. THOMSON and Co., Hothouse Builder, &c., King-st., Hammersmith, near London.

*** Rustic Summer Houses, Chairs, Melon Boxes, and Lights, Vases, and similar Garden Ornaments, made on the shortest notice.

STOUT AND PORTER.—JENNER, WICKING, and JENNER, are now delivering for cash to private families their celebrated PORTER at 1s., and imperial STOUT at 1s. 4d. per gallon. May be had in casks of 4½, 9, 18, and 36 galls.

N.B. Their Ales are now in very fine condition.

South London Brewery, Southwark-bridge-road.

LOOK TO YOUR STABLE EXPENDITURE, and attend to its economy and Corn-dealers' Bills.

CHAFF MACHINES.—Horse Masters should give cut Hay or Wheat Straw with the Oats they allow, and those Oats should be bruised.—MARY WEDLAKE'S superior CHAFF MACHINES and OAT BRUISERS, manufactured on the premises (40 years established), 118, Fenchurch-street, and 8, Billiter-street.

N.B. Chaff-cutting and Oat-bruising Machinery by horse-power. Old Machines repaired.

HOW TO KEEP A HORSE FOR LESS THAN ONE SHILLING PER DAY!! and make the Animal look better than he now does when you are paying not less than 12s. to 13s. per week. Consider the enormous saving in these hard times—times of cheapness!!

DO YOU BRUISE THE OATS YOU GIVE YOUR HORSES? No. Then you lose one bushel out of every three, and your Cattle do not do half so well.—MARY WEDLAKE AND CO.'S OAT BRUISING MILLS. Superior Chaff Engine, simple in construction, doing from 50 to 500 bushels daily and more. Nearly all respectable Coachmasters and Brewers in London use these implements. To be seen at 118, Fenchurch-street, opposite Mark-lane, close to the Blackwall Railway.

N.B. Linseed Mills, Bean Mills, and Malt Mills, in great variety.

MANURE IS MONEY.—MOST IMPORTANT TO LAND PROPRIETORS, FARMERS, GRAZIERS, GARDENERS, AND OTHERS. A new and excellent Treatise.

THE FARMER'S FRIEND AND COMPANION; showing how to farm to meet the times, and save money, by introducing, for the benefit of the agriculturists, a new and most valuable receipt for the manufacturing of the New Patent Manure, which will be sent gratis, and can be manufactured without a license by every farmer, as the preparation is most simple and cheap, and suitable for all seasons, soils, and crops, at the trifling expense of 1l. per acre, warranted equal to 12 loads of farm-yard manure, and a perfect substitute for all foreign manures. Also showing how to fatten every description of Stock and Poultry, at one-third the cost now adopted, the best and cheapest method of draining, &c. This valuable Treatise on Farming and Grazing, registered and entered at Stationers' Hall, contains also a collection of 150 of the most valuable receipts ever discovered in agriculture for profit, &c., with full directions for use, by the late celebrated agriculturist, Mr. Ellman, and others, and patronised and highly recommended by H.R.H. Prince Albert, at Windsor Farm, the Royal Agricultural Society of England, their Graces the Dukes of Richmond, Portland, and Bedford, &c., and will be forwarded, without fail, by return of post, free, to any part of the country, by enclosing 12 postage stamps, addressed, pre-paid, to Messrs. MORGAN and Co., Post-office, Lisson-grove, Marylebone, London. Mind the address.

N.B. The receipt for manufacturing the Patent Manure can be had alone, by forwarding six postage stamps.

HARTLEY'S PATENT ROUGH PLATE GLASS. In submitting our list of prices, we would beg to direct attention to the Leading Article of the *Gardeners' Chronicle* of Saturday, Dec. 8, upon the subject of "Patent Rough Plate." Some alteration having been made in the mode of manufacturing this description of Glass, the quality is greatly improved, and we now supply it perfectly flat, and, by an arrangement with Messrs. HARTLEY and Co., precisely at their prices. Cut to order in panes of

SUPERPHOSPHATE OF LIME, GUANO, CRUSHED BONES, and all other artificial MANURES, at Messrs. HUNTS' Bone Mills and Manure Works, High-street, Lambeth, London. Established 1816.

MESSRS. NESBIT'S CHEMICAL AND AGRICULTURAL SCHOOL, 38, Kennington-lane, London.—A sound practical knowledge of Analytical and Agricultural Chemistry, Geology, Surveying, Levelling, Railway Engineering, &c., may be obtained in Messrs. NESBIT'S Academy, in addition to a good modern education.

Mr. NESBIT'S works on Arithmetic, Mensuration, Gauging, Land Surveying, English Parsing, &c., are published by LONGMAN and Co., and may be had of all Booksellers.

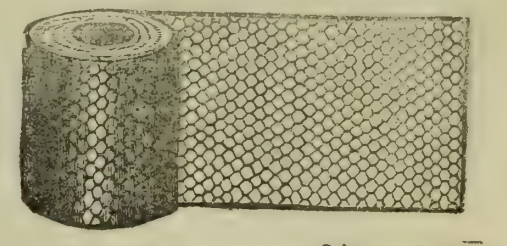
The terms of the School can be had on application either personally or by letter.

GLASS PIPES.

MESSRS. COATHUPES AND Co., GLASS MANUFACTURERS, of Bristol, and of Nailsea, Somerset, beg to inform Engineers and others, that they are prepared to supply GLASS PIPES of from 1 to 4-inch bore, in lengths of from 3 to 7 feet; the lengths being less as the diameters of the bores increase.

GLASS FOR CONSERVATORIES, HORTICULTURAL PURPOSES, &c.

T. MILLINGTON'S SHEET GLASS, which is of the best description, varying from 16 to 32 ounces, at from 2d. per foot and upwards; 100 feet and 200 feet cases of large Sheet Glass, for cutting up, at 2½d. per foot. British Plate Glass, from 1s. 2d. to 2s. per foot, according to size. Patent Rough Plate Glass, from ⅛ to 1 inch in thickness, from 4d. per foot upwards. Glass Slates and Tiles. Milk Pans from 12 to 24 inches diameter, from 2s. to 5s. each. Cucumber Tubes, from 12 to 24 inches long, at 1d. per inch. Lactometers, 7s. 6d. each. Wasp Traps.—Lists may be had, on application at the Warehouse, 87, Bishopsgate-street Without, same side as the Eastern Counties Railway.



THE GARDENERS' CHRONICLE.—TO BE SOLD, the first Six Volumes, half-bound, and in good condition, price 5l. — Apply to F. H. S., 221, Tottenham-court-road, Middlesex.

IRON AND WIRE FENCING, AND METALLIC BEDSTEADS.

THOMAS PERRY AND SONS, 252, OXFORD-STREET (NEAR HYDE PARK), And Highfields Foundry and Wrought-iron Works, Bilston, Staffordshire, Manufacturers of all descriptions of PLAIN AND ORNAMENTAL IRON AND WIRE FENCING, Park Entrance, Carriage and Field Gates, Wickets, &c.; Deer, Sheep, and other Hurdles; Hare and Rabbit-proof Wire Fencing; Iron Bedstead Makers to the Board of Ordnance; And Government Contractors.

The works of Messrs. PERRY being situated in the heart of the first iron district, they are enabled to execute all orders with the greatest facility; and on the most moderate terms. Drawings made and estimates prepared, if required. The show rooms contain an immense variety of every description of Iron and Wire-work, and are the largest in London. An Illustrated Catalogue of Bedsteads, with dimensions and prices, sent on application, post-free.

GALVANISED WIRE GAME NETTING.—7d. per yard, 2 feet wide.

	Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide ...	7d. per yd.	5d. per yd.
2-inch ,, strong ,, ...	9 ,,	6½ ,,
2-inch ,, extra strong ,, ...	12 ,,	9 ,,
1½-inch ,, light ,, ...	8 ,,	6 ,,
1½-inch ,, strong ,, ...	10 ,,	8 ,,
1½-inch ,, extra strong ,, ...	14 ,,	11 ,,

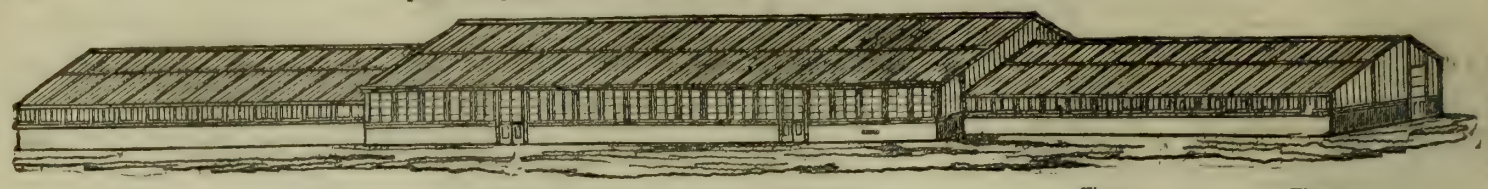
All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3d. per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

WIRE NETTING, ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

12 inches wide	3d. per yard	30 inches wide	7½d. per yard
18 ,, ,,	4½d. ,,	36 ,, ,,	9d. ,,
14 ,, ,,	6d. ,,	48 ,, ,,	1s. ,,



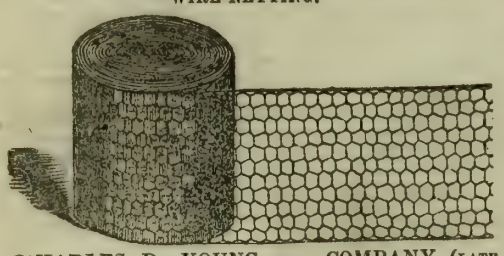
Galvanised do., 1d. per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1s. 6d. per running yard; if galvanised, 2s. Also every description of Wire Nursery and Fireguards, Wire House Lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1s. 10d. per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6d. per running foot; Flower Trainers, from 3d. each; Garden Arches, 20s. each; Flower Stands, from 3s. 9d. each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

GRAY, ORMSON, AND BROWN,

DANVERS STREET, CHELSEA,

Respectfully solicit the attention of the Nobility and Gentry to their superior manner of Erecting and Heating every description of Building connected with Horticulture. They have much pleasure in giving the following testimonial referring to the range of houses shown below.



Peach House, 30 by 16 feet. | Vinery, 30 by 16 feet. | Stove, 45 by 20 ft. | Greenhouse, 45 by 20 ft. | Vinery, 30 by 16 ft. | Vinery, 30 by 16 ft.

[ERECTED FOR JOHN SHAW LEIGH, ESQ., LUTON HOO.]

Extract of a Letter from Mr. FRASER.—"I have much pleasure in expressing my entire satisfaction with the range of houses you erected here. I may also state that my honoured employer, JOHN SHAW LEIGH, Esq., is perfectly satisfied. I have no hesitation in stating, that to the best of my knowledge, there is not a more complete range of glass in the country, as regards both building and heating. I may add that they are admired by every Gardener who has seen them. I shall have much pleasure in answering any references you may please to direct.

(Signed.) "JAMES FRASER, Gardener, Luton Hoo Park."

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG AND COMPANY (LATE W. AND C. YOUNG),

MANUFACTURERS OF IRON AND WIRE WORK, &c., 22, PARLIAMENT-STREET, WESTMINSTER, LONDON; CASTLE-BUILDINGS, DERBY-SQUARE, LIVERPOOL; 128, HIGH-STREET, EDINBURGH; and 32, ST. ENOCH-SQUARE, GLASGOW, beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

PRICES.—18 ins. high, 3*d.*; 24 ins., 1*s.*; 30 ins., 1*s.* 3*d.*; and 36 ins., 1*s.* 6*d.* per lineal yard.

Or a web of 100 yards, 18 ins. wide, will cost	..	£3	15 0
Do. of 100 yards, 24 ins. wide	..	5	0 0
Do. of 100 yards, 30 ins. wide	..	6	5 0
Do. of 100 yards, 36 ins. wide	..	7	10 0

If more or less than a web is required, it would be charged at the same rate per yard.

This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. YOUNG and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1*s.* is equal to 2¼ yards of another article in the market, the same width, at 9*d.* per yard. Samples for inspection sent free of expense.

C. D. YOUNG & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

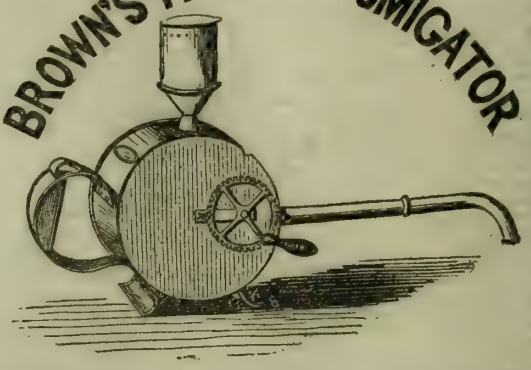
Workmen sent to all parts of Scotland, England, and Ireland.

MARQUEES, SUN-BLINDS, RICK-CLOTHS, &c.—Manufactory, Old Kent-road (facing the Bricklayers' Arms Railway Terminus), and 17, Smithfield-bars, London.

The guests are arriving; my villa has got
Quite a park-like appearance—a beautiful spot;
The band on the lawn, in the spacious marquee;
This tent for our dinner and that for our tea.

Marquees and temporary rooms superbly fitted up for Fêtes, &c., on most moderate terms, by THOMAS EDGINGTON and Co., Tents of every description, Rick Cloths with Poles, &c. Tanned Netting, for the protection of fruit trees from frost, blight, and birds, and for the security of fresh sown seed, either in gardens or fields, at unprecedented low prices, viz., 1*d.* per square yard, or 200 yards for 14*s.*, or 500 yards for 30*s.*, or 1000 yards for 50*s.* Gardeners and shopkeepers supplied by the cwt. New Archangel Mats and Scrim Canvas for wall fruit. Tarpaulings for houses under repair or hire. Orders and inquiries per post immediately attended to.

THE NEW PARASOL FOR 1850—"LA FLEUR DE LIS"—Registered, Act 6 & 7 Vic., cap. 65.—This elegant and useful article, of extreme lightness and durability, different in configuration and style to anything hitherto produced, has been brought to great perfection after much time and labour to the Manufacturers; and, from the opinion expressed by the first Artists in this department, there is no doubt but it will supersede all other shapes, especially as it will be produced at little or no additional expense to the ordinary shapes.—To be had Wholesale of all the leading City Houses, and Retail of every respectable Mercer and Dealer throughout the Kingdom.



LINGHAM BROTHERS, 170, Hampton-street, Birmingham, sole Manufacturers of the improved WOOD and ZINC MENOGRAPH, or Label for Garden Borders, Flowerpots, &c., in boxes of 100, &c. The Zinc Labels are highly approved of for their lasting durability; can be written upon with the greatest ease, and, when dry, a permanent inscription is secured. Directions for use sent with each box, including bottle of Metallic Ink.

Sole agents in London, G. and J. DEANE, Horticultural Implement Warehouse, 46, King William-street, London-bridge.

HORTICULTURAL SOCIETY OF LONDON.—The EXHIBITIONS OF FLOWERS, &c., in the Society's Garden, will take place on the following SATURDAYS, viz.: May 18, June 8, and July 13. TUESDAY, April 23, *is the last day* on which privileged tickets, at 3*s.* 6*d.* each, are issued to Fellows of the Society. Every Fellow is entitled to 24 such tickets, if paid for on or before that day.—21, Regent-street.

ROYAL BOTANIC SOCIETY, Regent's Park.—GENERAL EXHIBITIONS, WEDNESDAYS, MAY 8th, JUNE 12th, and JULY 3d.

AMERICAN PLANTS.—SATURDAYS, May 25 and June 1. Tickets to be obtained at the Gardens, by orders from Fellows of the Society, price, on or before Saturday, April 27, 4*s.* each; after that day, 5*s.*; or on the days of Exhibition, 7*s.* 6*d.* each; and such Tickets will admit to the Collection of American Plants, from the 3d of June to the 8th, both included.

N. B. Fruit will be exhibited on June 12 and July 3.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.
UNDER THE PATRONAGE OF HER MOST GRACIOUS MAJESTY THE QUEEN.

THE FIRST EXHIBITION for the Season will be held in the Assembly Rooms at the Horns Tavern, Kennington, on WEDNESDAY, April 17, 1850 (open to all Exhibitors), when Prizes will be awarded for the following productions, viz.:—Miscellaneous Plants, Azaleas, Cinerarias, Auriculas, Heartsease, Polyanthuses, and Specimen Plants; in addition to which, a Silver Cup, value 5*l.* 5*s.*, presented by the Committee, will be awarded for the best collection of Miscellaneous Plants, by Mr. Wm. Ivery. For the best 8 Cinerarias, in pots, small Silver Victoria Medal, by Mr. H. Chapman. For the 2d best ditto, small Silver Albert Medal, by R. W. Dutton, Esq. For the best 3 Plants of Oliver's Lovely Ann Auricula, small Silver Albert Medal. And by the Proprietors of the "Gardener's Hive," for the best Seedling Cineraria (not sent out), the Hive Medal, value 10*s.*

Mr. Oakey's band will be in attendance. Admission to Non-Members, from 1 to 6 o'clock, at 1*s.* each. List of Prizes, and the Rules of the Society, may be obtained from

JOHN TAYLOR NEVILLE, Secretary.

Ebenezer House, Peckham, Surrey.

CHELTENHAM GRAND HORTICULTURAL FETE, to take place on THURSDAY, the 20th of June, 1850.—The Committee appointed to award Prizes for the best SCHEDULE for the above Fête, have determined that for general merit, the 1st Prize shall be given to Elizabeth Whiting, of Acacia Cottage, Walham-green, Fulham; and the 2d to John Edwards, F.H.S., of Wace Cottage, Holloway, Middlesex. Unsuccessful candidates wishing to have their Schedules returned, can have them by applying to the Hon. Secretary, Mr. J. D. TAGART, High-street, Cheltenham.

The adopted Schedule to be had on application as above, enclosing a postage stamp.—Cheltenham, April 13.

HART AND NICKLIN, FLORISTS, Guildford, can supply the following, strong and healthy:

PANSIES.—Duke of Norfolk, Aurora, Gem, Orestes, Blooming Girl, Example, Matilda, Caroline, Ondine, Ophir, Juventa, and Constellation, 12*s.* the dozen. Free by post, or to London.

GERANIUMS, new and good, per doz. ... ... 12*s.* 0*d.*
VERBENAS, best named, per doz., free by post 6 0
FUCHSIAS, ,, ,, 6 0

TO CAMELLIA GROWERS.

RENÉ LANGELIER begs to inform the Amateurs of Camellias that he has still some fine CAMELLIA STOCKS, fit for immediate Grafting—they are fine, clean, and healthy—at from 40*s.* to 50*s.* per 100; also a collection of the choicest and most select sorts.—Apply at the Clarendon Nursery, St. Helier, Jersey.

TO NOBLEMEN, GENTLEMEN, AND THE TRADE.

CONRAD LODDIGES avails himself of this opportunity to tender his warmest thanks to the friends of Horticulture who have honoured with their kind patronage his late Father and Uncle so many years, and begs to assure them that nothing shall be wanting on his part to merit a continuance of the confidence which has always been reposed in their house.—The business in future will be continued as heretofore under the firm of CONRAD LODDIGES and Sons, Hackney.

NEW AND SPLENDID ANTIRRHINUMS.

J. FOWLE AND SON intend sending out on and after April the 22d, their choice collection of ANTIRRHINUMS, which they are confident will give entire satisfaction. Catalogues containing a description of the same, also of a fine collection of Verbenas, Petunias, Geraniums, Fuchsias, Phloxes, Lobelias, Herbaceous Plants, &c. &c., may be had on post-paid application to Holland Nursery, Holland-street, Brixton-road, Kennington, Surrey.

N.B. A remittance or reference required from unknown correspondents.

WAITE'S KING OF THE CABBAGES can be had in any quantity at 8*s.* per lb. This Cabbage has proved itself the earliest and best in cultivation.

181, High Holborn, London.

GRASS SEEDS.—Important to Railway Companies. —Ten thousand bushels of mixed Permanent Pasture Grass Seeds can be had in any quantities at 4*s.* per bushel; likewise every other kind of Seeds at such prices, to meet the times, at J. G. WAITE'S, Seed-merchant, 181, High Holborn, London.

RENDLE'S PRICED CATALOGUE OF PLANTS is JUST PUBLISHED, and can be had for one postage stamp.

Ever since our invention of the "Tank System of Heating Horticultural Buildings" (for which a Gold Medal was unanimously awarded to us by the Royal Devon and Cornwall Horticultural Society) we have been enabled to propagate plants in such abundance, with scarcely a failure, that we are enabled to offer them at

VERY REDUCED PRICES.

We shall have at least THREE THOUSAND DAHLIAS and FUCHSIAS ready for delivery after the 10th of May next, as well as a large quantity of Geraniums, Camellias, Indian Azaleas, Cinerarias, Verbenas, Antirrhinums, Chrysanthemums, with a large collection of Greenhouse, Hothouse, and Herbaceous plants, prices of which will be found in our new Catalogue, on application to

WILLIAM E. RENDLE & CO., Seed Merchants, Plymouth.
ESTABLISHED 1786.

SEED AND HORTICULTURAL ESTABLISHMENT, SUDBURY, SUFFOLK.

KITLEY'S GOLIAH STRAWBERRY.

JAMES KITLEY, in again bringing his SEEDLING STRAWBERRY before the notice of the Public, takes this opportunity of thanking those Friends who so liberally purchased in the autumn, and it being now the best time for planting, begs to inform them that he has a fine stock of healthy plants, which have been transplanted. See extracts from the *Gardeners' Chronicle.*

From the *Gardeners' Chronicle.*—"STRAWBERRIES: *J. K.* Your Seedling Strawberry, 'Goliah,' judging from its size and appearance, is worthy of cultivation."

From the Gardeners and Farmers' Journal.—"STRAWBERRIES: *J. K., Lyncombe Vale.* We have great pleasure in bearing testimony to the exquisite flavour of your Seedling Strawberry, 'Goliah.' In our opinion it combines the piquant flavour of the Strawberry with the richness of the Pine, the delicious aroma of which it partakes in equal proportion with the taste. Apart from the queen of fruits, we certainly do not remember anything in this way that conveyed to our senses so delicious a treat as the noble fruit to be known to the world as 'Kitley's Goliah Strawberry.'"

Plants, 12*s.* per doz., or 4*l.* per 100. A liberal allowance to the Trade in plants, when 100 are taken.

Cash orders expected from unknown correspondents.

Lyncombe Vale Nursery, Bath, April 13.

WILLIAM HAMILTON, SEEDSMAN and FLORIST, 156, Cheapside, London, will send, free by post, for 7*s.* 6*d.*, the following 12 varieties of Flower Seeds.

Campanula lepida	Centranthus macrosiphon
Brachycome iberidifolia	Clintonia pulchella
Lobelia ramosus	Nyctarinia capensis
Passiflora capsularis	Passiflora Roddiana
Phlox Drummondii	Podolepis chrysantha
Portulaca splendens	Schypanthus elegans

Also free by post, for 5*s.* each,

TWELVE VARIETIES OF BEAUTIFUL CLIMBERS;
TEN SPECIES OF ORNAMENTAL GRASSES.

25 varieties beautiful Hardy ANNUALS, with the ENGLISH AND SCIENTIFIC NAME, as also MODE OF CULTURE AND TIME OF SOWING, printed on each packet, 5*s.*; 12 vars. 2*s.* 6*d.*; free by post, 6*d.* extra.

CANVAS for Shading Flower-beds, Frames, &c., 4*d.* per square yard.—Brown's Patent Fumigators; Bedding Plants, &c. &c.—156, Cheapside, London.

SUPERB NEW PETUNIAS.

JAMES TURRELL begs to offer to the Public his new and choice Seedling PETUNIAS, which he can recommend with the greatest confidence, feeling assured they will give to all who purchase them great satisfaction. They were selected from a number of fine Seedlings bloomed in 1849; they are perfectly distinct, and of the most refined colours, and in shape unequalled.

EXACTUM.—This Petunia surpasses all others in form—almost a perfect circle; colour a pinkish white, with a fine dark throat, and well calculated to make a fine specimen plant, on account of its being short in the joints. *Vide* Dr. LINDLEY'S opinion in the *Gardeners' Chronicle* of 5th May, 1849: "*H. J. H.* Exactum, pale blush, good in form, not over large, and nicely marked in the centre with violet veins; a very pretty variety." Price 7*s.* 6*d.* each.

LAVENDULA PENCILLATA.—A fine, large, bold flower, veined with dark purple; colour lilac. See *Gardeners' Chronicle* of 5th May, 1849: "*H. J. H.* Lavendula Pencillata, large pale lilac, nicely veined all over the flower with deep violet; a pretty variety, but rather thin." Price 5*s.* each.

EYEBRIGHT.—This Petunia is of extra size, and novel in appearance; ground colour pale pink, shading to white, with a very fine dark eye. See *Gardeners' Chronicle* of 22d Sept., 1849: "*H. J. H.* Pale blush, with dark eye, slightly feathered with violet veins; good in shape and texture." Price 5*s.* each.

CONSPICUA.—Brilliant rose ground, with a dark blood-coloured stripe running up each of the divisions of the corolla; a conspicuous looking variety, not unlike a Convolvulus. See *Gardeners' Chronicle* of 22d Sept., 1849: "*H. J. H.* Rosy pink, eye dark, and slightly feathered; good in shape, texture, and colours, but small." Price 5*s.* each.

The set of four for 20*s.* When three or more of any one sort are ordered at the same time, four plants will be given. Strong plants in the middle of May.

J. T. begs to call the attention of the public to his set of Eight Superb GERANIUMS as advertised on the 2d March in the *Gardeners' Chronicle.*

Providence Nursery, Ramsgate, April 13.

W. IVERY has selected from his Superb Stock of SEEDLING ANTIRRHINUMS (to which four Certificates were awarded at the London Floricultural Society, and were allowed by all who saw them to be first-rate varieties,) Crimson King, 5*s.*; Dowager Queen, 5*s.*; Earl of Dublin, 5*s.*; Princess Royal, 5*s.*; Standard, 5*s.*; Tricolor, 5*s.*; Victoria, 5*s.*; or the set for 30*s.*

W. I. has selected two of the most distinct varieties of PETUNIA from Mr. Young, of New Cross, which can be particularly recommended, and which received two first-class Certificates at the South London Floricultural Society, viz., Herseeana, purplish crimson, jet black throat, a beautiful round flower, 5*s.* Queen, lilac blush, the throat very richly marked, fine substance, 5*s.* Plants of the above will be sent out after the 22d of April.

W. I. can supply good plants of Chauvier's unrivalled VERBENAS, imported this spring. The 12 for 40*s.*

Geraniums, in fine variety,	per dozen—	6*s.*	to	18*s.*	0*d.*

Descriptive Catalogues can be had on application. Post-office orders made payable at Camberwell.

Hanover Nursery, Peckham, near London.

NEW AND STRIKING VERBENA.

ARTHUR MACKIE begs to offer the undermentioned to the attention of Florists, with the fullest conviction that it will give entire satisfaction.

WOODCOCK'S MAGNIFICENT.—A. M. having purchased the entire Stock of this unrivalled Verbena, offers it to the Public with the utmost confidence, being fully persuaded that it will surpass everything yet out in its class. The individual flowers cover a sixpence, and sometimes a shilling. It is of a very free habit and growth, and well suited for grouping. See *Gardeners' Chronicle*, Sept. 15, 1849.—"*W. K. B.* Colour bright rose, fading to pink; a remarkably fine variety, with much the largest flowers we have yet seen."

Fine strong plants at 5*s.* each, free by post. Where three are ordered four will be sent.

MACKIE'S Descriptive Catalogue of Flower and Vegetable Seeds is now ready, and will be forwarded on receipt of two stamps for postage.—Norwich Nursery, Norwich, April 13.

FRUIT TREES, TULIP BEDS, &c.—Those who wish to insure a good crop of Fruit will do well to cover their Wall and other Fruit Trees with "THE TANNED GARDEN NETTING," being the cheapest, most durable, and best protection against Frost, Blight, and Birds. It can be had in any quantity from JOHN KING FARLOW'S Fishing-rod and Net Manufactory, 5, Crooked-lane, London-bridge, at 3*d.* per yard, two yards wide; or 6*d.* per yard, four yards wide. Forwarded on receipt of Post-office order or stamps.

CHEAP! CHEAP!! CHEAP!!!

R. WHITE begs to offer Plants of his splendid collection of VERBENAS, PETUNIAS, FUCHSIAS, &c., at very reduced prices, viz.:

VERBENAS.—Chauvelii, Ocean Monarch, Iphogene, Louis de France, John Salter, Queen of the French, Eppsii, Eclipse (Dufoy's and Epps'), Monsieur Affre, Morphee, Burgundy, Union Jack, Avalanche, White Perfection, Junius, Anacreon, Rose de France, Lady of the Lake, Diversity, Viscomte de Tourval, St. Margaret, Minerva, Cardinal, Eyebright, Princess Alice, Royal Purple, Vulcan, Superb, Valentine de Saveuse, Le Normand, Epomine, Beauty Supreme, La Reine, Satellite Bicolor Grandiflora, Robinson's Defiance, &c.

PETUNIAS.—Louis Napoleon Buonaparte, Princess Alice, Conservative, Berryer, Rosea, La Reine, Apollo, Brilliant, Conspicua, Amœna, Simpsonii, Marchioness of Hastings, Magna Rosea, Splendens, Pet Superb, &c.

Selections from the above, 6s. per doz.; left to R. WHITE, 3s.

FUCHSIAS. — Flavescens, Scarletina Reflexa, Elizabeth, Henry of Navarre, Vesta, Rose d'Amour, White Perfection, Sanspareil, Ellen, Beauty of Dalston, Atrosanguinea, Acantha, One in the Ring, Madame Breary, Leucantha, Goliah, Purity, Bianca, Napoleon, Sir H. Pottinger, Etoile de Versailles, Duchess of Sutherland, &c.

HELIOTROPES.—Voltairianum, Peruvianum, and Triomphe de Leige, 4s. per dozen; Grisan and Souvenir de Leige, 1s. each, or 9s. per dozen.

Also an immense stock of Bedding Plants, consisting of Salvias, Scarlet Geraniums, &c., the whole of which will be ready to send out, in strong plants, on and after April 22d, at 3s. per dozen, package included.—Poole Nursery, April 13.

This Advertisement will not be repeated.

DESCRIPTIVE PRICED CATALOGUES OF OUR EXTENSIVE COLLECTION OF SEEDS AND PLANTS supplied, prepaid on receipt of four penny stamps.

Remittances requested from unknown correspondents. Post-office orders to be made payable to BASS and BROWN, or to STEPHEN BROWN. Goods carriage free to London, and with orders of 40s. extra plants presented.

BASS and BROWN'S Seed and Horticultural Establishment, Sudbury, Suffolk.

STORY'S SUPERB SEEDLING FUCHSIAS.—2-48 SOUTH DEVON.—A very distinct and elegant flower; tube and sepals light rosy crimson, long and well reflexed, showing a most compact elegantly formed light blue corolla. The flowers are produced on long footstalks and in great abundance. This is a most distinct variety, and one that will give satisfaction to purchasers.—Strong plants, 7s. 6d.

* 3-48 DUPLEX.—A most remarkable variety, from its invariably producing a double rich deep purple corolla. The tube and sepals are bright scarlet, well reflexed, of good substance. It is a dwarf, compact grower, and an abundant bloomer. It will be a general favourite.—Strong plants, 10s. 6d.

6-48 MULTIPLEX.—This, as the name designates, is another double corolla flower, but perfectly distinct from Duplex. The tube and sepals are bright crimson, and well reflexed, shewing to a great advantage the intense purple corolla, which, for doubleness, resembles a large double Violet. It is a very free bloomer, and a variety that was greatly admired by those parties who saw it in flower.—Strong plants, 10s. 6d.

7-48 IGNEA.—A most splendid flower of extra size, and extraordinary brilliancy, both in its crimson tube and sepals, and deep purple corolla. The tube is long, symmetrical, and of great substance, without excrescence of any kind. Sepals sufficiently reflexed to show to advantage its beautifully formed corolla. It is certainly a first-class flower, and warranted to give satisfaction.—Strong plants, 10s. 6d.

* 8-48 UNIQUE.—This is a beautiful flower, of large size; tube and sepals bright glossy scarlet, of great breadth and substance, without the least wortiness or roughness of any kind. Corolla deep purple and well formed. A most abundant bloomer, two flowers being produced at the axil of the leaves. In the "Florist" for September and November last, it is highly commended, and described as a "very fine flower." The habit of growth and blooming is excellent. It is altogether a first-rate flower, and strongly recommended.—Strong plants, 10s. 6d.

9-48 MIRABILIS.—A great favourite with those parties who saw it in bloom. An early bloomer, tube and sepals scarlet, well formed and reflexed, corolla fine lively purple, bell-shaped, a most abundant bloomer, and a striking plant. Habit and foliage very good; a most distinct variety.—Strong plants, 7s. 6d.

* 11-48 STRIATA.—A most novel variety. The corolla which is crimson, being singularly striped with purple like a flake Carnation. It is an abundant bloomer, and invariably comes true to its striped character. It was much admired when in flower.—Strong plants, 7s. 6d.

The three sorts marked thus * are figured in "The Florist," for March last. The set of seven for 2l. 10s. for cash (prepayment). A selection of either four for 1l. 15s. for cash (prepayment.) The usual discount to the trade.

Messrs. VEITCH and SON have much pleasure in offering the above beautiful FUCHSIAS. They are Seedlings raised in 1848, and proved in 1849, by W. H. Story, Esq., of Whitehill, Newtown Bushell, and were selected from a vast number of Seedlings. They are all perfectly distinct, and worthy of general cultivation. Mr. Story's well-known character as a raiser of Seedlings will be a sufficient guarantee that he would permit nothing to be sent out with his name attached that was not of first-rate character, and calculated to give satisfaction.

Strong well-established plants will be ready for delivery on and after Monday the 15th of this month.

N. B. A remittance or reference from unknown correspondents required; this will be strictly adhered to.

Exeter, April 13.

RUSSIAN SUPERB VIOLETS.

ROBERT SHACKELL, in again bringing his Seedling VIOLETS to the notice of the public, takes this opportunity of thanking those friends who have so liberally purchased of him; and begs to inform them that from the middle of March until the beginning of May is the best time for planting these beautiful and easily cultivated flowers.

R. S. refers those who are not yet possessed of them to the opinions of the following Horticultural Editors:

"Gardeners' Journal," Oct. 20, 1849.—"VIOLETS: R. S., Bath.—We have much pleasure in testifying to the improvements made by you in this tribe of flowers, as evident in the comparison united by a close inspection of the sample sent of the old Russian Violet and your Seedling Russian Superb. The following points of difference exist, and to them we call the attention of all lovers and growers of this odoriferous race of flowers. The Russian Superb is a better formed flower than the old Russian, with much larger petals, better shaped, and more fully expanded, showing to advantage a nice white centre, the whole bloom being free from that crumpled, half closed appearance, so general with these flowers. The perfume is delicious, and the extreme abundance of bloom passes all question. On the plant before us there are 27 blooms, finely expanded, and of brilliant colour; and the potted plant fully bears out your description, of its inclination to form a tree violet. The fact of its beginning to bloom in August and continuing until March is a recommendation of itself. In our opinion Russian Superb will entirely supersede the old Russian for all the purposes for which this variety has been hitherto cultivated, its extreme pre-eminence in point of beauty, as well as other properties, being indisputable."

"Florist," Nov. 1st, 1849.—"SEEDLING RUSSIAN SUPERB: R. S., Bath.—Fine bunches and in good condition. This is a very great improvement upon the original variety in the size and form of the flowers. Its fragrance is quite equal, and the foliage very good. It completely eclipses its predecessor, and is a valuable seedling."

"Midland Florist," Dec. 1st, 1849.—"THE RUSSIAN SUPERB VIOLET.—About the middle of last month we received from Mr. SHACKELL a most beautiful bouquet of this excellent Violet. It is a seedling raised by him from the old variety, which it much surpasses in size, both of flowers and foliage. It is very fragrant, and a great and decided acquisition."

"Gardeners' Hive," Jan. 12th, 1850.—"Mr. SHACKELL, Bath.—The bouquet of blue and white seedling Violets reached us in safety, and are certainly the best that ever came under our notice. The foliage alone is a recommendation, but the increased size of the blossoms surpasses all others in cultivation. The petals are of greater breadth than ordinary varieties, and, consequently the flower is more symmetrical; but this is not all—the stems are much longer, which is a great advantage, and (though last, most important) the fragrance is powerful and delicious. For these improved out-door winter-flowering pets of the ladies you will, no doubt, find an extensive sale."

"The Gardeners' Magazine of Botany," Feb. 9th, 1850.—"VIOLETS.—We received from Mr. R. Shackell, of Bath, a few days back, a bunch of his Russian Superb Violets, remarkable for their large size, robust habit, fine form, and delicious scent. This is a very decided improvement upon the old Russian Violet, and must soon come into general cultivation where Violets are admired—and where are they not? Accompanying the above was a bunch of seedling white Violets, of exquisite form, pure in colour, and remarkably sweet. Both of these varieties, though humble, are decided acquisitions."

Mr. Glenny, in the "Country Gentleman."—"THE NEW VIOLET, RUSSIAN SUPERB.—We have received from Mr. Shackell a bunch of these Violets and a plant to grow; and, although we are slow to pronounce anything actually new until we have grown it side by side with the best of old ones, we cannot help saying that the flowers are larger, more symmetrical, and stronger in fragrance than we have ever found the ordinary Russian Violet. The white seedling, which accompanies the other is an acquisition; and assuredly, whether they are sufficiently novel to be all we require or not, we would rather give the price for either, to be of such a breed, than have the best of the Russians and Whites we have hitherto seen for nothing."

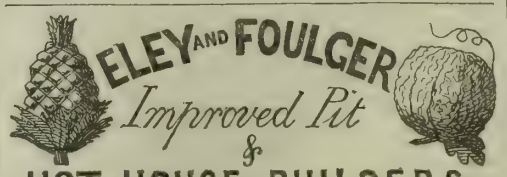
Dr. Lindley, in the *Gardeners' Chronicle*, March 2d, 1850—"RUSSIAN SUPERB VIOLET.—Mr. R. SHACKELL, of Bath, has sent us, two or three times, specimens of what he calls by this name. It is very difficult to form a just opinion concerning Violets without growing them; but we should say that Mr. SHACKELL's have all the appearance of being a very fine, robust variety, as we believe it to be."

A bouquet of the Russian Superb Violet was recently sent to her Majesty, and has been officially acknowledged to the grower as proving acceptable to her Majesty.

OPINIONS ON THE WHITE WINTER-BLOOMING VARIETY.

Dr. Lindley, in the *Gardeners' Chronicle*, Nov. 3d, 1849.—"VIOLETS: R. SHACKELL.—Your White Seedling is large and pretty. It is a good white."

G. Glenny, in the "Country Gentleman."—"The best white we have seen."



"Gardeners' Journal," Nov. 10th, 1849.—"VIOLETS: R. S., Bath.—We have much pleasure in again testifying to your success in raising Violets. The white variety, just received, is an improvement in its class. As a sweet-scented, winter-blooming flower, it is very desirable; and, were comparison instituted between your seedling and other sorts, on the score of colour, we should not hesitate to pronounce your White Seedling good. And relieved, as these blooms are by the dark green foliage which surrounds them, it shows to advantage; while its exquisite fragrance secures favour the moment it is seen."

Price of the Russian Superb Violet, 18s. per dozen; Winter-blooming White ditto, 9s. per dozen. Five other Sweet-scented varieties, 3s. per dozen.

ROBERT SHACKELL,
LOCKSBROOK NURSERY, UPPER BRISTOL ROAD, BATH.

FRUIT TREES.—Wanted, Several Thousand Fruit Trees. Nurserymen having a surplus stock of Standard, Half-standard, or Dwarf Apple or Pear Trees, which they are willing to sell cheap, are invited to send the particulars of the same to Mr. VARDEN, 154, High-street, Southwark, with the lowest price per 1000 they will accept. The trees to be delivered next autumn. Gooseberry, Currant, and Plum trees are also wanted.

FOR SALE, 80 bushels of Green-top Yellow Bullock, and 40 ditto of Purple-top Swedish TURNIP SEED, the growth of 1849, transplanted and carefully selected. For price, &c., apply to Mr. BRYAN CLARKE, Farmer, Tuxford, Nottinghamshire.

HOT-WATER APPARATUS MANUFACTURERS, and INVENTORS of the DOUBLE SADDLE CAST-IRON BOILERS, proved the most superior. Can be highly recommended by the Nobility. Prices equal to all competition.—Address, City-road, near the Toll-gate, London; Manufactory at Old-street.

FERN SEEDS.

GEORGE BENNET begs to inform the lovers of Ferns that he has still a large quantity of NEW ZEALAND FERN SEEDS, and has much pleasure in announcing that they have vegetated. Price 2s. 6d. per packet. The names of the varieties are as follows: No. 1, Todia sp., variety australis; No. 2, Alsophylla medullaris, fine variety; No. 3, Cyathea dealbata; No. 4, mixed varieties of Hymenophyllum, Trichomanes, Adiantums, &c.; No. 5, mixed varieties of Alsophylla dealbata, or Silver Tree Fern; No. 6, Cyathea medullaris. A remittance must accompany the order either in postage stamps or Post-office order, made payable at Coventry, to GEORGE BENNET, Brandon, Warwickshire, near Coventry.

MEETINGS AT WORTON COTTAGE, ISLEWORTH, for the Display and Examination of SEEDLING FLORISTS' FLOWERS, and other objects of Horticultural Interest.

The Editor of the FLORIST AND GARDEN MISCELLANY particularly requests that all Seedlings for the opinions of the Censors of that work may be posted, as far as practicable, so as to reach Mr. BECK, Isleworth, Middlesex, on the Wednesday morning of each week. Parties desirous of attending personally with their productions, by taking the 4.35 o'clock train for Isleworth from the Waterloo Station, will be put down within a few minutes' walk of Worton Cottage.

The next Meeting will be held on Wednesday, April 17th, and each succeeding Wednesday, at 5 o'clock, P.M.

An Artist will attend these Meetings, to take coloured memoranda of anything particularly striking.

TO MARKET GARDENERS.

THE ADVERTISER, wishing to acquire practical knowledge of Market Gardening, is willing to communicate with a party in that line holding ground, who, for a moderate premium, would instruct him therein.—Apply by letter, prepaid, to R. M., Post-office, 72, Farringdon-street, City.

JOHN BAILY, PURVEYOR TO HER MAJESTY AND H.R.H. PRINCE ALBERT, 113, Mount-street, Grosvenor-square, London, Dealer in every description of Useful and Ornamental POULTRY and WATER-FOWL, Dorking, Hambro', Spanish, Polish, and Cochin China Fowls. Gold and Silver Spangled Bantams. All sorts of Pea Fowls. Gold, Silver, Pied, and Ring-necked Pheasants. Tame-bred Pheasants in any numbers. Live Partridges for turning out.—Priced Lists and Estimates forwarded by post, on application.

THE COTTAGER'S STOVE will cook sufficient for a Family of a dozen persons with one pound of Coal or Coke per hour, and is well adapted for Emigrants.—May be seen in operation daily at the Manufacturer's, Messrs. BENHAM and SON'S, 19, Wigmore-street, and Messrs. D. and E. BAILEY, 272, High Holborn, London.

FIRST-RATE SEEDLING FUCHSIAS, VERBENAS, AND PETUNIAS.

FUCHSIAS.

KOSSUTH.—Tube and sepals bright crimson, broad, and well reflexed; corolla violet purple, large and well formed; the habit and growth of Coralina, with blooms twice the size; of bell-like form, with remarkably beautiful foliage, together with its abundance of blooms. G.S. has no hesitation in saying that it is the best dark Fuchsia ever offered to the public. It has taken first-class Certificates at the Royal South London, the Central Floricultural Society, and North London Shows, the only places exhibited. It is also highly spoken of by the Editors of the *Gardeners' Chronicle*, Gardeners' Journal, The Hive, &c. Strong plants 10s. 6d. each, April 22.

QUEEN OF MAY.—A fine large stout flower, tube and sepals white, the latter with a slight tip of green; corolla rosy lilac, large, and well formed; a fine variety. Was awarded a first-class Certificate at the Royal South London in July last. 5s. per plant in April.

ORION.—Shown at the Royal Botanic Gardens as Wonder. This will be found to be by far the largest Fuchsia yet offered; a remarkably free bloomer and good habit; colour, tube and sepals dark crimson, corolla rose purple; of good form; a noble variety. Was awarded a first-class Certificate at the North London Floricultural Society. Plants in April, 5s.

VERBENAS.

G. S., in offering the following Six Seedling VERBENAS, begs to say that they are of the most exquisite form, their colour decided, large, and of excellent habit.

MONITOR (Smith).—A most beautiful rich rosy scarlet, with bright pink eye, corolla large and well formed. A most superb variety. Awarded a first-class Certificate at the London Floricultural Society.

CALLIOPE (Smith) is a bright rose, suffused on the edge and richly blotched, with crimson centre and yellow eye. "The form of this variety is a decided improvement on many out; size of pip large, a fine trusser."—Gardeners' Journal. A first-class Certificate awarded at the London Floricultural Society.

DESDEMONA (Smith).—"Salmonish pink, richly blotched with rosy scarlet, centre greenish lemon, form pretty good, size of pip and truss desirable."—Gardeners' Journal. A first-class Certificate at the London Floricultural Society, and a premium as the best seedling of 1849 at the Royal South London in September last.

MASTERPIECE (Smith) is a fine flower, very showy, if not of first-rate form; colour a magnificent purplish crimson, centre greenish lemon, eye white, a noble trusser. "Mr. Smith's Seedling Verbenas were very good."—Gardeners' Journal, Sept. 1.

LAURA (Young).—A bright rich salmon, the eye being surrounded with bright crimson, truss large, a most beautiful variety. A first-class Certificate awarded at Camberwell.

LETITIA (Young).—A beautiful delicate peach colour, with a blotch of bright rosy pink, very distinct and fine.

G. S. begs to say that the above six will be sent out in good strong plants by the 22d April, at 5s. each, or 25s. the set.

PETUNIAS.

G. S. has much confidence in offering the following three Seedling PETUNIAS, raised by Mr. Young, of New Cross, together with his "North London."

PICTA.—Form excellent, ground colour blush, with a deep margin of rose-pink; throat pale primrose, beautifully pencilled with purple; good habit. Was awarded a first-class Certificate at the Royal South London in July, 1849.

LETITIA.—Form excellent, ground colour a beautiful mottled rosy lilac, the corolla being divided into five distinct compartments with a deep purple, the throat pale primrose, which shades softly into the ground colour; excellent habit.

YOUNGII.—A rich purplish crimson, with a jet black throat, corolla of great substance, a superb round flower, and excellent habit. Was awarded a first-class Certificate at the Royal South London in July, 1849.

NORTH LONDON (Smith.)—Ground colour bluish pink, beautifully striped with rich purplish lake, good size and habit; awarded a first-class Certificate at Highgate. Plants in April, 3s. 6d. each.

G. S., in offering the above, warrants them to be distinct and very superior varieties.

G. S. can also supply all the Foreign and English Novelties.

Post-office orders from unknown correspondents made payable at Islington.

G. SMITH, Tollington Nursery, Hornsey-road, Islington.

UNEQUALLED NEW SEEDLING ANTIRRHINUMS.

ROBERT WHIBLEY begs to refer the reader to his Advertisement of the 9th of February last.
Nursery, Kennington, London.

JAMES WHOMES, Royal Pelargonium Nursery, Windsor, can supply fine Plants of HOYLE'S "CRUSADER" GERANIUM at 36s. per dozen; and every other fine variety equally cheap.—April 13.

VERBENA—"WONDERFUL."

G. MOORE begs to refer the Readers of this Paper to his Advertisement of the 2d of February.
Perry Barr, near Birmingham, April 13.

PELARGONIUMS AND NEW PLANTS, MANY OF THEM FROM CALIFORNIA AND CHINA.

H. GROOM, Clapham Rise, near London, by Appointment FLORIST TO HER MAJESTY THE QUEEN, and to HIS MAJESTY THE KING OF SAXONY, begs to say that his CATALOGUE OF PELARGONIUMS AND NEW PLANTS is ready, and will be forwarded by post on application.

FLOWER SEEDS FREE BY POST. — One Hundred packets of the newest and best sorts for 18s.; Fifty for 10s.; Twenty-five for 6s. Selection can be made from RENDLE'S Descriptive Catalogue of Flower Seeds.

GERMAN SEEDS.—*We have a large stock of all the best varieties* (*See our Advertisement, page* 177, *March* 23, "Gardeners' Chronicle"), *including Stocks, Asters, Wallflowers, Balsams, Larkspurs, Hollyhocks, Zinnias, &c.*

For particulars apply to WILLIAM E. RENDLE and Co., Seed Merchants, Plymouth. Established 1786.

CHOICE SEEDLING PETUNIAS.—We have the pleasure to offer the following varieties of our own raising, which have been selected as first-rate from a large number of other Seedlings, and we trust will give equal satisfaction to the varieties we have hitherto sent out. To be sent out on April 20.

Magnificent, a fine rich crimson, colour and shape of "Brilliant" sent out last year, but having darker veins	5s. 0d
Castor, a large and distinct lilac, with a very rich dark purple throat	3 6
Pollox, a large silvery blush, with a dark rich purple throat	3 6
Orion, a rich lively crimson lake, of fine form	3 6
Syren, pure white, with a rich bright pink throat, good round form	3 6
Cassandra, French white, lilac pink throat, veined, edges of the corolla blotched with lively pink, large and fine	3 6

The usual allowance to the trade by taking the set, or for three plants of a sort.

12 new varieties of last season	12 0
12 superior varieties	9 0
12 fine ditto	5 0
25 varieties in choice assortment	15 0

The above free by post if required.
BASS AND BROWN,
Seed and Horticultural Establishment, Sudbury, Suffolk.

WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

WM. WOOD AND SON are now issuing copies of their new CATALOGUE OF STOVE AND GREENHOUSE PLANTS, to which is added Descriptive Lists of all the newest Camellias, Cinerarias, Fuchsias, Verbenas, Petunias, and Chrysanthemums, with a very extensive collection of plants adapted for bedding.

W. W. and S. have a large stock of Dwarf Roses in pots. April and May are the best months for planting out the above. They will be supplied as under, the selection being left to themselves.

Hybrid Perpetual and Bourbon Roses ...	12s. to 18s. per dozen.
Tea-scented and Noisette do.	12s. to 18s. "
China and climbing do.	9s. to 12s. "

Catalogues will be forwarded, GRATIS, on application.

NGAINES begs to inform the admirers of Fancy GERANIUMS, he intends sending out on Monday next the following Seedlings: Gaines's Parodi, Lady Louisa Cornwallis, Elegans, Priam, Nina, Queen Superb, Signora Carolinii, Odorata variegata; also he has good strong plants of his Hero of Surrey and Cerise Unique.

On the 1st of May will be ready for delivery, his superb new Seedling DAHLIAS Lady Auckland, Empress of Yellow, Lord Hardinge, Fancy do., Princess Louisa, Hero, Desdemona, Rotundiflora and Atalanta. Opinion of this Paper (1849), see August, No. 34; September, No. 38. Gardeners and Land Stewards' Journal, August, No. 32; September, No. 35.—A Descriptive Catalogue of the above, including Calceolarias, Dahlias, Pelargoniums, Fuchsias, Cinerarias, Chrysanthemums, Azaleas, Verbenas, Rhododendrons, &c., may be had by applying at the Nursery, Surrey-lane, Battersea, April 13.

The Gardeners' Chronicle.

Antiquarian ..8 P.M.
FRIDAY, April 19—Royal Institution ..8½ P.M.
SATURDAY, April 20—Asiatic ..2 P.M.
Westminster Medical ..8 P.M.

THE plan of growing early crops by aid of WASTE STEAM, as contemplated by the writer in the "Journal of the French Polytechnic Society," does not appear to have had any reference to a protecting roof, but to have been limited to the gain derivable from the mere augmented heat of the soil. The good effect by this means produced upon Pine-apples, daily exposed to the open air, is particularly referred to.

That all flowers will be brighter, and all fruits higher flavoured, if ripened under the free and full influence of the atmosphere, has long ago been shown by us, and is familiar to all observing gardeners. Nor has this difference been affected in the least by the increased light now obtained by large and clear sheets of glass. Augmented light will in no degree compensate for insufficient ventilation; on the contrary, it renders the free admission of air more than ever necessary. If, then, glass could be dispensed with, and its place supplied by ground heat, an important gain, as well as a saving, would be the result. This was sufficiently proved by the very interesting experiments tried in Lady ROLLE's Garden at Bicton, of growing Pine-apples in the open air. We venture to say no such *high-flavoured* Pine-apples had ever before been tasted in England. But the Bicton experiment began in May, and ended in the autumn; the Pine-apple plants merely swelled and ripened their fruit in the open air; all the preparation for fruiting was made beneath glass. The question then still remains whether by permanent ground-heat the Pine-apple, or any such plant, can be made to bear our winters, and also whether, if that be so, the yet more tender leaves and flowers of forced hardy plants would thus be enabled to dispense with artificial protection.

Upon this point very little information exists—no one having instituted a series of experiments to decide it. We know, indeed, that in what are called hot countries severe frosts are experienced for many nights in succession without injury to the vegetation, if the air be dry—as in New Holland, for example. We have also before us the very curious fact, for which we are indebted to Messrs. LEE, of Hammersmith, that some Pine-apple plants having been accidentally frozen hard in a dry neglected Pinery, nevertheless survived and produced fruit, which fruit we tasted; and, although small, it was quite as good as half the Pine-apples sold in the markets. But in these cases the dryness experienced is precisely what cannot be secured in the open air in Great Britain, and therefore they furnish no data upon which any opinion on this question can be formed.

The following experiment is more useful. In December 1848, some plants were plunged in soil in a Melon pit, the soil being heated; but the plants above it exposed to the open air, unprotected by glass or other covering. The following was the result:

SURVIVED.	
Edwardsia flexuosa	Echeveria secunda
Berberis tenuifolia	Abutilon striatum
Habrothamnus elegans	Phœnix dactylifera
Acacia melanoxylon	Dion edule
„ species, New Holland	Opuntia, species
	An Agave, from Mexico
Melaleuca pungens	Heliotropium peruvianum
Heimia salicifolia	Statice mucronata
Camellia Welbankii	Fuchsia (The *Gem*)
Orange (stock)	Ceanothus azureus.

DIED.	
Passiflora hederæfolia	Habrothamnus fasciculatus
„ Bonapartei	Genista canariensis
Begonia suaveolens	Acacia pulchella
„ uncinata	„ albicans
Candollea tetrandra	Pelargonium (Ivy-leaved)
Callistemon marginatus	Statice Dickensoni.
Templetonia glauca	
Anona Cherimolia	

Lowest temperature at night during the trial 19°
Average night temperature during the trial... 33°.41
Average temperature of the soil in which the plants were plunged ... ... 60°.07
